1. In a proclamation issued on April 8, 2025, President Donald Trump purported to exempt nearly one-third of coal-fired power plants across the country from mercury and other toxic air pollution standards critical to protecting Americans, especially infants and children, from a range of harmful health impacts and risks including cancer, birth defects, and developmental harms in children. *Regulatory Relief for Certain Stationary Sources to Promote American Energy*, 90 Fed. Reg. 16,777 (Apr. 21, 2025) (attached as Exhibit 1) ("Exemption Proclamation"). President Trump declared those sweeping exemptions by invoking Section 7412(i)(4) of the Clean Air Act, 42 U.S.C. § 7412(i)(4), a narrow and never-before-used

ED_021114D_00001846-00002

provision authorizing the President to provide a limited exemption from compliance with hazardous air pollutant emission standards in instances where "the technology to implement" the relevant standard is "not available" and when exempting a facility "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4). Now, for the first time in the history of the Clean Air Act, President Trump and the U.S. Environmental Protection Agency ("EPA") seek to exploit that narrow provision to indiscriminately exempt scores of coal-fired power plants. Many of the exempted power plants have already installed and are actively using the technology sufficient to meet the targeted mercury and other toxic air pollution standards—technology that EPA itself determined was available in a final rule issued just over a year ago, based on an ample record developed through public notice and comment.

2. Congress authorized use of Section 7412(i)(4) to exempt a stationary source only where the technology to implement a standard is not available. President Trump violated this limitation by issuing exemptions where the technology is available but where he wishes to relieve sources of their need to expend costs to comply with pollution standards while the Administration undertakes proceedings to repeal them. The Clean Air Act does not permit this use of Section 7412(i)(4) authority. The Exemption Proclamation is illegal and must be invalidated.

3. The Exemption Proclamation exempts 68 coal-fired power plants from Clean Air Act standards EPA adopted in 2024 to modernize existing pollution standards for highly toxic substances such as mercury, arsenic, and nickel that are emitted by coal-fired power plants in light of developments in pollution control technologies. *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review*

of the Residual Risk and Technology Review, 89 Fed. Reg. 38,508 (May 7, 2024) (attached as Exhibit 2) ("2024 Rule").

4. The 2024 Rule established more protective limits on mercury emissions from power plants burning lignite coal, and lowered emission limits for arsenic, nickel, and other toxic metals from all coal-fired power plants. EPA also required plants to demonstrate compliance with the arsenic, nickel, and other toxic metals standard using continuous emissions monitoring systems that provide real-time feedback, and tightened pollution standards for power plants during their startup periods.

5. EPA required power plants to comply with the startup standard by January 2025 and established a compliance deadline of July 2027 for the lignite mercury standard, the arsenic, nickel, and other metals standard, and the continuous emissions monitoring requirement. From 2028-2037, the standards were expected to reduce significant quantities of mercury, arsenic, nickel, and other toxic metals, delivering cleaner, healthier air and water nationwide from Texas and North Dakota to Pennsylvania and North Carolina.

6. The President's Exemption Proclamation jeopardizes the realization of these public health benefits without any proper basis. Section 7412(i)(4) authorizes the President in exceptional circumstances to exempt a "stationary source" only if the President "determines" that "the technology to implement such standard is not available" for that source and "it is in the national security interests" to do so. The President violates these firm statutory requirements by issuing exemptions to coal-fired power plants based on a conclusory and false claim that "[t]he technology to implement the Rule is not available" and that "[s]uch technology does not exist in a commercially viable form sufficient to allow implementation of and compliance with the Rule by its compliance date of July 8, 2027." To the extent these and the other claims in the

Exemption Proclamation operate as "determinations," they cannot support the exemptions issued because they fail to make any determination grounded in the factual circumstances specific to the 68 coal-fired power plants exempted, as the statute requires.

7. The exempted power plants vary with regards to the actions they need to take to comply with the 2024 Rule, but the Exemption Proclamation treats them equally with a broad brush, does not identify which control technologies any of the 68 coal-fired power plants require to implement the 2024 Rule, and does not identify which of those control technologies are unavailable. The President has not, in the Exemption Proclamation itself or otherwise, provided any factual basis, reasoning, or other support for the exemptions.

8. Moreover, the Exemption Proclamation's claims are contradicted both by EPA's own recent findings just 11 months earlier that that technology is readily available and by the fact that technology sufficient for meeting the standards is already used by many coal-fired power plants, including by some of those the President exempted. *See, e.g.*, 89 Fed. Reg. 38,508, 38,531, 38,536-37, 38,539.

9. In 2024, EPA found that coal-fired power plants that burn lignite coal could lower mercury emissions by using more of the same chemical additives those plants were already using to comply with existing, less stringent, mercury limits. 89 Fed. Reg. at 38,540. EPA found that coal-fired power plants responsible for generating 93 percent of total coal-fired energy had already demonstrated the ability to meet the revised lower limit for arsenic, nickel, and other metals with existing controls and that this standard could be met using available control technology. *Id.* at 38,530. EPA found that approximately one-third of the existing coal power plant fleet was already using continuous emissions monitoring systems, *id.* at 38,535, and that these monitoring systems provide superior "certainty, accuracy, transparency, and granularity"

ED_021114D_00001846-00005

while costing only slightly more than the existing requirement to conduct pollution emissions testing a handful of times per year. *Id.* at 38,536-37. EPA also found that the vast majority of plants were already able to meet the startup standard the 2024 Rule required for all coal-fired power plants. *Id.* at 38,551.

10. The Exemption Proclamation does not rest on findings of any coal-fired power plant's actual inability to comply with the 2024 Rule at all, much less to a degree that implicates national security. Nor does it contain such findings for each of the named plants that it purports to exempt from clean air standards. Rather, the real reason and basis for the exemption, as is apparent from the Proclamation itself and the circumstances leading to its issuance, is to provide "regulatory relief" to coal plants in furtherance of President Trump's policy "to promote American energy" through deregulation as baldly stated in the Exemption Proclamation's title, "Regulatory Relief for Certain Stationary Sources to Promote American Energy." 90 Fed. Reg. 16,777 (Apr. 21, 2025). That is not a permissible basis for granting Section 7412(i)(4) exemptions.

11. President Trump and his administration have made no secret of their intent to undo a suite of public health and environmental regulations adopted by the last administration. In March, EPA Administrator Lee Zeldin declared "the greatest day of deregulation our nation has seen," announcing the rollback of 31 regulations, including the 2024 Rule. EPA, News Release, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://www.epa.gov/newsreleases/epa-launches-biggest-deregulatory-action-us-history.

12. New presidential administrations that wish to reconsider and revise regulations generally must comply with statutory administrative procedure requirements such as notice-and-comment rulemaking under the Administrative Procedure Act and the Clean Air Act. The Trump

ED_021114D_00001846-00006

administration announced in a March press release and fact sheet that they would "reconsider" the 2024 Rule because of "concerns" about compliance costs and burdens on the coal industry. At the same time, EPA also announced that, "[t]he Trump Administration is considering a 2-year compliance exemption via Section [7412](i)(4) of the Clean Air Act for affected power plants while EPA goes through the rulemaking process." EPA, News Release, *Trump EPA Announces Reconsideration of Air Rules Regulating American Energy, Manufacturing, Chemical Sectors (NESHAPs)* (Mar. 12, 2025), https://www.epa.gov/newsreleases/trump-epa-announces-reconsideration-air-rules-regulating-american-energy-manufacturing. On June 11, EPA issued a proposed rule to repeal certain requirements of the 2024 Rule. EPA, News Release, *EPA Proposes Repeal of Biden-Harris EPA Regulations for Power Plants, Which, If Finalized, Would Save Americans More than a Billion Dollars a Year* (Jun. 11, 2025), https://www.epa.gov/newsreleases/epa-proposes-repeal-biden-harris-epa-regulations-power-plants-which-if-finalized-would.

13. In disregarding the limitations imposed by Section 7412(i)(4), Defendants improperly circumvented the procedural requirements (including public comment) that properly constrain agency decisions to weaken, or delay application of, pollution standards. This exercise was plainly unlawful. The Clean Air Act authorizes permitting authorities to provide sources one-year compliance extensions "if necessary for the installation of controls." 42 U.S.C. § 7412(i)(3)(B). Other than that, EPA has authority to revise pollution standards and compliance deadlines where the statute allows,[1] but only after engaging in the public notice and comment process mandated by the Clean Air Act in 42 U.S.C. § 7607(d)(1), addressing procedural requirements for rulemaking, and only when the substantive standards of 42 U.S.C. § 7412,

[1] The compliance deadlines for rules promulgated under 42 U.S.C. § 7412 are strictly managed by Section 7412(i)(3)(A).

which governs pollution standards for the hazardous air pollution at issue here, are met. The President lacks authority to exempt coal-fired power plants from emission standards so that EPA can revise or undo the standards themselves.

14. Plaintiff environmental and public health groups bring this action challenging the Exemption Proclamation as issued in violation of the Clean Air Act and as beyond the President's lawful authority. Plaintiffs seek an order declaring the Exemption Proclamation to be unlawful and invalid and enjoining EPA and its Administrator from implementing or giving effect to it.

JURISDICTION AND VENUE

15. This Court has subject matter jurisdiction under 28 U.S.C. § 1331 because this is a civil action arising under laws of the United States, including the Clean Air Act.

16. Venue is proper in this Court under 28 U.S.C. § 1391(b) and (e) because Plaintiff Environmental Integrity Project resides in this judicial district, because Defendants reside in this judicial district, and because a substantial part of the events giving rise to the claim occurred in this judicial district.

17. The Court has authority to enter a declaratory judgment and to provide injunctive relief pursuant to Rules 57 and 65 of the Federal Rules of Civil Procedure; the Declaratory Judgment Act, 28 U.S.C. §§ 2201-2202; the All Writs Act, 28 U.S.C. § 1651; and the Court's inherent equitable powers.

18. Although the Clean Air Act provides for judicial review through "[a] petition for review of action of the Administrator" of "any emission standard or requirement under section 7412 . . . or any other nationally applicable regulations promulgated, or final action taken, by the

ED_021114D_00001846-00008

Administrator" in the D.C. Circuit, 42 U.S.C. § 7607(b), the Act does not expressly provide for judicial review of the actions here at issue.

PARTIES

19. Plaintiff Air Alliance Houston is a nonprofit organization that works to improve air quality and public health through research, education, and advocacy. Founded in 1988, Air Alliance Houston's mission is to reduce the public health impacts of air pollution in Harris County and Houston, Texas, and the surrounding region. This includes the health impacts of toxic power plant emissions. Air Alliance Houston pursues its mission by conducting applied research on air pollution, educating its members and the community about the harms of air pollution and its sources, and advocating for improvements at the local, state, and national levels. The organization regularly engages with Fort Bend County community members, to provide greater transparency about members' exposure to harmful emissions.

20. Plaintiff Center for Biological Diversity ("CBD") is a national 501(c)(3) nonprofit conservation organization. CBD's mission is to ensure the preservation, protection, and restoration of biodiversity, native species, ecosystems, public lands and waters, and public health through science, policy, and environmental law. Based on the understanding that the health and vigor of human societies and the integrity and wildness of the natural environment are closely linked, CBD is working to secure a future for animals and plants hovering on the brink of extinction, for the ecosystems they need to survive, and for a healthy, livable future for all of us. Part of CBD's core mission is to protect and improve air quality across the country, including by reducing pollution from power plants. CBD is headquartered in Tucson, Arizona, with offices and members throughout the United States, including Alaska, the District of Columbia, and New York.

ED_021114D_00001846-00009

21. Plaintiff Citizens for Pennsylvania's Future ("PennFuture") is a nonprofit organization that works to aid the transition to a clean energy economy in Pennsylvania and beyond; to protect our air, water, and land; and to empower citizens to build sustainable communities for future generations. PennFuture advocates for and advances legislative action at the state and federal levels; educates and provides advocacy opportunities for the public; and enforces environmental laws and advocates for the transformation of public policy.

22. Plaintiff Clean Air Council ("CAC") is a nonprofit, membership-based organization dedicated to protecting and defending everyone's right to a healthy environment, including everyone's right to breathe clean air. It is headquartered in Philadelphia, Pennsylvania, with offices in Philadelphia and Pittsburgh, Pennsylvania and Wilmington, Delaware. CAC engages in community advocacy, regulatory work, and litigation with a primary goal of improving air quality and the corresponding health of those in Pennsylvania and the Mid-Atlantic region, including CAC's members. CAC's programmatic activities include advocating for clean air and stringent emissions standards for power plants.

23. Plaintiff Dakota Resource Council ("DRC") is a nonprofit, grassroots community organizing group that works on conservation and family farm issues across North Dakota and promotes sustainable use of its natural resources. Formed in 1978, DRC grew out of existing organizing efforts responding to impacts from coal development, and has since focused on agriculture and food policy, and holding the oil and gas industry accountable for its externalities (pollution). DRC works with communities to organize around common goals of securing a thriving North Dakota and putting people first. Members take action to create public awareness and shape public policy to ensure safe and responsible development, to protect North Dakota's

agricultural economy, and to establish a foundation for a just transition to a diverse energy economy.

24. Plaintiff Downwinders at Risk is a nonprofit corporation organized and existing under the laws of the State of Texas, with its headquarters located in Dallas, Texas. Downwinders at Risk is a diverse grassroots citizens group dedicated to promoting environmental justice through protecting public health from air pollution and promoting good governance in North Texas.

25. Plaintiff Environmental Defense Fund ("EDF") is a 501(c)(3) non-profit environmental organization dedicated to finding practical solutions to critical environmental problems through the use of law, policy, science, and economics. EDF has offices throughout the United States, including in the District of Columbia. As a membership-based organization, EDF currently has more than 330,000 members in the United States, and members in all 50 states and the District of Columbia. These members have a strong interest in protecting human health and the environment from pollution.

26. Plaintiff Environmental Integrity Project ("EIP") is a non-profit, nonpartisan organization based in Washington, D.C. that empowers communities and protects public health and the environment by investigating polluters, holding them accountable under the law, and strengthening public policy on toxic air pollution and other environmental health issues. EIP works for more effective enforcement of environmental laws.

27. Plaintiff Environmental Law & Policy Center ("ELPC") is a Midwest-based not-for-profit public interest organization dedicated to action and advocacy for improving environmental quality—including air quality—and protecting natural resources. ELPC's

headquarters is in Chicago, Illinois, and ELPC also has offices in Washington, D.C., as well as Iowa, Ohio, and Wisconsin.

28. Plaintiff Montana Environmental Information Center ("MEIC") is a membership-based nonprofit dedicated to protecting public health and the natural environment in Montana. Founded in 1973, MEIC's purpose is to protect and restore the land, air, water, and life-sustaining climate of Montana. MEIC works with Montanans across the state in service of a clean and healthful environment for present and future generations. MEIC has worked for decades to require mercury and air toxics emission limits on power plants.

29. Plaintiff Natural Resources Defense Council ("NRDC") is a national non-profit environmental membership organization with hundreds of thousands of members nationwide. NRDC's purpose is to safeguard the Earth its people, its plants and animals, and the natural systems on which all life depends. Part of NRDC's core mission is to improve air quality and safeguard public health by combatting air pollution from power plants.

30. Plaintiff Sierra Club is a nonprofit corporation with its headquarters located in Oakland, California. The Sierra Club is a national membership organization whose mission is to explore, enjoy, and protect the planet; to practice and promote the responsible use of the earth's ecosystems and resources; to educate and enlist humanity to protect and restore the quality of the natural and human environment; and to use all lawful means to carry out those objectives. As such, Sierra Club is dedicated to the protection of public health and the environment, and regularly works to achieve and strengthen policies that protect air quality. It has 64 chapters and more than 780,000 members who reside in all 50 states, the District of Columbia, and Puerto Rico.

31. Defendant Donald Trump is the President of the United States. He resides and conducts his duties in Washington, D.C. He is sued in his official capacity.

32. Defendant U.S. Environmental Protection Agency ("EPA") is a federal agency of the United States. EPA is headquartered in Washington, D.C.

33. Defendant Lee Zeldin is the Administrator of the U.S. Environmental Protection Agency. He resides and conducts his duties in Washington, D.C. He is sued in his official capacity.

LEGAL BACKGROUND

34. Clean Air Act Section 7412, 42 U.S.C. § 7412, sets forth the regulatory regime for EPA to address "hazardous air pollutants," a group of 188 air pollutants determined by Congress and EPA to be particularly harmful to human health. Mercury, arsenic, hexavalent chromium, lead, and nickel are hazardous air pollutants under 42 U.S.C. § 7412.

35. This section requires EPA to regulate the largest "stationary sources" of hazardous air pollutants by promulgating pollution standards that "require the maximum degree of reduction in emissions of the hazardous air pollutants . . . (including a prohibition on such emissions where achievable) that the Administrator, taking into consideration the cost of achieving such emission reduction, and any non-air quality health and environmental impacts and energy requirements, determines is achievable." 42 U.S.C. § 7412(d)(2).

36. For new sources, the statute provides that the standards adopted "shall not be less stringent than the emission control that is achieved in practice by the best controlled similar source." 42 U.S.C. § 7412(d)(3)(A).

37. For existing sources, the statute provides that the standards adopted "shall not be less stringent, and may be more stringent than, the average emission limitation achieved by the

best performing 12 percent of the existing sources" where there are at least 30 or more sources. 42 U.S.C. § 7412(d)(3)(A)-(B).

38. For "electric utility steam generating units" *i.e.*, combustion units at fossil-fuel fired power plants—the EPA Administrator is directed to perform a study of the hazards to public health reasonably anticipated to occur as a result of emissions from such units and the statute provides EPA "shall" regulate those units under Section 7412 if the Administrator determines such regulation is appropriate and necessary after considering the results of the hazard study. 42 U.S.C. § 7412(n)(1)(A). EPA first made the determination that regulation of electric utility steam generating units under Section 7412 is necessary and appropriate in 2000. EPA made that determination again in 2024.

39. When EPA first adopts standards, Section 7412(d) provides a minimum level of stringency for those standards based on the best performing sources, known as the "maximum achievable control technology" or "MACT" "floor."

40. After these pollution standards are adopted, the Clean Air Act requires EPA to "review, and revise" those standards every 8 years "as necessary (taking into account developments in practices, processes, and control technologies)." 42 U.S.C. § 7412(d)(6). This process is known as the "technology review" and ensures that standards are modernized as necessary to reflect developments in pollution control technologies and otherwise to comply with the Clean Air Act.

41. When EPA revises standards pursuant to Section 7412(d)(6), a court has held EPA must consider the same statutory criteria set out in Section 7412(d)(2) that guide the initial standard-setting—including cost and achievability. *See Ass'n of Battery Recyclers v. EPA*, 716 F.3d 667, 673-74 (D.C. Cir. 2013).

42. A court has held that EPA is not required to re-calculate the MACT floors when revising standards pursuant to Section 7412(d)(6). *Id.* at 673. A court has held that when revising standards, EPA generally must consider statutorily required factors including cost and achievability.

43. Congress provided for a strict schedule of compliance with Section 7412 standards. Emission standards "shall be effective upon promulgation." 42 U.S.C. § 7412(d)(2). "New sources," those for which construction or reconstruction "is commenced after the Administrator first proposes regulations under this section establishing an emission standard applicable to such source," *id.* § 7412(a)(4), must comply no later than the effective date of that standard, *id.* § 7412(i)(3)(A). "Existing sources," those that are not "new," *id.* § 7412(a)(10), must comply no later than three years after the effective date, *id.* § 7412(i)(2). EPA may grant a source up to one additional year to comply where "such additional period is necessary for the installation of controls." *Id.* § 7412(i)(3).

44. The Clean Air Act authorizes the President, in narrowly prescribed circumstances, to provide compliance exemptions to stationary sources from Section 7412 hazardous air pollutant standards. It provides: "The President may exempt any stationary source from compliance with any standard or limitation under this section for a period of not more than 2 years if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so. An exemption under this paragraph may be extended for 1 or more additional periods, each period not to exceed 2 years. The President shall report to Congress with respect to each exemption (or extension thereof) made under this paragraph." 42 U.S.C. § 7412(i)(4).

45. The exemption provision only authorizes exemptions from a standard or limitation established under Section 7412.

46. D.C. Circuit case law generally allows for review of presidential actions to ensure conformity with statutory requirements, provided that "the authorizing statute or another statute places discernible limits on the President's discretion." *Mountain States Legal Found. v. Bush*, 306 F.3d 1132, 1136 (D.C. Cir. 2002). The statutory provision here at issue, Section 7412(i)(4) provides discernible limits on the President's discretion, requiring a determination that "technology to implement" a standard "is not available" and that the exemption "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4).

47. The Clean Air Act sets out requirements for rulemaking that apply to "the promulgation or revision of any emission standard or limitations under section 7412(d)." 42 U.S.C. § 7607(d)(1)(C). These requirements include establishing a rulemaking docket, publishing in the Federal Register a notice of proposed rulemaking, publicly providing factual data and other information on which the proposed rule is based, allowing submission of written comments, and providing an opportunity for a hearing, among others. *Id.* § 7607(d)(2)-(6), (h).

48. The Clean Air Act provides EPA limited authority to stay rules that have taken effect. EPA may stay such rules only when it has commenced formal reconsideration proceedings described in 42 U.S.C. § 7607(d)(7)(B). Those proceedings differ from an agency voluntarily revisiting a promulgated rule as EPA is doing in its proposed rule to rescind portions of the 2024 Rule. A rule remains in effect during a reconsideration proceeding unless it is stayed. A stay may not exceed three months. 42 U.S.C. § 7607(d)(7)(B). EPA has not convened a Section 7607(d)(7)(B) reconsideration proceeding for the 2024 Rule and has not sought to stay the

ED_021114D_00001846-00016

effectiveness of the 2024 Rule. Section 7607(d)(7)(B) is the sole authority EPA has to stay a rule after its effective date has passed. *See Clean Air Council v. Pruitt*, 862 F.3d 1, 9 (D.C. Cir. 2017).

49. As part of EPA's duties and authorities implementing the Clean Air Act Title V operating permit program, EPA has the statutory obligation to object to a permitting authority's issuance of a Title V operating permit that is not in accordance with law and to require the permitting authority to revise the permit. *See* 42 U.S.C. § 7661d(b); 40 C.F.R. § 70.8(c). If EPA does not object to such issuance, any person may petition EPA to make an objection. *See* 42 U.S.C. § 7661d(b)(2); 40 C.F.R. § 70.8(d). Any denial by EPA of such petition can be challenged in the relevant U.S. Court of Appeals under 42 U.S.C. § 7607 of the Clean Air Act. 42 U.S.C. § 7661d(b)(2).

50. EPA also has authority to order a permitting authority to reopen and revise a deficient Title V operating permit. *See* 42 U.S.C. § 7661d(e); 40 C.F.R. § 70.7(f), (g). If the permitting authority does not reopen and revise the permit within 90 days of receiving EPA's reopening notification, EPA may modify or revoke and reissue the permit. *See* 42 U.S.C. § 7661d(e); 40 C.F.R. § 70.7(g)(2), (5).

FACTUAL AND PROCEDURAL BACKGROUND

A. EPA's Mercury and Air Toxics Standards and the 2024 Rule

51. EPA first set standards, known as the "Mercury and Air Toxics Standards," for emissions of hazardous air pollutants from coal-fired power plants in 2012. *National Emission Standards for Hazardous Air Pollutants From Coal- and Oil-Fired Electric Utility Steam Generating Units and Standards of Performance for Fossil-Fuel-Fired Electric Utility, Industrial-Commercial- Institutional, and Small Industrial- Commercial-Institutional Steam*

Generating Units, 77 Fed. Reg. 9,304 (Feb. 16, 2012) ("2012 Mercury and Air Toxics Standards").

52. In May 2024, EPA adopted the 2024 Rule pursuant to its obligation under Section 7412(d)(6) to review "developments in practices, processes, and control technologies" and revise the 2012 Mercury and Air Toxics Standards "as necessary." 89 Fed. Reg. 38,508, 38,513.

53. EPA adopted the 2024 Rule after issuing a proposed rule and holding a public comment period. The factual record for the 2024 Rule demonstrated that the 2024 Rule would benefit public health by reducing harmful exposures to toxic pollutants threatening the safety of communities across the country.

54. Coal-fired power plants emit mercury, arsenic, nickel, and other toxic metals, as well as particulate matter. Mercury has adverse health effects including brain and spinal cord damage. Babies are particularly vulnerable to mercury. Non-mercury toxic metals, including arsenic, lead, nickel, and chromium have adverse health effects including cancer, kidney damage, decreased pulmonary function, chronic health disorders such as lung irritation, pneumonia, and damage to the central nervous system.

55. A coal-fired power plant consists of one or more electric utility steam generating units *i.e.*, individual "coal-fired units" that burn coal to generate steam that is then converted into electricity.

56. When EPA reviewed the 2012 Mercury and Air Toxics Standards, EPA found that coal-fired power plants that burn lignite coal were disproportionately emitting high levels of mercury. Lignite coal contains more mercury than other coal types and is the least efficient type of coal to burn for energy. In 2021, 16 of the top 20 mercury-emitting coal-fired units burned lignite coal. In 2021, lignite coal-fired units were responsible for 30% of all mercury emissions

ED_021114D_00001846-00018

from coal-fired units but only 7% of total energy generated by coal-fired units. 89 Fed. Reg. at 38,537.

57. The 2024 Rule revised the 2012 Mercury and Air Toxics Standards to further restrict pollution from coal-fired power plants. The 2024 Rule set forth four standards and requirements relevant here (hereinafter referred to as the "four requirements of the 2024 Rule"):

a. *Modernized lignite mercury standard:* First, EPA lowered limits on mercury emissions from power plants burning lignite coal to require them to meet the more protective standard that already applies to power plants burning all other types of coal. EPA lowered the mercury limit from 4 lb/TBtu[2] to 1.2 lb/TBtu.

b. *Modernized arsenic, nickel, and other metals standard:* Second, EPA lowered limits for arsenic, nickel, and other toxic metals from all coal-fired power plants from 0.030 lb/MMBtu[3] fPM to 0.010 lb/MMBtu fPM. EPA uses filterable particulate matter (fPM) as a surrogate for toxic metals.

c. *Modernized continuous emissions monitoring systems requirement:* Third, EPA required coal-fired power plants to demonstrate compliance with the arsenic, nickel, and other toxic metals standard using continuous emissions monitoring systems that provide continuous feedback and real-time information about emission levels. Under the 2012 Mercury and Air Toxics Standards, coal-fired power plants could demonstrate compliance with the standards through infrequent stack testing of emission levels only four times per year. EPA found it had authority to require continuous emissions monitoring systems under 42 U.S.C.

[2] TBtu is an abbreviation for one trillion British thermal units. British thermal unit is a traditional unit of energy.
[3] MMbtu is an abbreviation for one million British thermal units.

§ 7412(d)(6) and separately under 42 U.S.C. § 7414. EPA found authority under Section 7412(d)(6) because it "further[ed] Congress's goal [in Section 7412] to ensure that emission reductions are consistently maintained" by "provid[ing] real-time information to owners and operators (who can promptly address any problems with emissions control equipment)" and "to regulators, to adjacent communities, and to the general public." 89 Fed. Reg. at 38,535. EPA found authority under Section 7414 because it allows EPA to require applicable facilities to "install, use, and maintain such monitoring equipment" on a "one-time, periodic or continuous basis." *Id.*

d. *Strengthened startup standard:* Fourth, EPA removed an extended startup compliance option that allowed coal-fired power plants to delay compliance with numerical emissions limits, and instead comply only with less stringent work practice requirements, for up to four hours after units begin generating electricity. Removing the extended startup compliance option left only one startup compliance option in place, which required power plants to meet numerical emission limits more quickly. 89 Fed. Reg. at 38,551. This change had the effect of requiring all coal-fired power plants to meet a stricter startup standard and would therefore lower hazardous pollutant emissions. *Id.*

58. Each of the four requirements of the 2024 Rule is independently achievable. EPA explained that "a source can abide by any one of these individual requirements without abiding by any others. Thus, the EPA's overall approach to this source category continues to be fully implementable even in the absence of any one or more of the elements included in this final rule." 89 Fed. Reg. at 38,519.

59. The 2024 Rule went into effect on July 8, 2024. Regulated power plants were required to comply with the strengthened startup standard by January 2, 2025. 89 Fed. Reg. at 38,519, 38,564. Regulated power plants are required to comply with the modernized lignite mercury standard, arsenic, nickel, and other metals standard, and continuous emissions monitoring requirement by three years after the effective date (the maximum allowed by statute) on July 6, 2027. *Id.* at 38,564 (see regulatory text).

60. On information and belief, no coal-fired power plant has requested a compliance extension of up to one additional year available under 42 U.S.C. § 7412(i)(3) "if such additional period is necessary for the installation of controls."

61. EPA projected that the 2024 Rule would reduce annual emissions of mercury by 900 to 1,000 pounds starting in 2028. EPA projected that the 2024 Rule would reduce emissions of arsenic, nickel, and other toxic metals by about four to seven tons per year. 89 Fed. Reg. at 38,561. From 2028-2037, the 2024 Rule was expected to reduce 9,500 pounds of mercury and 49 tons of arsenic, nickel, and other toxic metals. The 2024 Rule is expected to yield $79 million in monetizable health benefits in 2028 alone, even without considering the benefits from reductions of mercury and toxic metals that EPA was unable to quantify.

62. EPA also projected that requiring the use of continuous emissions monitoring systems would deliver non-monetizable benefits such as increased transparency, compliance assurance, and faster identification of pollution exceedances allowing operators to act more quickly to address problems and come back into compliance with standards.

B. The Availability of Technology to Implement the 2024 Rule's Modernized Standards

63. Technology to implement the four requirements of the 2024 Rule is available.

ED_021114D_00001846-00021

64. The pollution control technologies sufficient to meet the lower emissions standards consist of technologies such as fabric filters and electrostatic precipitators to meet the standard for arsenic, nickel, and other toxic metals, and activated carbon injection systems to meet the mercury standard. Those pollution control technologies are and have been widely used by many coal-fired electric generating units.

65. Different power plants may apply different configurations and combinations of control technologies and operational methods in order to comply with emission standards.

66. EPA determined that the four requirements of the 2024 Rule are achievable for at least two reasons. First, EPA determined they are achievable because coal-fired power plants were demonstrating the ability to meet the requirements eventually adopted by the 2024 Rule based on their emissions performance to comply with the 2012 Mercury and Air Toxics Standards. Second, EPA determined they are achievable because the compliance costs were reasonable. For requirements to be achievable, the technology to implement the requirements must be available.

67. The technology needed for lignite-fired coal power plants to implement the lignite mercury standard, which may include activated carbon injection, fuel additives, scrubber chemicals, and equipment such as blowers, carbon metering valves, and sorbent storage vessels, is available.

68. The 2012 Mercury and Air Toxics Standards carved out lignite-fired coal power plants for a higher mercury emissions limit than all other coal-fired power plants. In the 2024 Rule, EPA determined that these 22 lignite-fired coal units could meet the same mercury limit as the rest of the fleet because the mercury control technologies they were already using to meet existing standards are "dial up" operational methods, allowing the operator to dial the controls

"up or down to achieve a desired [mercury] emission rate." 89 Fed. Reg. at 38,540. Two lignite units—Twin Oaks units 1 and 2 located in Texas—were already voluntarily emitting at low levels (1.24 lb/TBtu and 1.31 lb/TBtu) near the new limit adopted by the 2024 Rule (1.2 lb/TBtu). *Id.* at 38,539.

69. EPA acknowledged that the chemical composition of lignite coal, including low halogen content and high sulfur content, created certain challenges for controlling mercury emissions. However, EPA determined that these compositional challenges were not unique and other non-lignite plants had demonstrated the ability to address these issues and meet the lower mercury limit that lignite plants would now be subject to. 89 Fed. Reg. at 38,546-47, 38,549. EPA found that the advanced sorbents and chemical additives used to control mercury emissions at lignite-fired plants were "commercially available" from several vendors. *Id.* at 38,539, 38,541.

70. EPA stated that lignite coal plants have never been required to meet a lower mercury emission level and therefore had no incentive to incur the greater operating costs required to "dial up" their controls. EPA concluded: "Most units that are permitted to meet a [mercury] emission standard of 4.0 lb/TBtu have no reason to 'over control' since doing so by injecting more sorbent would increase their operating costs. So, it is unsurprising that many units that are permitted to fire lignite have reported [mercury] emission rates between 3.0 and 4.0." 89 Fed. Reg. 38,540.

71. The technology for coal-fired power plants to implement the arsenic, nickel, and other metals standard, which may include electrostatic precipitators, fabric filters, and operations and maintenance changes, is available.

72. Coal-fired power plants providing 93% of the total energy capacity generated by the coal power plant fleet have already met the standard for arsenic, nickel, and other metals adopted by the 2024 Rule with their existing technology. 89 Fed. Reg. at 38,522, 38,530.

73. The fact that the overwhelming majority of coal-fired power plants are already meeting the arsenic, nickel, and other metals standard demonstrates that the technology needed to meet the standard is available.

74. After EPA found that most power plants were emitting well below the standard adopted in the 2012 Mercury and Air Toxics Standards, the agency determined that it was necessary to update the arsenic, nickel, and other metals standard to require that the worst-performing units in the fleet achieve emissions levels in line with what the vast majority of other units were proving to be achievable due to developments in control technologies following the 2012 standards. This was consistent with Section 7412(d)'s mandate that standards reflect the maximum degree of reduction in emissions that is achievable. 89 Fed. Reg. at 38,522, 38,530.

75. EPA estimated that very few power plants would require upgrades to comply with the new lower limit on arsenic, nickel, and other metals. Only 33 of 296 coal-fired units would need to take action to meet the arsenic, nickel, and other metals standard. 89 Fed. Reg. at 38,530. EPA, *Presentation: Final National Emission Standards for Hazardous Air Pollutants: Coal and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review,* at 12 (Apr. 25, 2024), https://www.epa.gov/system/files/documents/2024-04/presentation_mats_final-2024-4-24-2024.pdf (attached as Exhibit 3). Of these 33 units, EPA estimated that 20 units would require no new capital investments but only modifications to their existing technology. 89 Fed. Reg. at 38,522, 38,530.

ED_021114D_00001846-00024

76. Continuous emissions monitoring technology needed to implement the continuous emissions monitoring requirement is available.

77. One-third of the coal-fired fleet over 100 units has already installed the required continuous emissions monitoring systems. 89 Fed. Reg. at 38,535.

78. EPA found in the 2024 Rule that technology to implement continuous emissions monitoring for compliance demonstration was "readily available and in widespread use by the electric utility industry." *Id.* at 38,536.

79. Technology sufficient to implement the strengthened startup standard is also available.

80. Technology and practices sufficient to implement the strengthened startup standard includes "greater clean fuel capacity, better tuned equipment, better trained staff, a more efficient/better design structure, or a combination of factors." *Id.* at 38,551.

81. As of the promulgation of the 2024 Rule, the overwhelming majority of coal-fired power plants—generating over 98% of energy generated by the entire coal-fired power plant fleet were already meeting the more stringent startup compliance option available under the 2012 Mercury and Air Toxics Standards. *Id.*

82. Only eight coal-fired units were using the more lax extended startup standard that the 2024 Rule removed. These units are Prairie State Generating (Units 1 and 2) (Illinois), Brame Energy Center (Units 2, 3-1, and 3-2) (Louisiana), Sherburne (Unit 3) (Minnesota), Westwood (Unit 1) (Pennsylvania), and Centralia (BW22) (Washington). 88 Fed. Reg. 24,854-85. These units were required to comply with the strengthened startup standard starting on January 2, 2025. All other coal-fired units had already been using the strengthened startup standard even prior to the 2024 Rule.

83. The fact that all other coal-fired power plants have already implemented the 2024 Rule's startup standard demonstrates that the technology to meet the strengthened startup standard is available.

84. The costs are reasonable for operators to obtain or maintain the control technologies needed to comply with the 2024 Rule.

85. For the lignite mercury standard, EPA determined that the improved operational methods needed injecting more activated carbon sorbent represented just "a small fraction of" the revenues of the affected lignite-fired coal units. 89 Fed. Reg. at 38,549.

86. The annual costs to meet the arsenic, nickel, and other metals standard are a small fraction of power sector expenditures and a very small share of total power sector sales. 89 Fed. Reg. at 38,533. EPA determined these costs were "much lower" than estimated in the original 2012 Mercury and Air Toxics Standards. *Id.* at 38,531. Only 33 of 296 coal-fired units would need to make upgrades or install new technology to comply with the modernized arsenic, nickel, and other metals standard. Twenty of those 33 units would incur costs of at most $100,000 a year per coal-fired unit. Those implementation costs are a small fraction of the power sector's annual electricity revenues, which in 2022 were $427.8 billion. *Id.* at 38,532-34.

87. Implementing the continuous emissions monitoring systems requirement costs about $72,000 per year per coal-fired unit. That is about $12,000 greater per year than the cost of quarterly emissions performance tests allowed under the 2012 Mercury and Air Toxics Standards. *See* 89 Fed. Reg. at 38,535-36.

88. Implementing the strengthened startup standard would require little to no additional expenditures by coal-fired units. The strengthened startup standard has simplified

reporting and recordkeeping requirements, which can decrease compliance costs. 89 Fed. Reg. at 38,551.

89. EPA studied the impacts of the 2024 Rule and determined its implementation would not cause any coal-fired power plant to retire, would have no significant impact on retail electricity prices, and would not cause any significant challenges to existing resource adequacy—that is, the power system's ability to meet electricity demand. 89 Fed. Reg. at 38,526, 38,556.

90. Units that must achieve additional pollution reductions to comply with the four requirements of the 2024 Rule are forecast to produce just 2% of electricity generated in 2028. 89 Fed Reg. at 38,555.

91. As EPA noted, concerns about the reliability of the power grid were raised in connection with the 2012 Mercury and Air Toxics Standards. The 2012 Mercury and Air Toxics Standards required far greater action and investments by the coal-fired power plant fleet to implement than the 2024 Rule. To date there is no evidence that the 2012 Mercury and Air Toxics Standards contributed to problems with the U.S. power grid's ability to meet energy demand. 89 Fed. Reg. at 38,527.

C. Litigation Challenging the 2024 Rule and Coal Industry Requests to Stay the Rule

92. A number of coal industry participants filed petitions for review of the 2024 Rule in the U.S. Court of Appeals for the District of Columbia Circuit. Coal industry Petitioners and associated Petitioner-Intervenors also filed emergency applications to stay the 2024 Rule premised on claims of irreparable injury should they be required to comply with the rule or take actions to prepare for compliance with the rule before the litigation in the case resolved and the potential for disruptions to the U.S. power grid should power plants be forced to shut down. The

ED_021114D_00001846-00027

D.C. Circuit denied the motions to stay the rule. Order in *North Dakota v. EPA*, No. 24-1119 (D.C. Cir., Aug. 6, 2024) (attached as Exhibit 4).

93. Petitioners and Petitioner-Intervenors then filed stay applications in the Supreme Court raising similar arguments that they would suffer irreparable injury from the costs of actions taken to prepare for rule compliance during the pendency of litigation. The Court denied those applications. Docket Order in *North Dakota v. EPA*, No. 24A180 (D.C. Cir., Oct. 4, 2024) (attached as Exhibit 5).

94. The case was fully briefed on the merits when the D.C. Circuit granted EPA's request that the case be held in abeyance pending the agency's reconsideration of the 2024 Rule. Order in *North Dakota v. EPA*, No. 24-1119 (D.C. Cir., Feb. 20, 2025) (attached as Exhibit 6). No party challenged the 2024 Rule's strengthened startup standard, nor EPA's assertion of 42 U.S.C. § 7414(a)(1)(C) as additional authority to require continuous emissions monitoring systems to demonstrate compliance with the arsenic, nickel, and other metals standard.

D. The Trump Administration's Announcement That It Was Reconsidering the 2024 Rule and Invitation to Apply for Presidential Exemptions

95. On March 12, 2025, EPA announced that it would "reconsider" the 2024 Rule—together with 31 other federal regulations protecting human health and the environment. EPA, News Release, *Trump EPA to Reconsider Biden-Harris MATS Regulation That Targeted Coal-Fired Power Plants to be Shut Down* (Mar. 12, 2025), https://www.epa.gov/newsreleases/trump-epa-reconsider-biden-harris-mats-regulation-targeted-coal-fired-power-plants-be. EPA Administrator Lee Zeldin called it "the greatest day of deregulation our nation has seen." EPA, News Release, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://www.epa.gov/newsreleases/epa-launches-biggest-deregulatory-action-us-history.

96. EPA announced on that day that: "The Trump Administration is considering a 2-year compliance exemption via Section [7412](i)(4) of the Clean Air Act for affected power plants while EPA goes through the rulemaking process." *Id.*

97. EPA published a "fact sheet" on the reconsideration of the 2024 Rule that stated that: "Any source interested in a Presidential exemption, should provide their recommendations to EPA by March 31, 2025. Sources need only provide why technology is unavailable and why it is in the national security interests of the United States to provide the exemption." EPA, *Mercury and Air Toxics Standards (MATS): Powering the Great American Comeback Fact Sheet* (undated), at https://www.epa.gov/system/files/documents/2025-03/fact-sheet-reconsideration-of-mercury-and-air-toxics-standards.pdf.

98. The fact sheet provided reasons for the reconsideration of the 2024 Rule none of which were that the technology needed for power plants to comply with the rule was not available. Instead, the fact sheet cited reasons relating to a changed interpretation of Clean Air Act authority, costs to power plants and operators, and a concern the 2024 Rule created an "undue burden" on certain coal plants. *Id.*

99. That same day, EPA announced reconsideration of eight other Section 7412 rules limiting hazardous air pollution from various industrial sectors including integrated iron and steel manufacturing, rubber tire manufacturing, synthetic organic chemical manufacturing industry, commercial sterilizers for medical devices and spices, lime manufacturing, coke ovens, copper smelting, and taconite ore processing. EPA stated that the Trump Administration was also considering 2-year compliance exemptions for facilities subject to these standards "while EPA goes through the rulemaking process" and invited sources to "provide their recommendations to EPA by March 31, 2025" to procure an exemption. *See* EPA, Trump EPA Announces

Reconsideration of Air Rules Regulating American Energy, Manufacturing, Chemical Sectors (NESHAPs) (Mar. 12, 2025), https://www.epa.gov/newsreleases/trump-epa-announces-reconsideration-air-rules-regulating-american-energy-manufacturing; EPA, National Emission Standards for Hazardous Air Pollutants (NESHAP), Powering the Great American Comeback Fact Sheet, https://www.epa.gov/system/files/documents/2025-03/neshap_powering-the-great-american-comeback_fact-sheet_2.pdf.

100. On or about March 24, 2025, EPA posted a new webpage with details on how facilities could submit requests for presidential exemptions from compliance with the nine Section 7412 rules including the 2024 Rule previously identified as being reconsidered. EPA, *Clean Air Section 112 Presidential Exemption Information* (last updated Apr. 14, 2025), https://www.epa.gov/stationary-sources-air-pollution/clean-air-act-section-112-presidential-exemption-information. (attached as Exhibit 7). The webpage explained, "EPA set up an electronic mailbox to allow the regulated community to request a Presidential Exemption under section [7412](i)(4)" and provided requesters an email address—airaction@epa.gov—to submit requests "by March 31, 2025." *Id.* EPA has since removed much of the information in an April 14, 2025 update to the webpage. EPA did not ask for any information from the general public or affected communities or otherwise invite their input on issuing exemptions.

101. On information and belief, a presidential administration has only once previously established a process for the consideration of whether the President might provide exemptions from a national emissions standard for hazardous air pollutants, for facilities that sterilize medical products. The process for consideration of and granting such exemptions was set forth in a presidential memorandum. *Memorandum on the Orderly Implementation of the Air Toxics Standards for Ethylene Oxide Commercial Sterilizers*, 90 Fed. Reg. 6,773 (Jan. 17, 2025)

("Sterilizers Memorandum"). On information and belief, no exemptions were granted as a result of this process.

102. The President stated in the Sterilizers Memorandum that the exemption process was intended to address "the exceptional circumstances in which a commercial sterilizer can demonstrate that, notwithstanding due diligence and best efforts, it will be unable to meet a covered standard or limitation required by the [ ] Rule before the compliance deadline due to the unavailability of control technology for the facility, leading to likely shutdown of the facility, and the best available information demonstrates that the shutdown of the facility will likely lead to a serious disruption to the supply of medical products, such as medical devices and pharmaceuticals, necessary for America's national security and public health." 90 Fed. Reg. at 6,774.

103. The President made clear in the Sterilizers Memorandum that issuing an exemption is a last resort reserved for when "notwithstanding its due diligence and best efforts, the facility cannot be brought into compliance before the compliance deadline for the covered standard or limitation." *Id.*

E. President Trump Granted Exemptions from the 2024 Rule to 68 Coal-Fired Power Plants.

Release and Publication of the Exemption Proclamation and Annex 1

104. On April 8, 2025, President Trump issued a proclamation (the Exemption Proclamation) that exempted "certain stationary sources . . . as identified in Annex 1 of this proclamation" from the 2024 Rule pursuant to "authority vested . . . by the Constitution and the laws of the United States of America, including section [7412](i)(4) of the Clean Air Act, 42 U.S.C 7412(i)(4)." Exemption Proclamation.

105. In support of the exemptions, the Exemption Proclamation included what it referred to as two "determinations." *Id.*

106. First, the Exemption Proclamation purported to "determine" that "[t]he technology to implement the Rule is not available." *Id.* The Proclamation stated: that "[s]uch technology does not exist in a commercially viable form sufficient to allow implementation of and compliance with the Rule by its compliance date of July 8, 2027." *Id.*

107. Second, the Exemption Proclamation purported to "determine" that "[i]t is in the national security interests of the United States to issue this Exemption" because the 2024 Rule "places severe burdens on coal-fired power plants" and the "viability of our Nation's coal sector," "requires compliance with standards premised on the application of emissions-control technologies that do not yet exist in a commercially viable form," and provides a "compliance timeline . . . [that] therefore raises the unacceptable risk of the shutdown of many coal-fired power plants, eliminating thousands of jobs, placing our electrical grid at risk, and threatening broader harmful economic and energy security effects . . . in turn undermin[ing] our national security, as these effects would leave America vulnerable to electricity demand shortages, increased dependence on foreign energy sources, and potential disruptions of our electricity and energy supplies, particularly in times of crisis." *Id.*

108. The Exemption Proclamation declared that the exempted power plants "are exempt from compliance with the Rule for a period of 2 years beyond the Rule's compliance date—*i.e.*, for the period beginning July 8, 2027, and concluding July 8, 2029 (Exemption)." *Id.*

109. The Exemption Proclamation asserts the compliance deadline of the 2024 Rule is July 8, 2027. That is wrong. The compliance deadline for the lignite mercury standard, the nickel, arsenic, and other metals standard, and the continuous emissions monitoring systems

requirement is July 6, 2027. The compliance deadline for the 2024 Rule's startup standard was January 2, 2025. 89 Fed. Reg. at 38,564.

110. The Exemption Proclamation purports to exempt sources from compliance with the 2024 Rule for a period that extends beyond two years from the date of the purported "determination" on technological availability and national security.

111. The Exemption Proclamation stated that, "during this 2-year period [from July 8, 2027, to July 8, 2029], these stationary sources are subject to the compliance obligations that they are currently subject to under the [2012 Mercury and Air Toxics Standards] as [they] existed prior to the [2024] Rule." *Id.*

112. President Trump transmitted a notification of the exemptions to Congress, dated April 14, 2025. H.R. Doc. No. 119-40, (2025). The Exemption Proclamation and "Annex 1" were published in the Federal Register on April 21, 2025. 90 Fed. Reg. 16,777 (Apr. 21, 2025), www.govinfo.gov/content/pkg/FR-2025-04-21/pdf/2025-06936.pdf.

113. Plaintiff EDF submitted a Freedom of Information Act request to EPA seeking information about requests for exemptions from sources and their responses. To date, EDF has not received any responsive documents.

114. The White House has since highlighted the exemptions as an example of the President broadly "pausing restrictive emissions rules for coal plants." *See, e.g.*, White House, On Earth Day, We Finally Have a President Who Follows the Science (Apr. 22, 2025), https://www.whitehouse.gov/articles/2025/04/on-earth-day-we-finally-have-a-president-who-follows-science. The same White House release stated that "President Trump is cutting wasteful regulations that stifle innovation and raise costs. Actions like pausing restrictive emissions rules for coal plants . . . have accelerated responsible energy and infrastructure projects while

maintaining rigorous environmental standards saving American families thousands annually on energy bills and proving that a strong economy and a healthy environment go hand-in-hand." *Id.*

EPA's Proposed Repeal

115. On June 11, 2025, Administrator Zeldin signed and submitted to the Office of the Federal Register for publication a notice of proposed rulemaking entitled, "Repeal of Amendments to National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units," *available at* https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards. The notice proposes to repeal the modernized mercury standard, the modernized arsenic, nickel, and other metals standard, and the continuous emissions monitoring standard.

Facts Relating to Power Plants That Received Exemptions

116. Although the Exemption Proclamation issued on April 8, 2025 referenced an "Annex I" for the list of exempted power plants, the Proclamation as issued did not include an "Annex I." Plaintiff EDF filed a Freedom of Information Act request with EPA and the White House Office of Management and Budget for "Annex I" on April 10. The "Annex I" list of exempted power plants was published for the first time on April 14, when EPA posted the document to its website. EPA, "Annex 1"[4] (Apr. 14, 2025) https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf (providing list of 68 exempted plants organized by operating company).

[4] While the Exemptions Proclamation referred to an "Annex I" using the Roman numeral, the document itself as posted on EPA's website and later in the Federal Register was titled "Annex 1" using the Arabic numeral.

117. The list revealed that the President had exempted 68 coal-fired power plants across 23 states from the 2024 Rule. The exemptions cover approximately one-third of the entire domestic coal fleet.

118. Annex 1 lists 47 power companies and identifies every "affected facility/source" owned by that power company granted an exemption. The document in some cases identifies specific coal-fired units located at a specified facility receiving exemptions, but in other cases only lists the facility itself. The total number of exempted coal-fired units is thus unspecified and unclear.

119. Some of the power plants that the Exemption Proclamation exempts are already able to meet the four requirements of the 2024 Rule with their existing controls. EPA determined that these power plants do not need to install or upgrade any technology or make any changes to operations and maintenance to implement the 2024 Rule's standards. For example, the H.L. Spurlock (Kentucky), R.S. Nelson (Louisiana), Sioux (Missouri), and Cooper (Kentucky) plants have already installed the continuous emissions monitoring systems required by the 2024 Rule, are not affected by the lignite mercury standard because they do not burn lignite, are already meeting the modernized arsenic, nickel, and other metals standard with their existing technology, and are already meeting the strengthened startup standard.

120. All but one of the exempted power plants (the Colstrip facility in Montana) are able to meet the modernized arsenic, nickel, and other metals standard with existing controls. *See* Proposed Repeal at 23. Several other exempted power plants, including D. B. Wilson (Ohio), Milton R. Young 2 (North Dakota), Martin Lake 1 (Texas), San Miguel (Texas), Mt. Storm (West Virginia), and Laramie River 3 (Wyoming) already have the necessary control technology to meet the modernized arsenic, nickel, and other metals standard and would only need to

implement operations and maintenance changes to comply with the 2024 Rule's modernized arsenic, nickel, and other metals standard.

121. Some exempted power plants would need to upgrade their existing pollution controls with commercially available equipment to comply with the 2024 Rule's standard for arsenic, nickel, and other metals. Colstrip (Montana), Labadie (Missouri), and Harrison (West Virginia) need to invest in fabric filters or electrostatic precipitators to meet the modernized arsenic, nickel, and other metals standard. John B. Rich (Pennsylvania) and Westwood (Pennsylvania) need a bag-type upgrade to their existing fabric filters to meet the modernized arsenic, nickel, and other metals standard.

122. Only 10 of the coal plants exempted by the Exemption Proclamation are lignite-fired: Antelope Valley (ND), Coal Creek (ND), Coyote (ND), Leland Olds (ND), Limestone (TX), Martin Lake (TX), Milton R. Young (ND), Oak Grove (TX), Red Hills Generating Facility (MS), and San Miguel (TX). All 10 of the lignite-fired coal plants exempted by the Exemption Proclamation are already using some form of sorbent or activated carbon injection system to control emissions. Those 10 facilities have thus installed the technology necessary to meet the 2024 Rule's modernized mercury standard and would only need to change some aspects of the operation of that technology to further control mercury emissions sufficient to meet the 2024 Rule's modernized mercury standard. 89 Fed. Reg. at 38,547-49.

123. At least 42 of the 68 coal-fired plants exempted by the Exemption Proclamation are already using fabric filters and electrostatic precipitators and have been meeting, on average, the levels of the arsenic, nickel, and other metals standard of the 2024 Rule.

124. Eleven of the 68 coal-fired power plants exempted by the Exemption Proclamation already have continuous emissions monitoring systems installed.

ED_021114D_00001846-00036

125. Two of the coal-fired power plants exempted by the Exemption Proclamation were previously using the extended startup compliance option and have been required to use the strengthened startup standard in the 2024 Rule beginning in January 2025. These plants are Rausch Creek Generation/Westwood (Pennsylvania) and Brame Energy Center (Unit 2) (Louisiana). All other exempted power plants were already using the strengthened startup standard to comply.

Lack of Source-Specific Determinations Made by the President

126. The Exemption Proclamation does not reveal any factual consideration or deliberation of the statutory prerequisites for granting a Section 7412(i)(4) exemption. Readily discernible facts reveal that the statutory prerequisites are not met.

127. The President has not, in the Exemption Proclamation, Annex 1, or (on information and belief) otherwise, for any power plants granted exemptions, made a source-specific determination that "the technology to implement" each (or any) of the 2024 Rule's requirements "is not available" for that specific power plant or any of the coal-fired units at that power plant.

128. The Exemption Proclamation states without explanation, analysis, basis, or specificity that "[t]he technology to implement the Rule is not available" and "does not exist in a commercially viable form sufficient to allow implementation of and compliance with the Rule by its compliance date of July 8, 2027." This statement is not a determination that the technology to comply with each requirement is unavailable for each of the exempted power plants.

129. The Exemption Proclamation states "the technology to implement the Rule is not available." The Exemption Proclamation does not specify which technology is not available. The Exemption Proclamation does not specify for which of the four requirements of the 2024 Rule

ED_021114D_00001846-00037

the technology to implement such requirement is not available. Each of the four requirements depends on implementing distinct technologies.

130. The President has not, in the Exemption Proclamation, Annex 1, or (on information and belief) otherwise made any determination that any of the power plants listed on Annex 1 will shut down if required to comply with the 2024 Rule.

131. The President has not, in the Exemption Proclamation, Annex 1, or (on information and belief) otherwise made any determination that the retirement or shutdown of any of the plants listed on Annex 1 would pose national security risks to the United States. The Exemption Proclamation declares "[t]he current compliance timeline of the Rule therefore raises the unacceptable risk of the shutdown of many coal-fired power plants," but does not say which power plants are at risk of shutting down or assert that any of the power plants listed in Annex 1 are at "unacceptable risk of shutdown." The President has not, in the Exemption Proclamation, Annex 1, or (on information and belief) otherwise made any determination for each power plant granted an exemption (1) that the technology is not available for it to comply with the 2024 Rule, (2) that the plant will retire as a result, or (3) that such retirement would pose a national security threat.

132. The President has not, in the Exemption Proclamation, Annex 1, or (on information and belief) otherwise made any determination as to the individual exempted plants and the different requirements from which they necessitated an exemption.

133. The Exemption Proclamation exempts power plants from having to comply with the strengthened startup standard from July 8, 2027 to July 8, 2029 after they have been subject to compliance with the standard from January 2, 2025 to July 7, 2027. This illogic underscores

the absence of a fact-based determination made about the availability of technology to implement the 2024 Rule over any particular time period.

134. In the alternative, if the exemption from the strengthened startup standard were to apply immediately to power plants, it would provide an exemption for over four years, when 42 U.S.C. § 7412(i)(4) allows the President to issue a single exemption "of not more than 2 years."

135. Similarly, the Exemption Proclamation's erroneous assertion that the compliance deadline of the 2024 Rule is July 8, 2027, rather than July 6, 2027, means the terms of the proclamation may require sources to install controls and comply with the 2024 Rule's requirements for two days in July 2027 before sources are exempted. This illogic underscores the absence of a determination about the availability of technology over any particular time period.

136. The Exemption Proclamation granted Brame Energy Center Unit 2 an exemption from the 2024 Rule for the period from July 8, 2027, to July 8, 2029. Brame Energy Center Unit 2 is one of the few coal-fired units that was previously not in compliance with the 2024 Rule's startup standard. Brame Energy Center Unit 2, like all other coal-fired units subject to the 2024 Rule, was required to comply with the more stringent startup standard starting January 2, 2025. On its face, if the Exemption Proclamation exempts sources from compliance with the startup standard, it would mean that Brame Energy Center Unit 2 will be exempt from that standard from July 8, 2027, to July 8, 2029. And it would mean that Brame Energy Center Unit 2 will either need to procure and use technological controls before July 8, 2027, to comply with the strengthened startup standard—or be in noncompliance with the 2024 Rule—but then be permitted to not use such technological controls from July 8, 2027, to July 8, 2029 due to a Presidential determination that such technology is "not available" to achieve compliance during that later period. This belies an assertion that the technology to implement the startup standard is

not available and demonstrates that there was no determination made as to the availability of technology necessary for Brame Energy Center Unit 2 to implement the strengthened startup standard.

137. Similarly, the factual allegations *supra* at ¶¶ 119, 121, 122-125, that the Exemption Proclamation exempts coal-fired power plants from requirements of the 2024 Rule that they are already in compliance with demonstrates that there was no determination made about the availability of technology for exempted sources to implement the 2024 Rule.

Facts Contradicting the Exemption Proclamation

138. The facts alleged *supra* at ¶¶ 63-93 demonstrate that the technology to implement the 2024 Rule is available and that compliance with the 2024 Rule will not cause any power plant to retire.

139. The Exemption Proclamation's determination that technology is not "available" is contradicted by the fact that all of the different technologies necessary to implement the 2024 Rule, such as continuous emission monitoring systems, are already installed and in use by existing coal-fired power plants. As explained *supra* ¶¶ 119, 121, 122-125, several of the exempted power plants already have installed the technology necessary to comply with the 2024 Rule.

140. The Exemption Proclamation directly contradicts the findings made by EPA just 11 months earlier, on the basis of an ample administrative record developed through public notice and comment, that the control technologies needed to implement each of the four requirements of the 2024 Rule are available and cost reasonable, and that each of the four requirements of the 2024 Rule are achievable. *See, e.g.*, 89 Fed. Reg. at 38,533, 38,535-36, 38,539.

141. EPA found that the 2024 Rule will not drive any coal plant retirements, and that the 2024 Rule can be implemented without interfering with electric system reliability or resource adequacy. The Exemption Proclamation directly contradicts those findings, made just 11 months earlier.

142. Since the time the 2024 Rule was finalized, upon information and belief, no unit has publicly indicated that it intends to shut down as a result of the 2024 Rule.

143. Since President Trump issued the Exemption Proclamation, certain power plant owners and operators who did not receive an exemption have publicly shared that they did not request an exemption. One power plant operator stated: "The 2024 MATS rule does not impact our ability to continue to provide safe, reliable and affordable energy to our customers while continuing to comply with environmental regulations." Morgan Watkins, *Why two Kentucky utilities sought coal pollution exemption from Trump, but others didn't*, Louisville Public Media (Apr. 29, 2025), https://www.lpm.org/investigate/2025-04-29/why-two-kentucky-utilities-sought-coal-pollution-exemption-from-trump-but-others-didnt. Another power plant operator said: "After careful consideration of the statutory requirements necessary to seek a presidential exemption, Duke Energy determined that it was in the best interest of our customers not to seek an (exemption)." *Id.* The fact that certain power plant owners and operators did not request an exemption illustrates how technology is available to implement the 2024 Rule's requirements.

STANDING

144. Plaintiffs' members live, work, and recreate in areas affected by the excess pollution that is and will be emitted from the exempted coal-fired power plants. Members are harmed by breathing in air pollution from the exempted plants. Members are concerned that exposure to pollution from the exempted plants could have harmful impacts on their health.

Exposure to mercury, particulate matter, and arsenic, nickel, and other heavy metals emitted at higher volumes by exempted plants as a result of the Exemption Proclamation has adverse health effects, which may include cancer, kidney damage, and detrimental effects to the central nervous system.[5]

145. Plaintiffs' members are also harmed by exposure to excess mercury when consuming fish contaminated with power plant mercury. Coal plant mercury emissions can travel through the air before being deposited on land or in waterbodies. Once deposited into waterbodies, microbial action can turn mercury into methylmercury. Methylmercury can be taken up by aquatic organisms and bioaccumulate in larger, longer-living organisms that eat smaller organisms. Humans are exposed when they eat fish with high concentrations of methylmercury. Exposure to methylmercury from fish consumption causes adverse health effects, including neurodevelopmental and cardiovascular harms. 89 Fed. Reg. at 38,515. Birds and mammals can also become exposed via fish consumption and face resulting adverse health effects.

146. Plaintiffs' members are concerned that air pollution from the exempted power plants is present in the locations where they live, work, and recreate. These reasonable concerns about their increased exposure to air pollution while engaged in those activities and other resulting harms from that exposure diminish their enjoyment of outdoor activities and areas they previously enjoyed or would like to continue to engage in or use, thereby harming members'

---

[5] EPA, Fact Sheet: EPA's Final Rule to Strengthen and Update the Mercury and Air Toxics Standards for Power Plants at 4, https://www.epa.gov/system/files/documents/2024-04/fact-sheet_mats-rtrfinal_rule_2024.pdf; *see also National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Revocation of the 2020 Reconsideration and Affirmation of the Appropriate and Necessary Supplemental Finding*, 88 Fed. Reg. 13,956 (Mar. 6, 2023).

aesthetic and recreational interests. Some members are aware that mercury and other heavy metals can contaminate animals and are concerned about the safety of eating the fish they catch and animals they hunt in the areas affected by the exempted plants. Some members fish recreationally but curtail their fishing or refrain from fishing, or avoid eating the fish they catch, because of mercury advisories or other concerns about the mercury content of fish.

147. Plaintiffs' members benefit from stronger controls on power plants in a variety of ways, including through reduced exposure to pollution, cleaner air and environment, reduced contamination of fish and game, and a greater ability to enjoy outdoor activities in areas affected by the power plants.

148. Some of Plaintiffs' members live, work, fish, hunt, or recreate near power plants that are exempted from complying with the strengthened standard for arsenic, nickel, and other toxic metals beginning on July 8, 2027. Compliance with the strengthened standard will reduce health-harming pollution, including particulate matter and heavy metals. Exempting power plants from the strengthened standard injures those members by delaying or denying them the benefits of stronger pollution controls.

149. Some of Plaintiffs' members live, work, fish, hunt, or recreate near lignite-fired power plants that are exempted from complying with the strengthened mercury standards beginning on July 8, 2027. Compliance with the strengthened standard will reduce mercury pollution. Exempting power plants from the strengthened standard injures those members by delaying or denying them the benefits of stronger pollution controls.

150. Some of Plaintiffs' members live, work, or recreate near power plants that are exempted from the requirement to employ continuous emissions monitoring for the strengthened standard for arsenic, nickel, and other toxic metals beginning on July 8, 2027. Requiring

ED_021114D_00001846-00043

continuous emissions monitoring can result in reduced pollution and strengthened compliance through faster identification and correction of problems with pollution control devices. 89 Fed. Reg. at 38,508, 38,536. EPA recognized those benefits in its 2024 rulemaking. Continuous emissions monitoring will also generate up-to-date information for Plaintiffs, their members, and the public about particulate matter and toxic metal emissions at the power plants.

151. Exempting power plants from the requirement to employ continuous emissions monitoring injures members by delaying or denying them the pollution reduction and improved compliance that can result from continuous monitoring. The exemptions also deny Plaintiffs and their members the information about emissions at the power plants that continuous emissions monitoring would provide. Sources that are major under Clean Air Act Section 7412, 42 U.S.C. § 7412, are subject to the Clean Air Act's Title V permitting requirements. Title V requires that "a copy of each permit application, compliance plan including the schedule of compliance), emissions or compliance monitoring report, certification, and each permit . . . shall be available to the public." 42 U.S.C. § 7661b(e). Some Plaintiffs and their members would use such monitoring data to raise public awareness of air pollution and to further Plaintiffs' and their members' advocacy, education, and outreach efforts to reduce air pollution. For example, it can allow Plaintiffs and their members to better identify violations and act when the data shows a power plant has not complied with pollution standards. It would also help the communities some Plaintiffs serve make educated decisions about how they engage in advocacy to reduce air pollution. And improved monitoring data empowers Plaintiffs, their members, and the communities they work with to better understand their own pollution exposures so that they can modify their behavior to limit their exposure to pollution from coal power plants. Without continuous emissions monitoring data, Plaintiffs and their members will be unable to improve

their advocacy and public education work, and some members will be deprived of information they could have used to evaluate the pollution exposure and health risks of areas affected by the exempted power plants and make decisions to reduce their exposure.

152. Some of Plaintiffs' members live, work, or recreate in areas near power plants that are exempted from the requirement to comply with more stringent startup standards, for which compliance was required starting on January 2, 2025. Compliance with the strengthened standard will reduce mercury and other toxic air pollution. Exempting power plants from the strengthened standard injures those members by delaying or denying them the benefits of stronger pollution controls.

153. Power plants that were issued exemptions are now able to emit toxic air pollution at higher levels during the period of exemption than otherwise would have been allowed. They are also able to forgo use of continuous emissions monitoring during the period of exemption. Power plants that may have already been complying with the strengthened standards of the 2024 Rule will now have no legal obligation to do so during the period of exemption. They will be permitted to stop using already-installed pollution control technologies and raise their emissions, significantly increasing the risk to Plaintiffs and their members of exposure to increased emissions and the health harms associated with such exposures.

154. A coal industry group stated that the 2024 Rule will require coal power plants to take immediate actions and make immediate expenditures to be able to meet the rule's requirements by the compliance deadline.

155. Stephanie Coates is a member of the Environmental Defense Fund and works as a Climate & Health Project Manager for EDF. Ms. Coates lives in Houston with her family and enjoys spending time outdoors with her family, including biking and taking regular walks to the

park or coffee shop. She lives about 25 miles from the W.A. Parish Coal Plant. The W.A. Parish coal plant needs to install CEMS to comply with the 2024 Rule. The Martin Lake coal plant, the Oak Grove coal plant, and the San Miguel coal plant are located outside of Houston. All three plants are lignite-fired and must make operations changes to comply with the strengthened mercury standard. Martin Lake and San Miguel also need to invest in increased operations and maintenance to meet the strengthened standard for arsenic, nickel, and other metals, and San Miguel needs to install CEMS to comply with the 2024 Rule. All four of those coal plants are exempted from compliance with the 2024 Rule by the Exemption Proclamation. Ms. Coates has concerns about her exposure and her children's exposure to mercury and other toxic emissions from those exempted coal plants, and the effect of such exposures on their health. Ms. Coates was diagnosed with non-hereditary breast cancer and is concerned that toxic pollution from those exempted coal plants will exacerbate her health condition and detract from her quality of life. Ms. Coates relies on public information about air quality to make decisions about the health risks of outdoor activities, and limits the time she and her children spend outdoors when air quality is unhealthy. Exemptions for W.A. Parish and other Houston-area coal plants deny her the more detailed and regular information about coal plant emissions that would have otherwise been available under the 2024 Rule. The exemptions also harm Ms. Coates and her family by permitting exempted coal plants to emit more pollution during the period of exemption than they would otherwise emit.

156. Michelle L. Marley-Knox is a member of ELPC and has lived within thirty miles of the Kincaid power plant in Christian County, Illinois for her entire life. She enjoys outdoor recreational activities near the Kincaid plant, including bicycling, camping, water activities, and fishing. In recent years, she has needed to stop fishing and swimming in the lakes near her home

due to concerns over mercury pollution. Everyone in Ms. Marley-Knox's family suffers from a susceptibility to bronchitis and must carry inhalers. The Kincaid plant was scheduled to close down by the end of 2027 but has recently received an exemption from the 2024 Rule. It already has the technology sufficient to implement the arsenic, nickel, and other toxic metals standard of the 2024 Rule. With the exemption, the Kincaid plant will no longer be required to implement or use that technology and will be allowed to emit levels of pollution in excess of the 2024 standard beginning in July 2027. Ms. Marley-Knox is also concerned that the Kincaid plant may remain open longer than it had originally planned and continue to jeopardize her health, recreational, and business interests. Further, Ms. Marley-Knox is concerned that the Kincaid plant will no longer be required to conduct continuous monitoring and that the subsequent lack of up-to-date emissions information would prevent her from effectively evaluating the health risks she and her family are exposed to each day.

157. Derf Johnson, a lifelong resident of Montana, is a member of the Sierra Club and the Montana Environmental Information Center (MEIC), and a Deputy Director of MEIC. Mr. Johnson enjoys outdoor activities in Montana including hunting, fishing, swimming, and observing wildlife. Mr. Johnson regularly visits the area around the Colstrip coal plant and has definite plans to return to the area. Annex 1 lists the Colstrip coal plant as exempted from compliance with the 2024 Rule. Colstrip needs to install pollution controls to be able to achieve the levels in the arsenic, nickel, and other metals standard of the 2024 Rule. Visible air pollution from the Colstrip coal plant and concerns about the health implications of air pollution degrade his experience visiting southeastern Montana, where Colstrip is located. Mr. Johnson is aware that the Colstrip coal plant emits mercury and other toxic metals, as well as particulate matter. He is concerned about exposure to the coal plant's emissions and the resulting harm to his health.

158. Catherine Fleischman is a member of the Natural Resources Defense Council. She lives in Davis, West Virginia, in close proximity to the Mt. Storm Generating Station coal-fired power plant. Mt. Storm is listed in Annex 1 as exempted from the 2024 Rule. Mt. Storm already has technology sufficient to implement the modernized arsenic, nickel, and other toxic metals standard and the continuous emissions monitoring standard of the 2024 Rule. Ms. Fleischman frequently checks air quality information. She spends a significant amount of time outside in the area of the Mt. Storm plant and limits her outdoor activities when air quality is poor because she suffers fatigue and lethargy from poor air quality. She is concerned about the health effects from air quality degradation as a result of pollution from the Mt. Storm plant and frequently observes and smells plumes of pollution from Mt. Storm.

159. Barbara Sue is a member of the Natural Resources Defense Council. She lives in Macon, Georgia, near the Scherer coal-fired power plant in Monroe County, Georgia. The Scherer Plant is listed in Annex 1 as exempted from the 2024 Rule. It has technology sufficient to implement the modernized arsenic, nickel, and other toxic metals standard of the 2024 Rule. With the exemption, the Scherer Plant will no longer be required to implement or use the technology and will be allowed to emit levels of pollution in excess of the standard beginning in July 2027. Ms. Sue frequently checks air quality information. She suffers severe ongoing allergies, sinus problems, and migraines that she is concerned are exacerbated by air pollution from the Scherer plant.

160. As set forth above, Plaintiffs' members directly benefit from the public-health and environmental protections and informational benefits provided by the requirements adopted in the 2024 Rule and as a result are harmed by exempting power plants from compliance with those

ED_021114D_00001846-00048

requirements.[6] Granting the requested relief would redress these injuries. The interests Plaintiffs seek to protect by bringing this case are germane to their organizational purposes of working to secure reductions of harmful air pollutants from sources covered by the 2024 Rule. The participation of individual members is not required because the claims and entitlement to relief will be resolved without consideration of those members' individual circumstances.

CLAIMS FOR RELIEF

COUNT ONE:

Unlawful Executive Action in Violation of the Clean Air Act (Nonstatutory Review for Violations of Federal Law by Federal Officials; Against All Defendants)

161. Plaintiffs re-allege and incorporate by reference the allegations contained in all preceding paragraphs of this Complaint.

162. The Court possesses inherent equitable power to "grant injunctive relief . . . with respect to violations of federal law by federal officials." *Armstrong v. Exceptional Child Ctr., Inc.*, 575 U.S. 320, 326–27 (2015). Such authority is presumptively available "absent only 'the clearest command' otherwise in a statute, . . . either express or implied." *Mathis v. United States Parole Commission,* 749 F. Supp. 3d 8, 23 (D.D.C. 2024) (quoting *McQuiggin v. Perkins*, 569 U.S. 383, 397 (2013)). Congress has nowhere foreclosed review of the interpretation and application of 42 U.S.C. § 7412(i)(4).

163. Section 7412(i)(4) establishes a judicially manageable standard with clear and precise limits of the sort federal courts routinely construe to determine whether the officials have acted consistent with law.

[6] Plaintiffs are prepared to file their members' declarations with their principal brief or in the event their standing is challenged.

164. The Exemption Proclamation is an unlawful action that clearly exceeds the scope of the President's statutory authority and rests upon an unlimited, and plainly untenable, interpretation of the Clean Air Act and application of both. The Exemption Proclamation exceeded the authority afforded to the President by Congress in 42 U.S.C. § 7412(i)(4) in multiple respects.

165. Section 7412(i)(4) authorizes an exemption only for a "stationary source," and only if the President "determines that the technology to implement such standard is not available" for that source and determines "that it is in the national security interests of the United States" to exempt that source.

166. The President failed to make a factual determination as to "any stationary source" that a technology is not available for that "stationary source" to implement the 2024 Rule, in violation of 42 U.S.C. § 7412(i)(4) and in excess of lawful authority.

167. The President failed to make a factual determination as to "any stationary source" that an exemption for that source is in the "national security interests of the United States," in violation of 42 U.S.C. § 7412(i)(4) and in excess of lawful authority.

168. The President failed to make factual determinations as to "any stationary source" that the technology is not available *and* that an exemption is in the national security interests of the United States, in violation of 42 U.S.C. § 7412(i)(4) and in excess of lawful authority.

169. EPA and the President are bound by the Clean Air Act's duties with respect to implementing 42 U.S.C. § 7412(i)(4), following rulemaking procedures, and being bound by lawfully adopted regulations.

170. The Exemption Proclamation exceeds the President's statutory authority and is contrary to Section 7412 of the Clean Air Act because, by granting sweeping exemptions to one

ED_021114D_00001846-00050

third of regulated sources without determinations pertaining to those sources, the Proclamation effectively amends the compliance dates of EPA's 2024 Rule without observing the statutorily mandated process for amending a rule. Section 7412(i)(4) is a narrow provision applicable in exceptional circumstances; it is not intended to be used as a substitute for notice-and-comment rulemaking to amend EPA standards that were themselves adopted after a full rulemaking process and that reflected EPA determinations that technology is available and standards achievable. The failure to make the required findings here operated as a process-free, evidence-free amendment to the 2024 Rule.

171. The Exemption Proclamation unlawfully attempts to amend a rule and/or stay a rule pending reconsideration in violation of the Clean Air Act, 42 U.S.C. § 7607(b), (d).

172. The Exemption Proclamation is unlawful because it flouts the statutory purpose of Section 7412(i)(4) authority—to address circumstances where requiring compliance with a standard would prevent the operation of national security-related equipment due to the unavailability of necessary control technology and instead has an improper purpose to relieve sources of regulatory burdens and compliance costs while EPA reconsiders the 2024 Rule.

173. The Proclamation exceeds the authority granted in Section 7412(i)(4) because it seeks to exempt sources from all the 2024 Standards indiscriminately, without identifying for each source which of the four distinct standards would call for technology that is unavailable. For example, units producing over 98% of coal plant-generated electricity in 2022 already employed the 2024 Rule's startup standard, and 93% of power plants covered by the 2024 Rule are already meeting the arsenic, nickel, and other toxic metals standard. Section 7412(i)(4) authorizes the President to exempt a source from a requirement if technology is unavailable to implement that requirement. The statute does not authorize the President or EPA

to exempt sources from requirements as to which the relevant technology is available. Accordingly, there could be no basis for exempting sources from all four of the 2024 Rule's requirements, even if (contrary to fact) the conditions for exemption could be satisfied for a subset of the requirements. The effect of that unlawfully indiscriminate approach is to exempt many sources from compliance with standards that will be implemented by technologies already installed at such sources, and to exempt other sources from compliance even where the requisite technologies required by the 2024 Rule's compliance date are readily available and in widespread use at similar sources.

174. The President lacks any independent authority under the U.S. Constitution to issue the exemptions.

175. Because the Exemption Proclamation is beyond the Clean Air Act authority and *ultra vires*, EPA actions implementing or giving effect to the proclamation are similarly beyond the Clean Air Act authority and *ultra vires*.

COUNT TWO:

Unlawful Executive Action in Violation of the Clean Air Act (Nonstatutory Review for Violations of Federal Law by Federal Officials; Against All Defendants)

176. Plaintiffs re-allege and incorporate by reference the allegations contained in all preceding paragraphs of this Complaint.

177. The President granted exemptions when the technology needed to implement the 2024 Rule is in fact available, in violation of 42 U.S.C. § 7412(i)(4) and in excess of lawful authority. The relevant technologies were in widespread use by regulated sources, including at the time of the Exemption Proclamation by many of the sources listed in Annex 1.

178. The purported determinations are not supported by any factual analysis or reasoning and are unambiguously contradicted by factual evidence, including EPA's own findings and record for the 2024 Rule.

179. The absence in the Exemption Proclamation, in Annex 1, or otherwise of any findings, reasoning, or other facts to establish the necessary factual predicate that the needed technology is not available demonstrates that the President did not make the determinations required by 42 U.S.C. § 7412(i)(4). That is confirmed by the fact that many of the exempted sources had already installed the technologies in question. Rather, the Exemption Proclamation bypassed and contravened statutory requirements to achieve sweeping compliance exemptions unauthorized by any law.

180. Because the Exemption Proclamation is beyond the Clean Air Act authority and *ultra vires*, EPA actions implementing or giving effect to the proclamation are similarly beyond the Clean Air Act authority and *ultra vires*.

COUNT THREE:

Unlawful Executive Action in Violation of the Clean Air Act (Nonstatutory Review for Violations of Federal Law by Federal Officials; Against All Defendants)

181. Plaintiffs re-allege and incorporate by reference the allegations contained in all preceding paragraphs of this Complaint.

182. Section 7412(i)(4) authorizes the President to exempt a stationary source only "for a period of not more than 2 years" that begins immediately following the statutorily-required determinations. With an end date of July 8, 2029 more than four years away the Exemption Proclamation purports to grant exemptions exceeding the "period of not more than 2 years" that Congress prescribed to allow technology to become available or national security

issues to be resolved following the President's determinations, in violation of 42 U.S.C. § 7412(i)(4) and in excess of lawful authority.

183. The Exemption Proclamation is unlawful because the President has not made and cannot make a determination that the technology to implement the 2024 Rule will not be available during the future period during which the exemption applies.

184. The Exemption Proclamation is unlawful because the President has not made and cannot make a determination that it is in the national security interests of the United States to exempt sources from compliance with the 2024 Rule during the future period during which the exemption applies.

185. Because the Exemption Proclamation is beyond the Clean Air Act authority and *ultra vires*, EPA actions implementing or giving effect to the proclamation are similarly beyond the Clean Air Act authority and *ultra vires*.

COUNT FOUR:

Unauthorized Executive Action in Disregard of Section 7412(i)(4)'s Inapplicability to Provisions Independently Justified under Statutory Authority Other than Section 7412 (Nonstatutory Review for Violations of Federal Law by Federal Officials; Against All Defendants)

186. Plaintiffs re-allege and incorporate by reference the allegations contained in all preceding paragraphs of this Complaint.

187. The Exemption Proclamation is *ultra vires* as to the continuous emissions monitoring requirement because that requirement of the 2024 Rule rests on statutory authority independent of 42 U.S.C. § 7412 and hence beyond the scope of the exemption provision, which is limited to standards promulgated under "this section." 42 U.S.C. § 7412(i)(4). The continuous emissions monitoring requirement was independently grounded on Section

ED_021114D_00001846-00054

7414(a)(1)(C) of the Clean Air Act, 42 U.S.C. § 7414(a)(1)(C) (authorizing EPA to require "any person who owns or operates any emission source … or who is subject to any requirement of this chapter" to install, use, or maintain monitoring equipment). *See* 89 Fed. Reg. at 38,562 (monitoring requirements "are specifically authorized by" 42 U.S.C. § 7414); 89 Fed. Reg. at 38535 (promulgating continuous emissions monitoring requirement based on "additional authority" under 42 U.S.C. § 7414). Because the continuous emissions monitoring requirement rests on legal grounds separate from Section 7412, the President cannot delay its implementation under Section 7412(i)(4). Insofar as it purports to exempt sources from the continuous emissions monitoring requirement, the Exemption Proclamation is *ultra vires*. 89 Fed. Reg. at 38,535 (promulgating continuous emissions monitoring requirement based on "additional authority" under Section 7414(a)(1)(C)).

188. Because the Exemption Proclamation is beyond the Clean Air Act authority and *ultra vires*, EPA actions implementing or giving effect to the proclamation are similarly beyond the Clean Air Act authority and *ultra vires*.

RELIEF REQUESTED

WHEREFORE Plaintiffs respectfully request that the Court:

189. Declare that the Exemption Proclamation is unlawful and invalid and that the deadlines of the 2024 Rule remain as promulgated;

190. Issue injunctive relief:

a. prohibiting EPA and EPA Administrator Lee Zeldin from implementing, relying on, or giving effect to the Exemption Proclamation, including through its implementation of Clean Air Act Title V's operating permit program;

ED_021114D_00001846-00055

b. directing EPA to promptly notify, in writing, the operators of coal plants listed in Annex 1 and delegated state, local, and/or Tribal permitting authorities that the Exemption Proclamation is unlawful and invalid, and that any coal plants the Exemption Proclamation purported to exempt may not lawfully delay or avoid compliance with the deadlines promulgated by the 2024 Rule by relying on the Exemption Proclamation, and that EPA will object to any Title V permit which permitting authorities propose to issue which contain an exemption from compliance with the 2024 Rule in reliance on the Exemption Proclamation;

191. Awarding Plaintiffs their fees and costs of litigation as authorized by law;

192. Granting such other relief as the Court deems just and proper.

DATED: June 12, 2025

Respectfully submitted,

/s/ Nicholas Morales

Plaintiffs,

v.

DONALD TRUMP, President of the United States, in his official capacity;

U.S. ENVIRONMENTAL PROTECTION AGENCY; *and*

LEE ZELDIN, Administrator of the U.S. Environmental Protection Agency, in his official capacity;

Defendants.

COMPLAINT FOR DECLARATORY AND INJUNCTIVE RELIEF

1. On July 17, 2025, President Donald Trump issued a proclamation purporting to exempt 50[1] chemical manufacturing plants from requirements to monitor and control emissions of hazardous air pollutants like ethylene oxide and chloroprene for two years. *Regulatory Relief for Certain Stationary Sources to Promote American Chemical Manufacturing Security*, 90 Fed. Reg. 34,587 (July 23, 2025) ("HON Proclamation") (Ex. 1). EPA had issued these requirements in its 2024 updates to its hazardous air pollutant standards for more than 200 facilities that manufacture synthetic organic chemicals and polymers and resins in a new rule (known as the "HON Rule").[2] By imposing more stringent requirements to prevent and control toxic air

[1] President Trump's Proclamation listed 52 facilities. Based on a review of EPA facility records, two of those appear to be duplicates.

[2] "HON" stands for "Hazardous Organics NESHAP." "NESHAP" stands for "national emissions standards for hazardous air pollutants," the hazardous air pollutant standards issued under 42 U.S.C. § 7412. The HON Rule covers the synthetic organic chemical manufacturing industry and two groups of polymers and resins manufacturers.

pollutant emissions, the updated HON Rule is estimated to reduce the number of people facing elevated cancer risk from HON emissions by 96 percent.

2. President Trump's HON Proclamation, soon after a request from industry trade groups, unilaterally sweeps away those protections for nearly one-quarter of all HON Rule-regulated facilities, giving facilities in states from Louisiana to Michigan a free pass to continue to pollute and put communities at risk for an additional two years. By granting these exemptions, President Trump has allowed facilities to delay controls for toxic pollutants including ethylene oxide—a known carcinogen linked to lymphoma, leukemia, and breast cancer. He has allowed facilities to forgo leak monitoring and repair requirements that would help timely detect and stop toxic emissions from leaky pumps and vents. He has allowed facilities to postpone updating their operational practices to prevent and minimize toxic emissions during maintenance activities. And he has allowed facilities to forgo fenceline monitoring that would identify when toxic emissions escape a facility's boundaries and poison neighboring communities.

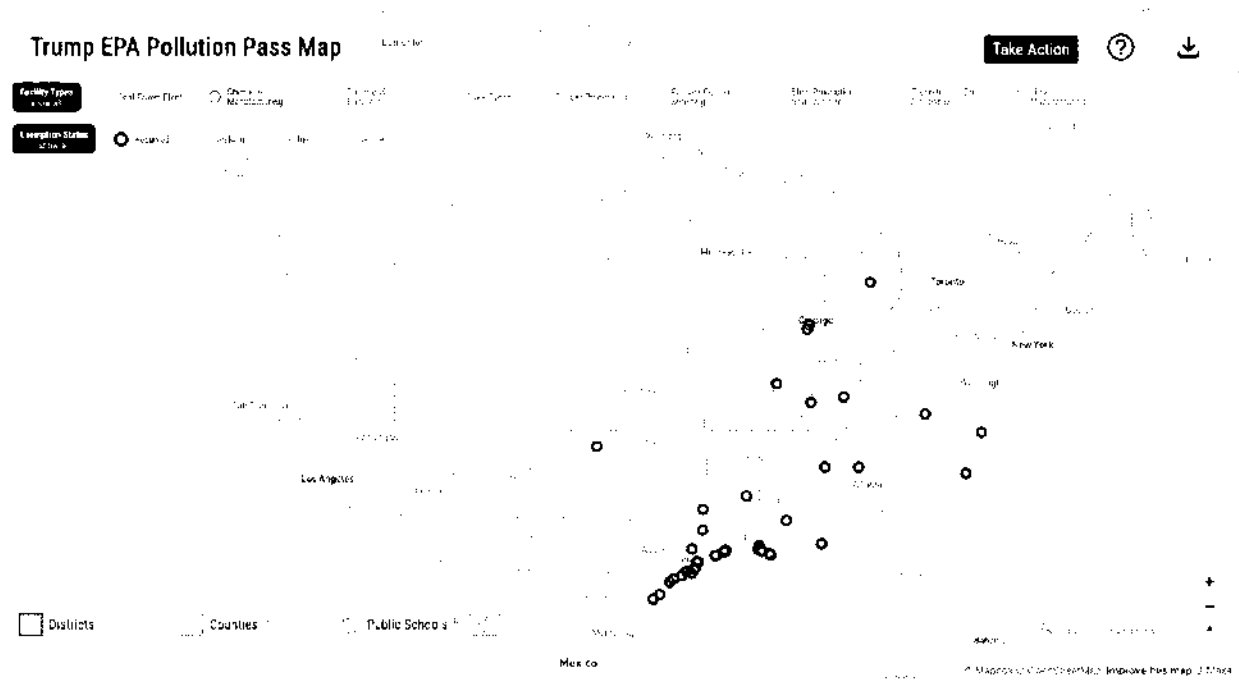

Image from https://www.edf.org/maps/epa-pollution-pass/ (last accessed Oct. 22, 2025)

3. The President granted these sweeping exemptions by seizing on a narrow and, until this year, never-before-used provision of the Clean Air Act, 42 U.S.C. § 7412(i)(4). That provision allows the President to exempt a source from a hazardous air pollutant standard for up to two years only if "the technology to implement" the relevant standard is "not available" and if exempting the source "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4). Neither of those predicates are met here.

4. In the fifty-five years since Congress enacted Section 7412(i)(4), no President had ever used that exemption authority. In just the first six months of his term, President Trump has done so five times for a total of 170 facilities. Besides the HON Proclamation, President Trump has issued proclamations exempting nearly one-third of U.S. coal-fired power plants from mercury and other air toxics standards, nearly half of commercial medical sterilizers from ethylene oxide standards, and the entire taconite iron-ore processing industry from mercury standards.

5. President Trump's sweeping HON Proclamation grossly exceeds the bounds of the Section 7412(i)(4) exemption authority. The Proclamation exempts nearly one-quarter of HON-regulated facilities from complying with any part of the Rule without any standard- or facility-specific analysis to show that any of the 50 specific facilities meets the statutory standard. In fact, many of the 2024 HON Rule's requirements cannot be reasonably understood as turning on any "technological availability," as required to invoke the Section 7412(i)(4) exemption. Rather, they are operational practices and prohibitions that reduce dangerous emissions from existing equipment and processes. For other requirements, the air pollution control technology needed to comply with the standards is widely available in the industry—and indeed already in use by many of the facilities that received exemptions.

ED_021114D_00001944-00004

6. The scope, content, and context of the Proclamation show it for what it really is: a pretext to relieve polluters from working to comply with the 2024 HON Rule while EPA works administratively to repeal those critical protections. Congress explicitly prohibited that sort of delay pending administrative reconsideration. 42 U.S.C. § 7607(d).

7. The Proclamation violates the Clean Air Act and exceeds the President's lawful authority. Plaintiffs ask the Court to enter appropriate relief declaring the Proclamation unlawful and invalid and enjoining EPA and its Administrator from implementing or giving effect to it.

JURISDICTION AND VENUE

8. This Court has subject matter jurisdiction under 28 U.S.C. § 1331 because this is a civil action arising under laws of the United States, including the Clean Air Act.

9. Venue is proper in this Court under 28 U.S.C. § 1391(e) because Plaintiff Environmental Integrity Project resides in this judicial district, because Defendants reside in this judicial district, and because a substantial part of the events giving rise to the claim occurred in this judicial district.

10. The Court has authority to enter a declaratory judgment and to provide injunctive relief pursuant to Rules 57 and 65 of the Federal Rules of Civil Procedure; the Declaratory Judgment Act, 28 U.S.C. §§ 2201-2202; the All Writs Act, 28 U.S.C. § 1651; and the Court's inherent equitable powers.

PARTIES

The Plaintiffs

11. Plaintiff Louisiana Environmental Action Network ("LEAN") is a nonprofit organization based in Louisiana. LEAN is an environmental justice network of community members that advocate for environmental justice and protection from toxic pollution in

Louisiana. Through public education, advocacy, and community organizing, LEAN educates communities about the environmental impacts of industry and development, and empowers them to advocate for protecting human health and the environment.

12. Plaintiff Environmental Justice Health Alliance for Chemical Policy Report ("EJHA") is a national network of grassroots environmental and economic justice organizations and advocates in communities that are disproportionately impacted by toxic chemicals from legacy contamination, ongoing exposure to polluting facilities, and health-harming chemicals in household products. EJHA has over a dozen member community-based environmental justice organizations in ten states. EJHA's member organizations represent communities in areas impacted by hazardous air pollutant emissions, including emissions from HON-regulated facilities. EJHA's mission is to support its affiliate member organizations to achieve a just transition to a pollution-free economy that leaves no community or worker behind.

13. Plaintiff Air Alliance Houston ("AAH") is a nonprofit organization based in Texas. AAH works to reduce air pollution in the Houston region to protect public health and environmental integrity by conducting applied research on air pollution, educating the community about the sources and harms of air pollution, and advocating for improvements at the local, state, and national levels. AAH works closely with constituents to provide the training and technical assistance they need to address air pollution in their daily lives.

14. Plaintiff Concerned Citizens of St. John ("CCSJ") is a nonprofit organization based in St. John the Baptist Parish, Louisiana. CCSJ advocates for community health and safety by working to reduce pollution and to protect the air, water, and soil in Louisiana. CCSJ also works to educate the residents of St. John Parish about environmental pollution and health risks.

ED_021114D_00001944-00006

15. Plaintiff RISE St. James Louisiana is a nonprofit, grassroots, and faith-based organization based in Louisiana. RISE St. James advocates for racial and environmental justice in St. James Parish, Louisiana and in other river parishes impacted by toxic pollution.

16. Plaintiff Texas Environmental Justice Advocacy Services ("t.e.j.a.s.") is a nonprofit organization with its headquarters in Houston, Texas. T.e.j.a.s. promotes environmental protection and environmental justice through education, policy development, community outreach, and legal action to ensure that everyone, regardless of race or income, is entitled to live in a clean environment.

17. Plaintiff Environmental Defense Fund ("EDF") is a nonprofit environmental organization dedicated to finding practical solutions to critical environmental problems through the use of science, economics, policy, and law. EDF regularly collects and publishes data that highlights harm from petrochemical and industrial air pollution, including mapping reported air toxic emissions from petrochemical facilities alongside health risk levels, to provide information to communities and policymakers. *See, e.g.*, Petrochemical Air Pollution Map, https://www.clearcelllab.org/pollutionmap. EDF has offices throughout the United States, including in the District of Columbia. As a membership-based organization, EDF currently has more than 330,000 members, in all 50 states and the District of Columbia. These members have a strong interest in protecting human health and the environment from pollution.

18. Plaintiff Environmental Integrity Project ("EIP") is a nonprofit, nonpartisan organization based in Washington, D.C. that empowers communities and protects public health and the environment by investigating polluters, holding them accountable under the law, and strengthening public policy on toxic air pollution and other environmental health issues. EIP works for more effective enforcement of environmental laws.

19. Plaintiff Natural Resources Defense Council ("NRDC") is a national nonprofit environmental membership organization with hundreds of thousands of members nationwide. NRDC's purpose is to safeguard the Earth — its people, its plants and animals, and the natural systems on which all life depends. Part of NRDC's core mission is to improve air quality and safeguard public health by combating hazardous air pollutant emissions.

20. Plaintiff Sierra Club is a nonprofit corporation with its headquarters located in Oakland, California. The Sierra Club is a national membership organization dedicated to the protection of public health and the environment and regularly advocates for policies that protect clean air. It has chapters in Alabama, Arkansas, Florida, Georgia, Illinois, Indiana, Kentucky, Louisiana, Michigan, Mississippi, North Carolina, Texas, and Virginia, and more than 600,000 members residing in all 50 states, the District of Columbia, and Puerto Rico.

The Defendants

21. Defendant Donald Trump is the President of the United States. He resides and conducts his duties in Washington, D.C. He is sued in his official capacity.

22. Defendant U.S. Environmental Protection Agency ("EPA") is a federal agency of the United States. EPA is headquartered in Washington, D.C.

23. Defendant Lee Zeldin is the Administrator of the U.S. Environmental Protection Agency. He resides and conducts his duties in Washington, D.C. He is sued in his official capacity.

ED_021114D_00001944-00008

LEGAL BACKGROUND

The Clean Air Act's Program to Address Hazardous Air Pollution

24. Clean Air Act Section 112, 42 U.S.C. § 7412, establishes the framework for EPA's regulation of "hazardous air pollutants" from stationary sources, including industrial facilities.

25. "Hazardous air pollutants" for Section 7412 purposes are a group of 188 air pollutants determined by Congress and EPA to be particularly harmful to human health. Ethylene oxide, benzene, 1,3-butadiene, ethylene dichloride, vinyl chloride, and chloroprene are hazardous air pollutants.

26. Section 7412 requires EPA to regulate hazardous air pollutants by issuing emissions standards for categories and subcategories of stationary sources of such pollutants. Emissions standards must require the maximum degree of reduction that EPA deems "achievable," taking into consideration cost and any non-air quality health and environmental impacts and energy requirements. *Id.* § 7412(d)(2), (3)(A)-(B).

27. After EPA establishes Section 7412 standards for a source category, the Clean Air Act requires EPA to perform recurring reviews to ensure that the standards adequately address risks to health and welfare from hazardous air emissions and that they reflect advancements in technology and practice that allow sources to achieve even greater emission reductions. These reviews are often done together and are known as the "residual risk and technology review."

28. In a technology review, EPA must "review, and revise" the Section 7412 standards "as necessary (taking into account developments in practices, processes, and control technologies)." *Id.* § 7412(d)(6).

29. In a risk review, EPA determines whether unacceptable risk to public health remains, or is likely to remain, from hazardous air pollutant emissions even after the application

ED_021114D_00001944-00009

of Section 7412 standards. If unacceptable risk remains, EPA must promulgate additional standards that eliminate the unacceptable risk, "provide an ample margin of safety to protect public health," and prevent "an adverse environmental effect." *Id.* § 7412(f)(2)(A).

30. Congress also prescribed strict compliance schedules for Section 7412 standards. Residual risk-based emissions standards "shall become effective upon promulgation" for new sources, or 90 days after the effective date for existing sources. *Id.* § 7412(f)(3). EPA may waive compliance for up to two years only if it determines "such period is necessary for the installation of controls and that steps will be taken during the period of the waiver to assure that the health of persons will be protected from imminent endangerment." *Id.* § 7412(f)(4)(B).

31. For standards revised as the result of a technology review, EPA must require existing sources to comply "as expeditiously as practicable," and no later than three years after the effective date. *Id.* § 7412(i)(3)(A). EPA may grant a source up to one additional year to comply only where "such additional period is necessary for the installation of controls." *Id.* § 7412(i)(3)(B).

Clean Air Act Procedural Requirements

32. The Clean Air Act sets out rulemaking requirements that apply to "the promulgation or revision of any . . . emission standard or limitation under section 7412(d)." *Id.* § 7607(d)(1)(C). EPA must establish a rulemaking docket, publish a notice of proposed rulemaking in the Federal Register, and provide a statement of basis and purpose for the rule that includes the factual data on which the proposed rule is based, the methodology used in obtaining and analyzing the data, and the major legal interpretations and policy considerations underlying the proposed rule. *Id.* § 7607(d)(3). EPA must also provide, along with the proposal, any

ED_021114D_00001944-00010

comments by the Scientific Review Committee and the National Academy of Sciences and all data, information, and documents. *Id.*

33. The Clean Air Act also requires EPA to allow any person to submit written comment, and to provide an opportunity for oral presentation of data, views, or arguments, on a proposed rule. *Id.* § 7607(d)(5); *see also id.* § 7607(h). In promulgating a final rule, EPA must provide a statement of basis and purpose as required at the proposal stage and must explain major changes from the proposed to final rule. *Id.* § 7607(d)(6)(A). EPA must also provide a response to each of the significant comments, criticisms, and new data submitted during the comment period. *Id.* § 7607(d)(6)(B). EPA may not base a promulgated rule on "any information or data which has not been placed in the docket as of the date of such promulgation." *Id.* § 7607(d)(6)(C).

34. The Clean Air Act also provides procedures for reconsidering a promulgated rule. The EPA Administrator can "convene a proceeding for reconsideration of the rule" but must "provide the same procedural rights as would have been afforded" in the original proceeding. *Id.* § 7607(d)(7)(B). The Act states, however, that reconsideration "shall not postpone the effectiveness of the rule," except that the Administrator or a reviewing court may stay the effectiveness of the rule "for a period not to exceed three months." *Id.* Section 7607(d)(7)(B) is the sole authority EPA has to stay a rule after its effective date has passed. *See Clean Air Council v. Pruitt*, 862 F.3d 1, 9 (D.C. Cir. 2017).

Presidential Exemption Provision

35. Section 7412(i)(4) of the Clean Air Act authorizes the President, in narrowly prescribed circumstances, to "exempt any stationary source from compliance" with hazardous air pollutant standards promulgated under Section 7412, "for a period of not more than 2 years if the

President determines [1] that the technology to implement such standard is not available and [2] that it is in the national security interests of the United States to do so." 42 U.S.C. § 7412(i)(4).

36. The President may extend the original exemption "for 1 or more additional periods, each period not to exceed 2 years." *Id.*

FACTUAL AND PROCEDURAL BACKGROUND

Synthetic Organic Chemical Manufacturing Industry NESHAP

37. In 1994, EPA promulgated the first hazardous air pollutant standards for synthetic organic chemical manufacturing industry ("SOCMI") processes at 40 C.F.R. part 63, subparts F, G, H, and I. 59 Fed. Reg. 19,402 (Apr. 22, 1994). EPA completed a residual risk and technology review for the HON Rule in 2006. 71 Fed. Reg. 76,603 (Dec. 21, 2006).

38. The SOCMI source category comprises any facility engaged in manufacturing processes that produce synthetic organic chemicals. Those chemicals are primarily used to manufacture plastics, as well as rubbers, paints, adhesives, and pesticides. Demand for synthetic organic chemicals is driven by the growth of automotive and packaging sectors in emerging economies like India, Brazil, Vietnam, and Thailand.

39. Emissions from SOCMI facilities are a major driver of cancer risk for millions of Americans. EPA estimated that emissions from the SOCMI source category alone is responsible for one excess cancer case every 6 months. EPA estimated that approximately 50,000,000 people live within 50 kilometers of SOCMI facilities, and that more than 7 million of those are estimated to have cancer risk above EPA's presumptively "unacceptable" rate of 100-in-1 million because of those facilities' emissions.

40. EPA's estimates are based on modeled emissions from SOCMI facilities based on facilities' reported emissions. Studies have shown that actual hazardous emissions are often

ED_021114D_00001944-00012

higher. One study in Louisiana's "Cancer Alley," an 85-mile stretch along the Mississippi River between Baton Rouge and New Orleans that is home to more than 100 petrochemical manufacturers and refineries, found that pollution levels outside the property lines of ethylene oxide-emitting facilities were 10 times higher than EPA estimates.

Polymers and Resins NESHAP

41. In 1995, EPA established the first standards for certain polymer and resins manufacturing processes at 40 C.F.R. part 63, subpart W, known as the Group II Polymers and Resins NESHAP ("P&R II NESHAP"). 60 Fed. Reg. 12,670 (Mar. 8, 1995). EPA completed a residual risk and technology review for the P&R II NESHAP in 2008. 73 Fed. Reg. 76,220, 76,223 (Dec. 16, 2008).

42. In 1996, EPA established the first standards for various elastomer manufacturing processes at 40 C.F.R. part 63, subpart U, known as the Group I Polymers and Resins NESHAP ("P&R I NESHAP"). 61 Fed. Reg. 46,906 (Sep. 5, 1996). EPA completed a residual risk and technology review for those standards in 2008 and 2011. 73 Fed. Reg. at 76,223; 76 Fed. Reg. 22,566 (Apr. 21, 2011).

43. EPA estimated that of the approximately 1,000,000 people live within 50 kilometers of the Denka facility, a neoprene manufacturer that emits chloroprene, 690,000 are estimated to have a cancer risk at or above 1-in-1 million from primarily the chloroprene emitted from Denka's source category emissions, with 2,000 people estimated to have a cancer risk above 100-in-1 million.

The HON Risk & Technology Review

44. In 2010, EPA for the first time published a cancer potency for chloroprene, a pollutant emitted by the P&R I sources producing neoprene, in its Integrated Risk Information

System ("IRIS"). This cancer potency estimate was not available when EPA conducted its initial residual risk and technology review for P&R I source categories in 2008. 88 Fed. Reg. at 25,090. As a result, EPA's initial risk assessment and hazardous air pollutant standards treated chloroprene as presenting zero risk. Chloroprene is a likely human carcinogen that increases the risks of multiple cancers in addition to increasing the risk of non-cancer nervous system, immune system, and respiratory harms.

45. In 2016, EPA updated its IRIS assessment for ethylene oxide, a pollutant emitted by the SOCMI source category. The updated IRIS assessment showed that ethylene oxide was a significantly more potent carcinogen than previously known. Exposure to even small amounts of ethylene oxide increases the risk of lymphoid cancer, such as non-Hodgkin lymphoma, myeloma, and lymphocytic leukemia, as well as breast cancer. Ethylene oxide exposure is also linked to respiratory, nervous system, and hormone disruption. Children are more susceptible to health effects from ethylene oxide exposure.

46. That change in EPA's understanding of health risks led the Agency to determine that it was necessary to conduct an updated residual risk review for the SOCMI and P&R I source categories, in addition to the technology review required under 42 U.S.C. § 7412(d)(6).

47. In its final Residual Risk Assessment for SOCMI sources, EPA found the cancer risks in communities adjacent to HON facilities are "unacceptable," driven in large part by those facilities' ethylene oxide emissions.

48. Without the requirements of the 2024 HON Rule, approximately 83,000 people living within 50 kilometers of SOCMI sources are exposed to "unacceptable" cancer risk above 100-in-1 million, and over 7 million people are exposed to excess cancer risk of 1-in-1 million.

The highest cancer risk from HON sources is 2,000-in-1 million — approximately 20 times higher than the level of risk that EPA considers presumptively "unacceptable."

49. In addition to ethylene oxide and chloroprene, EPA identified at least eight additional hazardous air pollutants emitted by SOCMI sources contributing to risks above 1-in-1-million — which the Agency described as risk "drivers" — including acrylonitrile, ethylene dichloride, naphthalene, vinyl chloride, benzene, hydrazine, acrylamide, and nickel.

50. Even after implementing the controls required by the 2024 Rule, EPA estimates that several pollutants other than ethylene oxide will cause roughly 40 percent of the remaining cancer risk from SOCMI sources. 89 Fed. Reg. 42,957 (May 16, 2024).

51. In its final Residual Risk Assessment for P&R I neoprene production sources, EPA determined that the maximum individual lifetime cancer risk was 500-in-1-million before implementing the requirements of the 2024 Rule, and that 690,000 people living within 50 kilometers of the neoprene production source would be exposed to lifetime cancer risks greater than 1-in-1-million.

52. EPA also conducted a technology review for the SOCMI and P&R source categories. EPA determined that developments in practices, processes, and control technologies warranted revisions to standards for heat exchange systems, storage vessels, and process vents in one or more of the SOCMI and both P&R source categories. EPA promulgated several new requirements to reflect those developments. 89 Fed. Reg. at 42,948-49.

ED_021114D_00001944-00015

The 2024 HON Rule

53. EPA finalized the 2024 HON Rule in May 2024. 89 Fed. Reg. at 42,932. The 2024 HON Rule became effective on July 15, 2024.

54. EPA found that the 2024 HON Rule would reduce hazardous air pollutant emissions by 6,230 tons per year, and reduce the number of local residents facing elevated cancer risks from HON emissions by 96 percent.

55. Though EPA was not able to monetize the benefits from these reductions, EPA found the rule's reductions of volatile organic compound emissions and ozone would yield at least $77 to $690 million (using a 3 percent discount rate). 89 Fed. Reg. at 43,060.

56. The 2024 HON Rule was projected to impose about $455 million in total capital costs across all regulated sources.

57. The total annual cost of the rule is about $168 million.

58. The annual cost represents less than 0.1 percent of the value of the U.S. synthetic organic chemical manufacturing industry, which was valued at $168 billion in 2022.

59. The 2024 HON Rule established a variety of requirements applicable to different chemical manufacturing process units ("CMPUs"). Different HON facilities have different arrays of CMPUs, and thus are subject to different combinations of requirements from the 2024 HON Rule. For example, facilities that do not use or emit ethylene oxide would not be required to comply with ethylene oxide-specific requirements.

60. Different HON facilities emit different arrays of hazardous organic air pollutants.

61. For instance, the Formosa Plastics facility in Baton Rouge, Louisiana, is a plastics and resins manufacturer that emitted at least 21 hazardous air pollutants in 2024, including benzene, chloroprene, dioxins, and vinyl chloride.

62. The Westlake Vinyls facility in Geismar, Louisiana, is a plastics and resins manufacturer that emitted at least 29 hazardous air pollutants in 2024, including benzene, chloroprene, dioxins, ethylene oxide, and vinyl chloride.

63. The Citgo Petroleum Corporation Lemont Refinery is a petroleum refinery that emitted at least 34 hazardous air pollutants in 2024, including benzene and 1,3-butadiene.

64. The 2024 HON Rule standards can be grouped and summarized as follows:

65. *Ethylene oxide control requirements:* The 2024 HON Rule requires facilities that use, store, or emit ethylene oxide to reduce ethylene oxide emissions from process vents and storage vessels by either (1) venting the ethylene oxide to a control device that reduces ethylene oxide by a certain amount (for example, greater than or equal to 99.9 percent by weight), or (2) venting the ethylene oxide to a flare that meets preexisting performance, operation, and maintenance requirements. *See* 40 C.F.R. §§ 63.113(j) (process vents), 63.119(a)(5) (storage vessels). The Rule also sets new standards for wastewater containing ethylene oxide, including certain control measures and a prohibition on disposing of such wastewater through any heat exchange system. *Id.* § 63.104(k). The Rule prohibits bypassing air pollution controls for equipment that carries ethylene oxide and makes an atmospheric release from a pressure relief device a violation of the standard. *See* 89 Fed. Reg. at 42,957, 43,017; 40 C.F.R. § 63.165(e)(3)(v)(D). The compliance deadline for these provisions is July 15, 2026. 40 C.F.R. § 63.100(k)(11).

66. *Fenceline monitoring and corrective action requirements:* The 2024 HON Rule requires facilities that use, store, or emit one or more of benzene, 1,3-butadiene, chloroprene, ethylene dichloride, ethylene oxide, and vinyl chloride to sample along the facility's property boundary (known as the "fenceline"). 40 C.F.R. § 63.184. The Rule provides standardized

sampling procedures for each of the pollutants. *See id.* § 63.184(b), (c). The Rule also creates an "action level": if the samples show concentrations of any of the six pollutants above a certain concentration, the facility's owner or operator must take specified actions to identify the root cause of the exceedance and take corrective action, including actions to prevent future exceedances. *Id.* § 63.184(d)(3), (e), (f). The compliance deadline for fenceline monitoring is July 15, 2026, and the compliance deadline for corrective action is July 15, 2027. *Id.* § 63.100(k)(12).

67. *Leak detection and repair requirements:* The 2024 HON Rule requires facilities to implement new leak detection and repair requirements for certain equipment in ethylene oxide service to more quickly identify and correct leaks. These requirements include more frequent monitoring, with a lower leak concentration requiring repair, shorter deadlines to repair leaks, and limitations on any delay of repair. *See, e.g.*, 40 C.F.R. §§ 63.104(g)(6), 63.174(a)(3), (b)(3)(vi), (d) (g)(3), § 63.171(f). The compliance deadline for these requirements is July 15, 2026. *Id.* § 63.100(k)(11). The 2024 HON Rule also requires facilities to implement new leak detection and repair requirements for heat exchange systems generally, and the compliance deadline for those requirements is July 15, 2007, *id.* § 63.100(k)(10).

68. *Work practice standards:* The 2024 HON Rule establishes work practice standards for pressure relief devices and maintenance activities designed to prevent or minimize hazardous air pollutant emissions during maintenance activities or upsets. For instance, the Rule requires facilities with pressure relief devices that vent to the atmosphere to implement three release prevention measures such as routine inspection and maintenance programs or operator training; to monitor pressure relief devices and take corrective action if there are emissions. 40 C.F.R. § 63.165(c)(3)(i)-(iii). The Rule also prescribes how and when operators can open process

ED_021114D_00001944-00018

equipment, including recordkeeping requirements and restrictions on the amount of ethylene oxide released from maintenance vents, and standards for maintenance on storage vessels. *See id.* §§ 63.113(k), 63.119(b)(7) (work practice standards during planned routine maintenance of a fixed roof and an internal floating roof used for storage vessel compliance with total organic HAP emission control requirements). The compliance deadline for these provisions is July 15, 2027. *Id.* § 63.100(k)(10).

69. *Bypass prohibition:* The 2024 HON Rule prohibits owners and operators of HON facilities from bypassing an air pollution control device at any time, and provides that in most instances bypassing a control device is a violation of the applicable emission standard. 40 C.F.R. §§ 63.114(d)(3) (process vents), 63.119(e)(7) (storage vessels), 63.127(d)(3) (transfer racks), 63.148(f)(4) (vapor collection systems and closed vent systems). The compliance deadline for these provisions is July 15, 2027. *Id.* § 63.100(k)(10).

70. *Operating and monitoring requirements for flares:* The Rule sets revised operating and monitoring requirements for flares used as air pollution control devices. *See, e.g., id* §§ 63.108, 63.508. The Rule's requirements mirror and cross-reference the flare requirements promulgated in EPA's 2015 hazardous air pollutant rules for refineries. These revisions include a requirement that facilities operate at a minimum and monitor the net heating value of gases at the flare combustion zone, taking into account any "assist" steam or air added to the stream. The Rule also requires the use of certain methodologies to determine compliance. *See id.* §§ 63.108(a), (c), 63.508(a).

71. EPA determined that existing HON sources could comply with the requirements of the HON Rule within the statutory timeframes of two years (for section 7412(f) ethylene oxide requirements) and three years (for section 7412(d) technology-based requirements) by

July 15, 2026, and July 15, 2027, respectively. 89 Fed. Reg. at 42,953-55. Each of these is the maximum compliance timeframe allowed under the statute. EPA also determined that HON sources could comply with fenceline monitoring requirements within two years, and fenceline monitoring root cause analysis and corrective action requirements within three years. *Id.* at 42,954.

72. On January 31, 2025, the industry trade groups American Chemistry Council and the American Fuel and Petrochemical Manufacturers filed a petition for reconsideration of the HON Rule, requesting a broad rollback of the Rule's standards. The industry groups also requested that EPA "provide interim relief . . . while EPA takes regulatory action or addresses the more detailed issues" in the reconsideration petition. Among the options for interim relief suggested by the industry groups was that EPA "should request that the President provide national security exemptions under § 112(i)(4)."

73. Less than two months later, on March 12, 2025, in a press event billed as "the greatest day of deregulation our nation has seen," EPA announced that it would "reconsider" the 2024 HON Rule and 31 other regulations protecting human health and the environment. EPA, News Release, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://perma.cc/EXL5-FAMQ (last visited Oct. 21, 2025).

74. Along with its press release, EPA published a "fact sheet" about its planned reconsideration of the HON Rule and seven other recent hazardous air pollutant rules. That fact sheet included an invitation that "[a]ny source interested in a Presidential exemption" from any of the eight rules, "should provide their recommendations to EPA by March 31, 2025." EPA, *Oil and Gas Regulations: Powering the Great American Comeback Fact Sheet* 3, https://perma.cc/L8UM-RN3K (last visited Oct. 21, 2025). The Fact Sheet further explained,

"Sources need only provide why technology is unavailable and why it is in the national security interests of the United States to provide the exemption." *Id.*

75. Following up on its invitation to request exemptions, on or about March 24, 2025, EPA posted a new webpage announcing it had established "an electronic mailbox"—airaction@epa.gov "to allow the regulated community to request a Presidential Exemption under section 112(i)(4)." EPA, *Clean Air Section 112 Presidential Exemption Information* (last updated Apr. 14, 2025), https://perma.cc/WKL5-44FC (last visited Oct. 21, 2025). EPA asked that requests be submitted "by March 31, 2025," a week after the webpage was posted. *Id.*[3]

76. EPA did not solicit any information from the public, or provide any opportunity for public comment.

77. Facility owners and operators across multiple source categories sent exemption requests to that email inbox. Many requests urged the President to interpret the statutory considerations of technological availability and national security to encompass the cost of compliance and economic "security" and development. The industry trade groups American Chemistry Council and the American Fuel and Petrochemical Manufacturers also submitted a request for a blanket two-year exemption from the HON rule for all covered facilities.

The HON Proclamation

78. On July 17, 2025, President Trump issued a proclamation exempting a list of HON-regulated facilities from "those aspects of the HON Rule that were promulgated under section 112 of the Clean Air Act, 42 U.S.C. 7412 for a period of 2 years beyond the HON Rule's relevant compliance dates." 90 Fed. Reg. at 34,587. The HON Proclamation cited "authority

[3] EPA has since removed much of the information in an April 14, 2025 update to the webpage. *See* EPA, *Clean Air Act Section 112 Presidential Exemption Information,* https://perma.cc/WKL5-44FC (last visited Oct. 21, 2025).

vested in [the President] by the Constitution and the laws of the United States, including section 112(i)(4) of the Clean Air Act, 42 U.S.C. 7412(i)(4)." *Id.* The HON Proclamation stated that it "applies to all compliance deadlines established under the HON Rule applicable to the stationary sources listed in Annex I, with each such deadline extended by 2 years from the date originally required for such deadline." *Id.*

79. The Exemption Proclamation included what it referred to as two "determinations."

80. First, the Exemption Proclamation purported to "determine" that "[t]he technology to implement the HON Rule is not available," stating that "[s]uch technology does not exist in a commercially viable form sufficient to allow implementation of and compliance with the HON Rule by the compliance dates in the HON Rule." *Id.* at 34,588.

81. Second, the Exemption Proclamation purported to determine that "[i]t is in the national security interests of the United States to issue this Exemption for the reasons stated in paragraphs 1 and 3 of this proclamation." *Id.* Paragraph 1 asserted that "[m]aintaining a robust domestic chemical industry is vital to safeguarding the supply chains that underpin our economy and to reducing the Nation's dependence on foreign control over materials critical to national resilience." *Id.* at 34,587. Paragraph 3 asserted that "[t]he HON Rule imposes substantial burdens on chemical manufacturers already operating under stringent regulations," and posited that "the timeline for compliance" with the HON Rule "would require shutdowns or massive capital investments before any proven pathway to compliance exists" and would "weaken key supply chains, increase dependence on foreign producers, and impair our ability to respond effectively in a time of crisis." *Id.*

82. The Exemption Proclamation and "Annex I" were published in the Federal Register on July 23, 2025. *Id.* at 34,587-91.

83. The Exemption Proclamation included no facility-, standard-, or technology-specific determinations. Instead, the Exemption Proclamation broadly and conclusory purported to "determine" that the technology to implement the 2024 HON Rule (in its entirety) was not available and that exemptions are in the national security interests of the United States.

84. For example, the HON Proclamation purports to exempt from ethylene oxide standards facilities that do not emit ethylene oxide, and thus to which the ethylene oxide control requirements do not apply.

85. The HON Proclamation purports to exempt from fenceline monitoring requirements facilities that have successfully implemented fenceline monitoring, either due to consent decree requirements or the requirements of other hazardous air pollutant standards.

86. The HON Proclamation purports to exempt from ethylene oxide control requirements facilities that already have air pollution control devices and/or flares that would meet those standards.

87. The HON Proclamation purports to exempt facilities from requirements for which "technology" is not needed to "implement" the standards, such as more frequent leak monitoring.

88. The HON Proclamation purports to exempt from the HON standards facilities that have or are in the process of retiring their HON-regulated units.

89. The HON Proclamation's indiscriminate exemptions apply without any consideration of whether the facilities have the technology and operational capability to implement the 2024 HON Rule's standards.

Technology to implement the Rule's requirements is widely available

90. The Proclamation's unsupported determinations are unambiguously contradicted by factual evidence, including EPA's own findings and record for the 2024 HON Rule.

91. *Ethylene oxide control requirements*: Technology to implement the ethylene oxide control requirements is widely available.

92. For example, for the requirement to control emissions from process vents using ethylene oxide, the Rule allows facilities a range of options, including that they may use a control device that reduces ethylene oxide to by greater than or equal to 99.9 percent by weight or may simply use a flare operating in compliance with the revised operating and monitoring requirements. *See* 40 C.F.R. § 63.113(j).

93. Air pollution control devices that are capable of meeting the standards are commercially available and feasible to implement.

94. Flares that are capable of meeting the standards are commercially available and feasible to implement. Many exempted facilities already possess and operate flares capable of meeting the standards.

95. The exempted facilities either do not need any technology to implement aspects of these standards, already have in place the technology necessary to implement other aspects of the standards, or can obtain the widely commercially available and technically feasible technology to implement other aspects of these standards.

96. The same air pollution control devices or flares needed to comply with the control requirements of the 2024 HON Rule are widely used by owners and operators of equipment and processes that are subject to similar ethylene oxide standards imposed in 2020 by the

ED_021114D_00001944-00024

Miscellaneous Organic Chemical Manufacturing hazardous air pollutant standards (known as the "MON Rule").

97. Many facilities regulated by the MON Rule are co-located with equipment and processes regulated by the HON Rule. On information and belief, only 14 of the exempted facilities would be subject to the ethylene oxide control requirements of the 2024 HON Rule. On information and belief, 9 of those 14 exempted facilities are subject to the MON Rule. As discussed below, EPA assumed for certain HON facilities co-located with MON facilities that "the HON facility likely upgraded at least one HON flare already." It is therefore likely that many of the exempted facilities already have the required control technology in place.

98. Technology to implement the 2024 HON Rule's ethylene oxide wastewater controls is available.

99. The controls for wastewater streams in ethylene oxide service can be implemented with a device called a steam stripper, a technology and a method that has been available since at least 1992, when EPA analyzed the effectiveness of steam stripping to remove organic pollutants from wastewater streams in the original HON rulemaking.

100. HON-regulated facilities already use the technological controls necessary to comply with the wastewater requirements on non-ethylene oxide wastewater streams.

101. *Fenceline monitoring*: Technology to implement the fenceline monitoring requirement is available.

102. The majority of exempted facilities would only be required to use passive diffusive tube monitors to comply with the fenceline monitoring requirements for benzene, chloroprene, 1,3-butadiene, and ethylene dichloride. Fenceline monitoring with passive diffusive

tube monitors has been successfully implemented in the petroleum refineries source category since 2018.

103. Many refineries are co-located with HON-regulated processes. On information and belief, of the 39 exempted facilities that would be required by the 2024 HON Rule to conduct passive fenceline monitoring for at least one pollutant, 10 of these facilities are already conducting this very same passive fenceline monitoring consistent with the standards for the refineries source category.

104. The monitoring technology used by refineries since 2018 is the same technology that the 2024 rule requires for measuring benzene, chloroprene, 1,3-butadiene, and ethylene dichloride. Under the 2024 HON Rule, the majority of HON-regulated sources, including the majority of exempted facilities, would be required to conduct only the passive diffusive tube monitoring.

105. Some facilities would be required to use canister sampling technique Method 327 to comply with the fenceline monitoring requirements for ethylene oxide and vinyl chloride. On information and belief, only 17 of the 50 exempted facilities would be required to use canister monitoring under Method 327.

106. Canister sampling using Method 327 is an available technology.

107. Canister sampling has been an EPA-approved method since at least 1989. The differences between Method 327 and its immediate precursor (Method TO-15A) have to do with "Best Practices" and "enhanced [quality assurance/quality control]," 89 Fed. Reg. at 43,008, not a change in the underlying sampling technology.

108. In developing the 2024 Rule, EPA requested fenceline monitoring data from eleven HON facilities. EPA required that these facilities use a modified Method TO-15 for

ED_021114D_00001944-00026

certain pollutants, in effect requiring what would become Method 327. The subject facilities were able to comply.

109. Today, multiple laboratories in the United States are offering Method 327 services. Canister sampling using Method 327 is an available technology.

110. *Leak detection and repair requirements:* Technology to implement the 2024 Rule's leak detection and repair requirements is available.

111. The technology to monitor heat exchange systems employs common sampling and analysis methods. As such, the Rule does not require facilities to install or implement any new technology.

112. For connectors in ethylene oxide service, the Rule simply requires facilities to conduct the same kind of leak detection practices using the same devices or equipment that facilities had already conducted pursuant to the previous HON requirements, but on a more frequent basis and with quicker repair based on a lower leak concentration. The updated requirements apply narrowly to a subset of facilities subject to the Rule—just those that use ethylene oxide, which EPA estimated only to be 15 existing facilities at the time.

113. *Work practice standards*: Technology to implement work practice standards is available.

114. The work practice standards for pressure relief devices, storage vessels, and other equipment are implemented through routine inspection and maintenance, operator training, and

the use of widely available devices including flow indicators, level indicators, temperature indicators, pressure indicators.

115. *Bypass prohibition*: The bypass prohibition requirements do not require facilities to install or implement any new technological controls; it simply prohibits facilities from bypassing the controls that currently exist.

116. *Flare operating and monitoring standards*: Technology to comply with the Rule's flare operating and monitoring requirements is widely available.

117. For many exempted facilities, the necessary technology to comply with the flare operating and monitoring standards is already in place.

118. The 2024 HON Rule incorporates by reference the flare operating and monitoring requirements established in the 2015 Refineries Rule, which have long been in effect. *See* 40 C.F.R. §§ 63.108(a), 63.508(a). Many exempted facilities are also regulated under that Refineries Rule.

119. There is no need to install new technology to implement many of the flare operating and monitoring requirements. Certain of the revised operating and monitoring requirements do not necessitate additional equipment, or such equipment is already in place at exempted facilities. For example, the requirement for facilities to use a shorter averaging time is

ED_021114D_00001944-00028

important for the purposes of compliance, but only requires different calculations and not different equipment.

120. EPA estimated that only about half of HON-regulated operators may need to make some upgrades to better monitor and operate their existing flares.

121. Even where the installation of new monitoring equipment may be required, all of this technology is readily available and already in use.

122. Refineries have complied with the flare operating and monitoring requirements since 2019, and other types of petrochemical facilities—such as MON and ethylene production have complied since 2023. Of the exempted facilities, 12 are co-located with refineries, 21 are co-located with units subject to the MON rule, and three are co-located with ethylene production units. A total of 29 exempted facilities are therefore co-located with one or more of these other units.

123. In the 2024 HON Rule, EPA assumed that HON-regulated facilities that are co-located with MON or ethylene production sources had likely upgraded at least one of their HON-regulated flares already. Many of the exempted facilities, therefore, likely already have the technology required to implement the standard in place.

The Court's equitable authority to review ultra vires Executive action

124. The Exemption Proclamation exceeds the President's statutory authority because, by granting sweeping exemptions to one quarter of regulated sources without making facility-, standard-, or technology-specific determinations, the Proclamation exceeds the bounds of the President's Section 7412(i)(4) authority.

125. The Proclamation effectively amends the compliance dates of EPA's 2024 Rule, an action outside the bounds of Section 7412(i)(4). Section 7412(i)(4) is a narrow exemption

ED_021114D_00001944-00029

applicable in specific statutorily defined circumstances; it does not give the President authority to amend EPA standards. Only EPA may amend those standards and only after notice and comment rulemaking.

126. Case law in this Circuit generally allows for review of presidential actions to ensure conformity with statutory requirements, provided that "the authorizing statute or another statute places discernible limits on the President's discretion." *Mountain States Legal Found. v. Bush*, 306 F.3d 1132, 1136 (D.C. Cir. 2002) (citing, *inter alia*, *Chamber of Com. of the U.S. v. Reich*, 74 F.3d 1322, 1331 (D.C. Cir. 1996)).

127. The statutory provision at issue, Section 7412(i)(4), provides such discernable limits on the President's discretion by requiring a determination that, for specific facilities, "technology to implement" a standard "is not available" and that the exemption "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4).

128. The Court has the power to review the Proclamation to discern whether the President's exercise of statutory authority was unlawful because the necessary factual predicate required by the Clean Air Act is not present, and because the HON Proclamation unlawfully exercises authority not conveyed by Section 7412(i)(4), contrary to Congress's explicit restrictions on stay regulations and compliance deadlines. The Court therefore has the power to declare the HON Proclamation is unlawful and *ultra vires*.

STANDING

129. Plaintiffs' members live, work, and recreate in areas affected by the excess pollution that is and will be emitted from the exempted facilities. Plaintiffs' members are harmed

ED_021114D_00001944-00030

by breathing air pollution from the exempted facilities and are concerned that exposure to hazardous air pollutants from the exempted facilities could have harmful impacts on their health.

130. Plaintiffs' members stood to benefit from the ethylene oxide requirements, which were slated to go into effect July 15, 2026. Exempted facilities are now able to emit toxic air pollution at higher levels than otherwise would have been allowed, for years beyond the Rule's mandate. Plaintiffs' members are harmed by the excess emissions that will result from the HON Proclamation exemptions.

131. Plaintiffs' members also stood to benefit from the leak detection and repair requirements, maintenance work practice standards, and other requirements that were slated to go into effect July 15, 2027. Exempted facilities are now not required to comply with operational practices, monitoring, and prohibitions that would reduce the emission of toxic air pollutants. Plaintiffs and plaintiffs' members are harmed by the excess emissions that will result from the HON Proclamation exemptions.

132. Exposure to ethylene oxide, chloroprene, vinyl chloride, benzene, 1,3-butadiene, and other hazardous air pollutants emitted by exempted facilities causes adverse health effects.

133. On average, census blocks containing the exempted HON-regulated facilities face cancer risks of 71 per million, compared to national cancer risk average of 28 per million. In some affected communities, the cancer risk is 300 or 400 per million, 10 to 14 times greater than the national average. In these communities, 38 percent of cancer risk can be attributed to industrial pollutant sources like HON-regulated facilities, as opposed to the national average of just 2 percent attributable to industrial pollution sources.

134. Plaintiffs' members also stood to benefit from reduced exposure to the pollutants subject to the fenceline monitoring requirements, also slated to go into effect July 15, 2026.

Facilities subject to the fenceline monitoring requirements would have to take corrective action that would reduce hazardous air pollutant emissions. The exemptions remove those requirements and increase the likelihood of hazardous pollutant exposures in the communities surrounding the exempted facilities. Plaintiffs and their members are harmed by increased exposure to hazardous air pollutants as a result of the HON Proclamation.

135. The HON Rule fenceline monitoring provisions also require facilities to submit quarterly fenceline emissions reports to EPA, which EPA then makes available to the public. The HON Proclamation exempts Annex I facilities from fenceline monitoring requirements. Those exemptions deny Plaintiffs and their members the emissions information those reports would provide.

136. Some Plaintiffs and their members would use such information to raise public awareness of air pollution and to further Plaintiffs' and their members' advocacy, education, and outreach efforts to reduce air pollution and protect public health. Plaintiffs and their members will be deprived of information they would have used to evaluate their pollution exposure and health risks in areas affected by emissions from the exempted facilities. That information would also allow some Plaintiffs to make educated decisions about how they engage in advocacy to reduce air pollution. Plaintiffs and Plaintiffs' members are therefore harmed by the HON Proclamation exemptions.

137. For example, Plaintiff EJHA works to provide organizing, capacity, and technical support to communities and enhance the public's understanding of the health and safety implications of hazardous chemicals. In collaboration with the Coalition to Prevent Chemical Disasters, EJHA launched and now maintains an online tracker that tracks incidents involving hazardous chemicals. EJHA also offers information and analysis based on publicly reported

ED_021114D_00001944-00032

facility emissions information to educate and support its member affiliate organizations to build grassroots power to remedy and redress the health and safety legacy of chemical pollution in their affiliates' communities.

138. For example, EJHA has created facility profiles from emissions data for specific facilities of concern in EJHA affiliate communities. EJHA has used facility emissions data to support affiliates in commenting on facility air permits, including for some HON facilities. EJHA has used facility emissions data to contribute to comments on the 2024 HON Rule and other EPA rulemakings that address chemical facilities. EJHA uses facility emissions data to provide affiliate members with information to advocate within their home communities, and to connect affiliates' localized pollution concern to federal policy.

139. EJHA also convenes and facilitates a joint working group on hazardous facilities with the environmental health network Coming Clean. Several EJHA member organizations participate regularly in the Hazardous Facilities Team, which supports information sharing between place-based environmental justice groups working on local issues and campaigns related to the impacts of hazardous facilities (including HON facilities) in their neighborhoods and provides a space for translating local needs into federal policy. The Team works collaboratively to advance federal policies that will support local needs and establish a more protective "floor" of protections from hazardous facilities at the federal level to protect all communities across the country. Reducing exposure to and cancer and other health effects harms from hazardous air pollutants like ethylene oxide, chloroprene, 1,3-butadiene and dioxins has been a top priority of this Team since its inception.

140. EJHA's affiliate members have members in communities like Westlake, Louisiana, Louisville, Kentucky, and Houston, Texas, which are home to facilities that received

ED_021114D_00001944-00033

exemptions under the HON Proclamation. Because of the exemptions, EJHA will be deprived of emissions information that would allow it to support its member organizations and effectively advocate in furtherance of its mission.

141. EJHA has advocated extensively for fenceline monitoring in the HON Rule and other NESHAP rules, as well as in other policy spaces. EJHA believes fenceline monitoring data (particularly when made available in real time) is critical to community members' ability to take action to protect themselves and their families in times of chemical release and other pollution incidents. Several EJHA affiliate member organizations have as a core tenet of their local work and mission providing community members accurate pollution information and emergency planning and preparedness training in the absence of prevention requirements at the federal level or adequate emergency preparedness and communication at the local level. There is also reason to expect that the 2024 HON Rule's fenceline monitoring requirements would help to prevent catastrophic chemical disasters in EJHA affiliate members' communities by providing earlier warning of a malfunction or other issues before they become a disaster.

142. Jim Vandenbosch is a member of NRDC. He lives less than three miles from the Citgo Petroleum Corporation Lemont Refinery, which received an exemption under the HON Proclamation. The Lemont Refinery emits, among other hazardous air pollutants, 1, 3-butadiene and benzene. Mr. Vandenbosch regularly smells a strong chemical odor from the direction of the refinery and has observed plumes and fires coming from the facility. As a result of the HON Proclamation, the Lemont Refinery will emit more hazardous air pollutants during the two-year exemption period. Mr. Vandenbosch is concerned about the health risk of exposure to the hazardous air pollutant emissions from the Lemont Refinery.

143. Sharon Cayette Lavigne is the Director/Founder and a member of RISE St. James. She is a lifelong resident of St. James, Louisiana. Ms. Lavigne lives and regularly visits areas near numerous Louisiana facilities that have received exemptions under the HON Proclamation. These include the Denka Performance Elastomer facility in St. John the Baptist Parish, and the DuPont Specialty Products Pontchartrain Site in St. John the Baptist Parish; and the BASF North Geismar site, BASF Geismar site, Shell Geismar chemical plant, Westlake Vinyls plant, and Rubicon Geismar plant in Ascension Parish. These five facilities in Ascension Parish are located directly across the Mississippi River from where one of Ms. Lavigne's granddaughters lives. Another of Ms. Lavigne's granddaughters attends Southern University Laboratory School which is 3.7 miles from the Formosa Plastics Plant in Baton Rouge. Ms. Lavigne is concerned about her own and family members' exposure to the hazardous air pollutant emissions from these facilities that will continue for an additional two years due to the HON Proclamation. Ms. Lavigne is specifically concerned for these facilities' effects on her own health, as she already has health issues including autoimmune hepatitis. Because of the HON Proclamation, Ms. Lavigne is concerned that these facilities will not have to comply with fenceline monitoring requirements or the more stringent controls of the HON Rule and will emit more hazardous air pollutants during the two-year exemption period.

144. Diana LeBlanc is a resident of Port Allen, Louisiana and a member of LEAN. Ms. LeBlanc lives and spends time near the Dow facility in Plaquemine, Louisiana and the Formosa facility in Baton Rouge, both of which received exemptions under the HON Proclamation. Ms. LeBlanc suffers from asthma and an immune deficiency disorder, and she is concerned that hazardous air pollution from these facilities will worsen these conditions and expose her and her family to other health risks, including cancer.

145. Concerned Citizens of St. John and Environmental Defense Fund member Letitia Taylor lives in St. John the Baptist parish in Louisiana, about one mile from Denka Performance Elastomer's neoprene plant, which received an exemption under the HON proclamation. While producing neoprene, the Denka facility emits chloroprene, a dangerous chemical. Due to the HON proclamation, the Denka facility will be allowed to continue to emit hazardous air pollutants during the two-year extension. Ms. Taylor is concerned about the impacts of Denka's emissions on her and her family's health, and she spends less time outdoors due to these concerns.

146. Melanie Oldham is a Sierra Club member and lives five miles from the exempted BASF facility in Freeport, Texas. Ms. Oldham suffers from frequent coughs and colds and is concerned about the impacts of the air pollution from the BASF Freeport facility, among other facilities, on her health. She avoids spending time outdoors, and enjoys the time she does spend outdoors less, as a result of these concerns.

147. Jennifer Hadayia is the Executive Director of Air Alliance Houston, an organization dedicated to reducing the public health impacts of air pollution in the Houston area. Ms. Hadayia lives in Houston, Texas, and regularly travels throughout Harris County for work and to visit family. As a result, Ms. Hadayia spends time near HON facilities, including the exempted Celanese Clear Lake and Ineos Styrolution facilities in Pasadena, Texas. Ms. Hadayia is concerned about the impact of these facilities' pollution on her health.

148. Ana Parras is the co-founder and executive co-director of t.e.j.a.s. Ms. Parras lives approximately halfway between the Houston Ship Channel and downtown Houston, near many HON facilities, including the exempted Celanese Clear Lake and INEOS Styrolution facilities in Pasadena. Ms. Parras suffers from hypersensitivity pneumonitis, a respiratory condition that

ED_021114D_00001944-00036

makes it difficult to breathe. Ms. Parras is concerned about the impacts of the exempted facilities' emissions on her health. Ms. Parras and t.e.j.a.s. participated in the rulemaking process underlying the HON Rule, as well as litigation defending the rule against industry legal challenges. Ms. Parras is concerned that the exemptions will delay compliance with the HON Rule's fenceline monitoring requirements at nearby facilities. Without these fenceline monitoring requirements, t.e.j.a.s. will not be able to fully inform its constituents about potential exposure level, diminishing its ability to educate and conduct outreach to its constituents. The exemption for compliance with the fenceline monitoring requirements would also delay pollution reductions and deprive Ms. Parras, her family, and T.e.j.a.s.'s constituents of the health protections that fenceline monitoring would provide.

CLAIMS FOR RELIEF

COUNT ONE:
Unlawful Executive Action in Violation of the Clean Air Act
(Nonstatutory Review for Violations of Federal Law by Federal Officials; Against All Defendants)

149. Plaintiffs incorporate by reference Paragraph 1-148.

150. The President has limited authority to exempt stationary sources from duly promulgated hazardous air pollutant regulations solely by virtue of the authority delegated by Congress in 42 U.S.C. § 7412(i)(4). The President lacks any independent authority under the U.S. Constitution to issue the exemptions.

151. Section 7412(i)(4) permits the President to exempt a source from a hazardous air pollutant standard only if "the technology to implement such standard is not available" and if an exemption is in the national security interests of the United States.

152. Whether technology to implement a standard is or is not available is a discrete, yes-or-no factual inquiry that limits the President's discretion to grant exemptions.

ED_021114D_00001944-00037

153. Section 7412(i)(4) establishes a judicially manageable standard with clear and precise limits of the sort federal courts routinely construe to determine whether officials have acted consistent with law.

154. There is no statutory basis for the President's indiscriminately broad determinations that technology to implement the 2024 HON Rule is not available or that granting exemptions from that Rule is in the national security interests of the United States. The President patently misconstrued the statutory terms "technology" and "not available" in purporting to exercise the Section 7412(i)(4) exemptions authority.

155. The HON Proclamation's purported determination that technology needed to implement the various diverse standards of the 2024 HON Rule is not available for various diverse HON-regulated facilities is a conclusory statement without specific findings as to any specific standard, any specific technology, or any specific facility.

156. Technology to implement the 2024 HON Rule is in fact available. The relevant technologies to implement each aspect of the 2024 HON Rule standards are in widespread use among chemical manufacturers regulated by the HON Rule and similar regulated sources.

157. Other requirements of the 2024 HON Rule do not require facilities to obtain or deploy any new "technology" within the meaning of Section 7412(i)(4). For instance, leak monitoring requirements simply require more frequent monitoring of the same type the exempted sources are already required to undertake. Similarly, maintenance work practice standards simply require different operational practices to prevent and minimize emissions during maintenance activities facilities already undertake.

158. The purported determination that technology to implement the standards is not available is unambiguously contradicted by factual evidence. The HON Proclamation's cursory and conclusory statements to the contrary cannot be credited.

159. The President's purported determination that the technology to implement the 2024 HON Rule is not available rests on an unlimited, untenable interpretation and application of the authority conveyed by Section 7412(i)(4) of the Clean Air Act.

160. The President patently misconstrued the statutory term "national security" in purporting to exercise the Section 7412(i)(4) exemptions authority.

161. National security concerns "only those activities of the Government that are directly concerned with the protection of the Nation from internal subversion or foreign aggression, and not those which contribute to the strength of the Nation only through their impact on the general welfare." *Cole v. Young*, 351 U.S. 536, 544 (1956).

162. The HON Proclamation's purported determination that it is in the national security interests of the United States to issue the exemption is a conclusory statement that reveals no specific consideration whether the varied chemical products produced by exempted sources—including chemicals used for artificial sweeteners, cleaning agents, dyes and textiles, household and personal care products, pesticides, and plastic packaging have any national security nexus.

163. The HON Proclamation's purported determination that it is in the national security interests of the United States to issue the exemption is a conclusory statement without specific findings that the purported compliance burdens on any specific facility threatens national security.

ED_021114D_00001944-00039

164. The President's overly broad interpretation of "national security" is inconsistent with the statute.

165. Because the President grossly exceeded the bounds of his statutory authority by purporting to exempt stationary sources from standards for which the technology to implement is available and the exemptions do not further national security interests, the HON Proclamation is plainly in excess of the President's delegated powers and contrary to the statute's specific limitations on those powers. The President's action is contrary to the Clean Air Act and is ultra vires.

166. The Court possesses inherent equitable power to "grant injunctive relief . . . with respect to violations of federal law by federal officials." *Armstrong v. Exceptional Child Ctr., Inc.*, 575 U.S. 320, 326-27 (2015). Congress has nowhere foreclosed review of the interpretation and application of 42 U.S.C. § 7412(i)(4). There is no alternative statutory procedure for review of Plaintiffs' claim.

167. Because the Exemption Proclamation violates the Clean Air Act and is ultra vires, EPA actions implementing or giving effect to the proclamation likewise violate the Clean Air Act and are ultra vires.

COUNT TWO:
Ultra vires, de facto rulemaking without statutory authority
(Nonstatutory review of action in excess of statutory authority by federal officer; against all Defendants)

168. Plaintiffs incorporate by reference the allegations of Paragraphs 1-167.

169. Congress required EPA to provide for existing sources' compliance with hazardous air pollutant standards "as expeditiously as practicable," and set concrete boundaries on EPA's flexibility to set compliance deadlines "in no event later than 3 years after the effective date of such standard." 42 U.S.C. § 7412(i)(3)(A).

ED_021114D_00001944-00040

170. Congress gave EPA and state permitting authorities discrete, limited authority to grant an existing source "up to 1 additional year to comply" with standards promulgated under subsection (d) "if such additional period is necessary for the installation of controls." 42 U.S.C. § 7412(i)(3)(B).

171. Congress further conferred discrete, limited authority on EPA to stay the effectiveness of rules, including hazardous air pollutant standards, for no more than three months. 42 U.S.C. § 7607(d)(7)(B).

172. Congress directed EPA to provide for public notice and comment on EPA actions to revise hazardous air pollutant standards, their compliance dates, or to grant source-specific deadline extensions. 42 U.S.C. § 7607(d)(5), (h).

173. The exemption authority conveyed in Section 7412(i)(4) must be construed congruously with the authorities and limitations Congress enacted in Sections 7412 and 7607.

174. EPA and the President are bound by the Clean Air Act's duties with respect to implementing Section 7412(i)(4), following rulemaking procedures, and being bound by lawfully adopted regulations.

175. Reading Section 7412(i)(4) to authorize exemptions for a large swath of the regulated source category, from every single standard and other requirement of a rule, without facility- or standard-specific justification tied to the statutory factors, is contrary to the context, purpose, and structure of the Clean Air Act. The HON Proclamation's extremely broad sweep reflects an interpretation of the Section 7412(i)(4) authority that would swallow and render superfluous statutory limits.

176. The content, context, and scope of the HON Proclamation demonstrates that the Proclamation is not an "exemption" within the meaning of Section 7412(i)(4).

177. The HON Proclamation is functionally a rulemaking and/or stay pending reconsideration granted without observance of the procedural and substantive limitations Congress enacted in Section 7412 and 7607 of the Clean Air Act. The Proclamation was issued without observance of the statutory requirements for rulemaking or for granting a stay pending reconsideration.

178. EPA invited requests for presidential exemptions explicitly in the context of its announced reconsideration of the 2024 HON Rule and seven other hazardous air pollutant rules. *See* supra ¶¶ 53, 54. EPA has stated that the exemptions are offered "while EPA reconsiders" the underlying rule. *See* EPA, Clean Air Act Section 112 Presidential Exemption Information, https://perma.cc/NPT5-RAQY (last accessed Oct. 20, 2025).

179. The President indiscriminately granted exemptions from all compliance obligations of the 2024 HON Rule, without particularized consideration of the specific standards, technologies or practices needed to comply, or facilities and their particular products and processes, all of which is necessary to determine whether technology is not available to implement the standards and whether an exemption is in the national security interests of the United States.

180. The HON Proclamation's purported exercise of Section 7412(i)(4) exemption authority is in fact an exercise of rulemaking and/or stay authority despite the President lacking such power. The Clean Air Act gives only EPA that authority and only after following certain procedures in certain circumstances.

181. The sweeping HON Proclamation exceeds the narrow bounds of Section 7412(i)(4) to achieve improper goals prohibited by other provisions of the Clean Air Act. In granting compliance relief that far exceeds the Section 7412(i)(4) authority, the President

ED_021114D_00001944-00042

bypassed and contravened the statutory requirements on rulemaking and reconsideration to accomplish sweeping compliance exemptions unauthorized by law and in excess of the President's statutory authority.

182. The HON Proclamation is beyond the authority conveyed by the Clean Air Act and is *ultra vires*.

183. Because the HON Proclamation is beyond the Clean Air Act authority and ultra vires, EPA actions implementing or giving effect to the proclamation are similarly ultra vires.

RELIEF REQUESTED

WHEREFORE Plaintiffs request that the Court:

A. Declare that the HON Proclamation is unlawful and invalid and that the Annex I sources remain subject to the 2024 HON Rule as promulgated;

B. Issue injunctive relief:

i. prohibiting EPA and Administrator Lee Zeldin from implementing, relying on, or giving effect to the HON Proclamation, including through implementation of the Clean Air Act's Title V operating permit program; and

ii. directing EPA to promptly notify, in writing, the operators of facilities listed in Annex I and relevant state, local, and/or Tribal permitting authorities that the HON Proclamation is unlawful and invalid, and that any facilities that the HON Proclamation purported to exempt may not lawfully delay or avoid compliance with the deadlines promulgated by the 2024 Rule by relying on the HON Proclamation.

C. Awarding Plaintiffs their fees and costs of litigation as authorized by law;

D. Granting such other relief as the Court deems just and proper.

ED_021114D_00001944-00043

Office of Air and Radiation (OAR)
External Meeting Request Form

Please complete all fields in this form to schedule a meeting with EPA's OAR.

Today's Date: 1/16/20

Purpose

Purpose of the Meeting	To discuss the HON Rule, both the presidential exemption process and potential changes to the rule
Requesting Organization	Bracewell
Additional Organizations in Attendance (if applicable)	n/a

Background

Provide any background information the OAR scheduling team or meeting attendees should be aware of.

In the last year, have you met with anyone within EPA? If so, whom?	Bracewell regularly meets with EPA on behalf of our clients
Is this meeting related to ongoing litigation or an enforcement matter?	No
Additional Information	

Scheduling Point of Contact (POC)

Provide the information of who the OAR scheduling team should be in communication with.

Name	Holt Edwards
Email	holt.edwards@bracewell.com
Affiliation	Bracewell

Scheduling Information

Provide context for the urgency of this meeting.

Is the meeting urgent and if so, why?	The meeting is time senstive in that our clients are facing
Meeting Type	In-Person - EPA HQ
If in-person, are you traveling from outside the DC metro area? From where?	We are local to the DC metro area

ED_021114D_00002686-00001

Proposed Weeks for Meeting

Propose weeks that you would like to meet with OAR. These times are not guaranteed, and the OAR scheduling team will follow up with the above scheduling POC should this meeting request be granted.

Option 1	Week of: 1/19/26
Option 2	Week of: 1/26/26
Option 3	Week of: 2/2/26

EPA OAR Participants Requested

More information about OAR: https://www.epa.gov/aboutepa/about-office-air-and-radiation

Leadership

☐ **Szabo, Aaron:** Assistant Administrator

☑ **Tardif, Abigale:** Principal Deputy Assistant Administrator

OFFICE OF CIVIL ENFORCEMENT

WASHINGTON, D.C. 20460

Mr. Walter Tamukong
Program Director
Environmental Permitting and Regulatory
Cleveland-Cliffs Inc.
200 Public Square
Suite 3300
Cleveland, OH 41114

Via Electronic Mail: walter.tamukong@clevelandcliffs.com

Dear Mr. Tamukong:

I am writing to formally withdraw our June 10, 2025, letter regarding the US Environmental Protection Agency's (EPA) completeness determination seeking additional information related to Cleveland-Cliff's March 7, 2025, letter to Administrator Lee M. Zeldin. That letter requested extensions of various compliance dates pursuant to Clean Air Act §112(i)(3), 42 U.S.C. § 7412 (i)(3), for two National Emission Standards for Hazardous Air Pollutants subparts applicable to metallurgical coke manufacturing. You submitted the request on behalf of Cleveland-Cliffs, Inc. for three facilities: Cleveland-Cliffs Burns Harbor LLC in Indiana, Cleveland-Cliffs Cleveland Works LLC, Warren Location in Ohio, and Cleveland-Cliffs Monessen Coke LLC in Pennsylvania.

Since we issued the completeness determination seeking additional information, we have since been informed that the Office of Air and Radiation (OAR) has additional information relevant to the issue of a compliance extension. In light of this, it is appropriate to withdraw our letter in the interim while we coordinate with OAR and pending further developments. You are welcome to provide any additional information you think would be helpful. Please note that pursuant to 40 C.F.R. § 63.6(i)(4)(i)(B), "[n]onfrivolous requests [for compliance extensions] will stay the applicability of the rule…until such time as the request is granted or denied."

Sincerely,

[redacted]

Subject: March 7, 2025 Letter to EPA Administrator Zeldin re: Request for Extension of Compliance Dates

Dear Mr. Sanch,

Please see the attached in response to DTE Vantage's March 7, 2025, letter to Administrator Zeldin requesting extensions of various compliance dates pursuant to Clean Air Act §112(i)(3), 42 U.S.C. § 7412 (i)(3), for two National Emission Standards for Hazardous Air Pollutants (NESHAP) subparts applicable to metallurgical coke manufacturing.

If you have any questions regarding this letter, please contact [redacted] at [redacted] or [redacted]@epa.gov.

Regards,

[redacted]

Detroit, MI 48226

Via Electronic Mail: robert.sanch@dteenergy.com

Dear Mr. Sanch:

I am writing to formally withdraw our June 10, 2025, letter regarding the US Environmental Protection Agency's (EPA) completeness determination seeking additional information related to DTE Vantage's March 7, 2025, letter to Administrator Lee M. Zeldin. That letter requested extensions of various compliance dates pursuant to Clean Air Act §112(i)(3), 42 U.S.C. § 7412 (i)(3), for two National Emission Standards for Hazardous Air Pollutants subparts applicable to metallurgical coke manufacturing. You submitted the request on behalf of EES Coke, LLC for its facility located at Zug Island, Michigan.

Since we issued the completeness determination seeking additional information, we have since been informed that the Office of Air and Radiation (OAR) has additional information relevant to the issue of a compliance extension. In light of this, it is appropriate to withdraw our letter in the interim while we coordinate with OAR and pending further developments. You are welcome to provide any additional information you think would be helpful. Please note that pursuant to 40 C.F.R. § 63.6(i)(4)(i)(B), "[n]onfrivolous requests [for compliance extensions] will stay the applicability of the rule…until such time as the request is granted or denied."

Sincerely,

[redacted], Acting Director
Stationary Source Legal Branch

Subject: Application for Presidential Exemption for Cross Generating Station and Winyah Generating Station
Attachments: Application for Presidential Exemption for Cross Generating Station and Winyah Generating Station.pdf

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Mr. Szabo & Ms. Tardif,

Santee Cooper is submitting to EPA the attached application seeking a Presidential Exemption for its two coal-fired generating stations under section 112(i)(4) of the Clean Air Act. The application for a Presidential Exemption seeks a two-year extension of the MATS compliance deadlines for 8 coal-fired electric generating units located in South Carolina at the Cross Generating Station and the Winyah Generating Station, both of which are owned and operated by Santee Cooper. We acknowledge that President Trump signed on April 8 a Presidential Proclamation that provided MATS compliance extensions to many coal-fired generating units that had initially applied for the Presidential Exemption last March. However, it is our understanding that additional electric utilities will be afforded the same opportunity to apply for the Presidential Exemption through a second proclamation that would be issued in the near term. Santee Cooper requests that EPA include in this second proclamation the attached application requesting a Presidential Exemption for the Santee Cooper's Cross and Winyah Generating Stations.

Santee Cooper appreciates your attention on this important matter. Please contact me regarding any matters pertaining to Santee Cooper's application.

Thanks,

santee cooper

To: airaction@epa.gov

Re: Sterilizer Rule (89 FR 24090): International Sterilization Laboratory

I write on behalf of [International Sterilization Laboratory] to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

International Sterilization Laboratory requests that the Presidential Exemption apply to the following facilities regulated by the Sterilizer Rule and all sources therein:

- International Sterilization Laboratory, 217 Sampey Road, Groveland, Florida, 34736

International Sterilization Laboratory requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);

- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. [International Sterilization Laboratory] appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

Sincerely,

Steve Walter

EOSA The Ethylene Oxide Sterilization Association, Inc.
Managed by B&C® Consortia Management, L.L.C.

The Honorable Lee Zeldin
Administrator
Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Mail Code: 1101A

Dear Administrator Zeldin:

I write on behalf of the Ethylene Oxide Sterilization Association (EOSA) to ask EPA to take near-term action regarding the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24090 (Apr. 5, 2024), known as the "Sterilizer Rule." The Sterilizer Rule imposes extremely onerous ethylene oxide (EtO) emission standards on medical device sterilizers the most stringent of which must be met by April 2026—and is causing substantial harm to and regulatory uncertainty for EOSA's members.

EPA announced on March 12, 2025, that it will reconsider the Sterilizer Rule (alongside other NESHAPs), which is a welcome development. EOSA was also pleased to see EPA's statement that the Administration "is considering a 2-year compliance exemption via Section 112(i)(4) of the Clean Air Act for affected facilities while EPA goes through the rulemaking process." But medical device sterilizers need to decide *now* whether to expend substantial resources to acquire technology and reconfigure their facilities to try to comply with the Sterilizer Rule—or to instead cease operations. That, in turn, may disrupt the supply of critical medical devices, harming both patients and providers, or force medical providers to source those essential medical devices from abroad—increasing the offshoring of the sterilization of medical devices and inflating costs to Americans in direct contravention of the Trump administration's economic objectives.

The Sterilizer Rule was promulgated by the Biden administration under Clean Air Act ("CAA") Section 112 on April 5, 2024. The Sterilizer Rule includes standards set under Section 112(d), the CAA's hazardous pollutant "technology review" provision, and Section 112(f), the "risk review" provision, the latter of which the D.C. Circuit described as a "*one-time* 'risk review.'" *Nat'l Ass'n for Surface Finishing v. EPA*, 795 F.3d 1, 5 (D.C. Cir. 2015) (emphasis added). There are several major flaws in the Sterilizer Rule, and a litany of other issues and errors.

First, the Sterilizer Rule unlawfully set new standards under Section 112(f) even though EPA previously undertook the one-time risk review for this source category in 2006. 71 Fed. Reg. 17, 712, 17,716 (April 7, 2006). In doing so, EPA ignored the statutory text and context, both of which indicate that Congress intended EPA to regulate primarily through periodic technology reviews under Section 112(d) and conduct only one round of risk-based review under Section 112(f). By ignoring that Congressional mandate, EPA wrongly avoided Section 112(d)'s requirement that the agency must consider costs when setting and revising technology-based standards.

Second, the emission standards set in the Sterilizer Rule—particularly under Section 112(f), but also those set under Section 112(d) are extremely onerous, unsupported by the record data, and for some sterilizers will be impossible to meet. For example, EPA increased the standard for sterilization chamber vents using at least 30 tons per year ("tpy") of EtO from a 99% destruction

ED_021114D_00002974-00001

and removal efficiency (DRE) standard to a 99.99% DRE standard. This leaves no margin for error or equipment malfunction. Likewise, for aeration room vents ("ARVs") using at least 30 tpy of EtO, the Sterilizer Rule increased the DRE requirement from 99% to 99.9%, while wrongly rejecting commenters' request for an alternative standard. Both the SCV and ARV standards were premised on test data that EPA admitted, in the Proposed Rule, is not representative of normal operations. *See* 88 Fed. Reg. at 22,844. EPA also imposed stringent new standards on area sources; for example, EPA set a chamber exhaust vent emission standard of 99.9% DRE for facilities using at least 60 tpy of EtO. These are just a few of the stringent standards set in the Sterilizer Rule under Sections 112(f) and (d), all of which are unrealistic and unsupported by the record.

The Sterilizer Rule is also flawed because EPA arbitrarily and capriciously imposed onerous Continuous Emission Monitoring System (CEMS) mandates on facilities using at least 100 lb/year of EtO without proper notice and comment. Replacing parametric monitoring with CEMS, operating at fifteen-minutes intervals and demonstrating 90% data availability, is costly, complicated, and burdensome, while emission reduction benefits are minimal. Further, EPA failed to allow commenters to weigh in on the CEMS scheme the agency finalized, which requires application of CEMS *at each emissions inlet*, not just outlets. This CEMS scheme is thus both arbitrary and unlawful.

EOSA challenged the Sterilizer Rule in the United States Court of Appeals for the District of Columbia Circuit (No. 24-1180). In addition to raising the above major concerns, EOSA also explained that EPA wrongly set standards based on EtO *usage*, rather than based on EtO *emissions* (as the text of Section 112 requires); failed to establish technology-based standards under Section 112(d) before imposing certain of the risk-based standards; failed to consider and address comments on EPA's reliance on the flawed IRIS value for EtO; and failed to conduct rational cost/benefit analysis in deciding whether and to what extent to revise all standards. A fuller discussion of all of these issues can be found in EOSA's opening merits brief (Doc. #2080994).

As noted above, EPA has announced it will reconsider the Sterilizer Rule. EPA also recently moved to hold the litigation over the Sterilizer Rule in abeyance for 60 days "to allow new Agency leadership to review" the Sterilizer Rule and "to decide what action, if any, is necessary." *Cal. Cmtys. Against Toxics v. EPA*, No. 24-1178 (D.C. Cir. filed Feb. 18, 2025) (Doc. 2101209). EOSA appreciates EPA's recognition of the need to reconsider the Sterilizer Rule. But while EPA does so, EOSA's members continue to face the Sterilizer Rule's fast-approaching compliance deadlines: April 6, 2026, for standards set under Section 112(f) and April 5, 2027, for standards set under Section 112(d). These deadlines (particularly the former, which applies to the most stringent standards) require sterilizers to decide now whether to commit significant financial and operational resources—including to purchase new control technologies, redesign facilities, and restructure operations—to try to comply with the Sterilizer Rule, which is not possible for all facilities.

Lending further urgency to EPA's reconsideration of the Sterilizer Rule and the standards and deadlines set therein, the D.C. Circuit denied EPA's abeyance motion and the case has been set for argument on April 15, 2025. EOSA therefore urges EPA to act quickly to relieve sterilizers of the Sterilizer Rule's obligations, preventing unnecessary expenditures and irrevocable decisions that some sterilizers will likely be forced to make absent near-term relief.

To address the urgent compliance challenges posed by the Sterilizer Rule, EOSA identifies two potential pathways for relief. Ideally, EPA should pursue both to ensure that sterilizers can continue to operate in the near term, even while EPA reconsiders the Sterilizer Rule more broadly.

Path 1: Presidential Waiver under Section 112(i)(4)

As suggested by EPA, the President should exercise his authority under CAA § 112(i)(4) to grant a two-year compliance exemption commencing on the Sterilizer Rule's compliance deadlines: April 6, 2026, for risk-based standards and April 5, 2027, for technology-based standards. The President may grant such an exemption for all sources regulated by the Sterilizer Rule in one action,[1] based upon findings that (1) "it is in the national security interests … to do so" and (2) "the technology to implement such standard is not available." 42 U.S.C. § 7412(i)(4).

The first requirement—national security interests—is satisfied due to the critical role that sterilization facilities play in maintaining the U.S. medical device supply chain. Compliance with the Sterilizer Rule's deadlines, particularly the two-year deadline for compliance with the risk-based standards set under Section 112(f), will significantly reduce sterilization capacity. This, in turn, will lead to severe shortages of life-critical medical devices such as catheters, surgical kits, syringes, bandages, IV equipment, and needles, disrupting essential healthcare services. EOSA cautioned in its Comments on the Proposed Sterilizer Rule that the loss of capacity while facility reconstruction and modifications are underway will cause "a large reduction in medical device sterilization capacity and a severe shortage of sterilized medical devices." EOSA Comments 59, EPA-HQ-OAR-2019-0178-0618. Medical industry stakeholders similarly noted that modifying sterilization equipment is "no trivial matter":

> These complex facilities, no two of which share the same design or process, typically must go at least partially offline to make modifications to the equipment. Even routine maintenance or periodic upgrades require significant planning to minimize downtime across the monthly or annual supply cycle.

Advanced Medical Technology Association Comments 9–10, EPA-HQ-OAR-2019-0178-0601.

Without relief, sterilizers may be unable to meet demand for sterilized medical devices, leading to shortages that force medical providers to seek alternative sources abroad and increase the United States' dependence on foreign suppliers for essential medical devices. This growing reliance on foreign sterilization capacity and imported medical equipment poses an immediate national security risk, as any disruption—whether from geopolitical conflicts, trade restrictions, or economic coercion—could severely limit the United States' ability to maintain an independent and resilient healthcare system, jeopardizing timely access to life-saving medical equipment.

[1] Nothing in Section 112(i)(4) bars the President from issuing an exemption that applies to all regulated sources—and the President should do so here to ensure that all sterilization facilities are relieved from the obligation to comply with the Sterilizer Rule.

The second requirement technology unavailability is also met. It will be impossible for all regulated sources to obtain and install necessary control technology by April 2026 due to the limited number of equipment manufacturers and workforce shortages.

EOSA has explained that many of the Sterilizer Rule's requirements "require significant facility reconstruction and major equipment procurement and installation" that could take years—particularly if all sterilizers must redesign their facilities and install equipment to meet the new standards at the same time. EOSA Comments 58 59. And "[t]he availability of the equipment, materials, and contractor services necessary to modify emission control systems is severely limited." Sterigenics Comments 28, EPA-HQ-OAR-2019-0178-0632. Between supply chain constraints, the time-intensive process of facility redesign to accommodate new equipment, and the extensive testing and validation required before any system can become operational, the necessary control technology is functionally unavailable within the required timeframes.

Further, even if it were possible for all facilities to secure the needed equipment and make the necessary design and structural changes within the current compliance periods, the limited number of experienced installation professionals and technical experts who support this industry makes timely compliance by all regulated sources logistically infeasible. *See* AdvaMed Comments at 10. There is simply no way that all regulated sources will be able to obtain both the necessary equipment *and* the skilled technicians needed to successfully install, test, and bring that equipment online within the same two-year period, as required under the Sterilizer Rule.

Finally, control device manufacturers cannot guarantee that their equipment will operate to meet the Sterilizer Rule's stringent performance deadlines. *See* Sterigenics Comments at 28. This further highlights the technological infeasibility of meeting the current compliance deadlines as well as the irrationality and infeasibility of the standards themselves. This is a particularly compelling basis for the President to find that "the technology to implement such standard is not available," 42 U.S.C. § 7412(i)(4), and grant a two-year waiver.

Even the Biden Administration recognized the compliance challenges posed by the Sterilizer Rule. In its *Memorandum on the Orderly Implementation of the Air Toxics Standards for Ethylene Oxide Commercial Sterilizers* (Jan. 16, 2025), the Administration acknowledged that waivers or exemptions may be necessary to "achiev[ing] the … Rule's critical health protections as soon as practicable, while safeguarding the supply of safe medical products from disruption that would compromise the health and welfare of the American people."

EPA should therefore urge President Trump to exercise his authority under Section 112(i)(4) and quickly issue a two-year compliance exemption for all sources regulated under the Sterilizer Rule, effective when each set of standards set therein would otherwise apply. The exemptions then may be extended for one or more additional periods, if necessary.

Path 2: EPA Rulemaking to Stay or Extend Deadlines

Also or alternatively, EPA should take a near-term discrete administrative action to rescind the Rule 112(f) risk-based standards, or at least stay the compliance deadlines, based on a finding that the standards are likely unlawful and EPA's stated commitment to reconsider the Sterilizer Rule.

Because Section 112(f) allows EPA to grant no more than two years for compliance with risk-based standards (although, as discussed above, the President may issue a further two-year exemption—and should do so here), EPA should take near-term, discrete administrative action to rescind at least the risk-based standards set in the Sterilizer Rule based on a finding that its reliance on Section 112(f) to revise EtO emission standards was unlawful. EPA has a solid basis for taking that initial step now: under the Biden Administration, EPA ignored the statutory text and context, both of which confirm that the risk-review is (as the D.C. Circuit previously stated), a "one-time" event, and therefore EPA's conduct of a second risk review was unlawful.

Alternatively, EPA could take a discrete administrative action to stay the Sterilizer Rule's compliance deadlines (ideally for all standards, but at least the Section 112(f) risk-based standards) pending completion of reconsideration and a new notice-and-comment rulemaking process to rescind, replace, or revise the Sterilizer Rule. Such action would relieve sterilizers of near-term compliance obligations and reduce the risk that many sterilizers will cease operations and thereby disrupt the supply of medical devices even while EPA is reconsidering the Sterilizer Rule.

Because the Sterilizer Rule is the result of a notice-and-comment rulemaking process, rescinding or revising the Sterilizer Rule or even just staying the compliance deadlines likely also requires rulemaking to minimize the chance that a reviewing court vacates such action. But EPA could invoke the Administrative Procedure Act's "good cause" exception to notice and comment because the key legal issue whether EPA can conduct a second round of risk review for a source category has already been subject to a notice-and-comment process, and it is a pure statutory construction question on which EPA can correct course now. Further notice-and-comment on that issue is thus "unnecessary," and it is also "impracticable" and "contrary to the public interest" given the urgency of the issue and the impact on the medical device supply chain. *See* 5 U.S.C. 553(b)(B). Or, EPA could issue an interim final rule rescinding at least the Section 112(f) standards and thereby obviating the nearest-term compliance deadlines. This option would allow further notice and comment, but still provide immediate relief for sterilizers facing the difficult choice whether to try to comply with the Sterilizer Rule despite the near-impossibility of doing so or cease operations and disrupt the domestic medical supply chain.

* * * *

EOSA appreciates EPA's commitment to reconsidering the Sterilizer Rule and addressing the concerns of regulated facilities. EOSA also appreciates the Agency's willingness to consider near-term actions, such as a Presidential exemption and/or discrete administrative action to address the Section 112(f) standards and associated compliance deadlines. As many facilities confront immediate investment decisions, regulatory clarity is essential. EOSA urges EPA to take timely action to ensure that sterilization facilities remain operational while advancing long-term regulatory solutions that balance public health objectives with industry feasibility.

Thank you for your consideration. Please feel free to contact me at mzhuang@bc-cm.com if you have any questions regarding this request.

Sincerely,

Meibao Zhuang

Re: Subject: Presidential Exemption: Ethylene Oxide Emissions Standards for Sterilization Facilities: Trinity Sterile, Inc.

Dear Sirs:

On behalf of Trinity Sterile, Inc. (Trinity), we respectfully request a two-year exemption from compliance with the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Commercial Sterilizers (40 CFR Part 63, Subpart O) under Section 112(i)(4) of the Clean Air Act. Information supporting this request is provided below.

Emissions Standards or Limitations Subject to the Request:

- "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" (89 FR 24090; April 5, 2024) (Sterilizer Rule)

Facility and Affected Sources:

- Facility Name: Trinity Sterile, Inc.
- Facility Address: 201 Kiley Drive, Salisbury, MD 21801
- Permit Number: 045-0139
- AIRS ID: 1506
- Affected Sources:
  - Sterilization chamber vent
  - Two aeration room vents

Length of Compliance Period Being Requested:

- A two-year exemption, effective as of the compliance date of April 6, 2026, and extending through April 6, 2028.

Justification for the Request:

1. **Technology Unavailability:**
   - The revised NESHAP requires the implementation of a permanent total enclosure (PTE) to capture all fugitive emissions. Most facilities, including Trinity's Salisbury facility, were not initially designed to implement PTE and will require substantial redesign to comply. This redesign process is technologically complex and will vary for each facility; Trinity estimates the process at its facility—including re-

permitting—will necessitate the reconfiguration of an 12,000 square foot warehouse space. As this work cannot be completed before the April 2026 deadline, Trinity will have to shut down its operations after that date while these upgrades are completed. Details regarding the impact that this disruption will have on Trinity's sterilization operation is detailed below.

- There is also a scarcity of engineers and consultants capable of this type of work within the short time frame permitted under the current rule. It is also unknown what technology EPA will recommend after it reconsiders this rule. Therefore, it cannot be determined at this point whether that technology is currently available for this facility.
- Finally, the medical devices that Trinity assembles must be sterilized according to specific protocols and can only be sterilized at Trinity's Salisbury facility. Outsourcing sterilization would take more than twelve months and may be impossible, as all other facilities capable of sterilizing Trinity's products are at capacity. Likewise, there is no guarantee that there will be capacity at other sterilizers for Trinity's products after the rule's implementation.

2. **National Security Interests:**
   - Trinity manufactures critical medical devices that are essential for patient care across the United States. These devices are distributed to over 4,000 institutions, including hospitals, homecare facilities and military bases. Any interruption in sterilization operations due to this rule's implementation could result in severe disruptions to the supply of these devices. Trinity estimates that it manufactures and distributes nearly 25,000,000 medical kits a year, as well as over an additional 6,000,000 surgical instruments. Trinity will likely have to shut-down sterilization operations for at least year in order to implement PTE. For that year, those 25,000,000 kits and 6,000,000 instruments will not be available to the care providers that need them to perform necessary procedures on millions of patients. Ensuring the continuous availability of sterilized medical devices is vital for national health security and public safety.
   - Without this exemption, Trinity may be forced to permanently shut down its onsite sterilizer, or even stop manufacturing operations completely due to the lack of available sterilizer capacity at other facilities and the lengthy process of establishing sterilization protocols and completing validation. Trinity also provides assembly and manufacturing services for other entities, and these delays would also impact those entities, likely forcing them to go out-of-business entirely. Granting this exemption is also in the national security interests of the United States, as it will avoid any unnecessary delays if these standards change after the EPA reconsiders this rule.

An appropriate delegation of authority by Trinity to submit this request is enclosed. Trinity reserves the right to amend this application based on any subsequent guidance, rulemaking, or change in law.

We look forward to your favorable consideration of this request.

Respectfully submitted,

Bryan Michael Allen

RE: Delegation of Authority to Faegre Drinker for Section Clean Air Act Exemption Request

To Whom It May Concern,

This letter confirms that Trinity Sterile, Inc. has authorized Bryan Michael Allen of Faegre Drinker Biddle & Reath LLP to submit a request for a 2-year Presidential Exemption under Section 112(i)(4) of the Clean Air Act on its behalf. Bryan Michael Allen is fully empowered to communicate with the EPA and provide any necessary documentation related to this request.

Sincerely,

Abrar Solatch

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Dear EPA,

Please find attached a formal request on behalf of Trinity Sterile, Inc. for a two-year exemption from the Ethylene Oxide Emissions Standards for Sterilization Facilities, as outlined in Section 112(i)(4) of the Clean Air Act.

Facility Information:

- Facility Name: Trinity Sterile, Inc.
- Facility Address: 201 Kiley Drive, Salisbury, MD 21801

Emissions Standards or Limitations Subject to the Request:

- "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review", 40 CFR Part 63, Subpart O (89 FR 24090; April 5, 2024) (Sterilizer Rule)

Length of Compliance Period Being Requested:

- 2 year exemption from April 6, 2026, to April 6, 2028.

The attached request includes justifications based on the unavailability of required technology and the national security interests of the United States, and an appropriate delegation of authority from Trinity to submit this request on their behalf. The attached letter does not include any proprietary information. However, such information may be available if deemed necessary by the EPA, which can be submitted in accordance with applicable rules and regulations to protect confidential business information.

Please do not hesitate to contact us if you require any additional information or steps to process this request.

Kind regards,

Bryan M. Allen

Subject: Presidential Exemption: Ethylene Oxide Emissions Standards for Sterilization Facilities: LivaNova USA, Inc.

Dear Sirs:

On behalf of LivaNova USA, Inc. (LivaNova), we respectfully request a two-year exemption from compliance with the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Commercial Sterilizers (40 CFR Part 63, Subpart O) under Section 112(i)(4) of the Clean Air Act. Information supporting this request is provided below.

Emissions Standards or Limitations Subject to the Request:

- "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" (89 FR 24090; April 5, 2024) (Sterilizer Rule)

Facility and Affected Sources:

- Facility Name: LivaNova Arvada Facility
- Facility Address: 14401 W 65th Way, Arvada, CO 80004
- Permit Number: 99JE0094
- AIRS ID: 059-1258
- Affected Sources:
  - Sterilization chamber vent
  - Aeration room vent
  - Chamber exhaust vent
  - Group 1 room air emissions (indoor EtO storage, EtO dispensing, vacuum pump operation)
  - Group 2 room air emissions (post-aeration handling of sterilized material)

Length of Compliance Period Being Requested:

- A two-year exemption, effective as of the compliance date of April 6, 2026, and extending through April 6, 2028.[1]

[1] LivaNova's compliance date for the Group 1 room air emissions affected source is April 5, 2027. LivaNova only requests a one-year exemption for the Group 1 room air emissions affected source, through April 6, 2028 to align with the other requested deadlines for this facility.

Justification for the Request:

1. **Technology Unavailability**:
    - The revised NESHAP requires the implementation of a permanent total enclosure (PTE) to capture all fugitive emissions. Most facilities, including LivaNova's Arvada facility, were not initially designed to implement PTE and will require substantial redesign to comply. This redesign process is technologically complex and will vary for each facility. Construction will likely be ongoing for six months or more. LivaNova also estimates that implementing PTE will result in a shut-down of its sterilization operations for six weeks or more, leaving at least an estimated 10,000 heart surgery patients without access to the care they need, that is dependent on LivaNova's sterilized medical devices.
    - There is also a scarcity of engineers and consultants capable of this type of work within the short time frame permitted under the current rule.
    - It is also unknown what the EPA will recommend or require of facilities with Ethylene Oxide sterilization operations after it reconsiders the Sterilizer Rule. Therefore, it cannot be determined at this point whether technology is currently available for this facility or whether proceeding with a technology implementation will meet the requirements that result from the EPA's reconsideration.

2. **National Security Interests**:
    - LivaNova is the only company that is domestically manufacturing and sterilizing heart surgery packs used in United States bypass surgeries. Any interruption in sterilization operations due to non-compliance could result in severe disruptions to the supply of these devices. For example, LivaNova's medical devices are used in at least 85,000 critical heart surgeries a year, and any interruption in sterilization operations would jeopardize those surgeries. Likewise, without this exemption, those 85,000 heart surgery patients are expected to be faced with increased costs for the implementation of technology that may otherwise not be needed. Ensuring the continuous availability of sterilized medical devices is vital for national health security and public safety.
    - Without this exemption, LivaNova may need to either reduce its operations or outsource its sterilization to other facilities, which could lead to further delays in providing its products for surgeries. Granting this exemption is also in the national security interests of the United States, as it will avoid any unnecessary delays if these standards change after the EPA reconsiders this rule.

Additional information supporting this request is provided in our letter to the USEPA Office of Air and Radiation dated February 21, 2025, which is incorporated by reference. We believe that granting this exemption aligns with the national security interests of the United States without compromising public health and safety.

An appropriate delegation of authority by LivaNova to submit this request is enclosed. LivaNova reserve the right to amend this application based on any subsequent guidance, rulemaking, or change in law.

We look forward to your favorable consideration of this request.

Respectfully submitted,

Bryan Michael Allen

The Honorable Lee M. Zeldin
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW,
Washington, DC 20460

Re: Presidential Exemption:

National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Commercial Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24090 (April 5, 2024) (40 CFR Part 63, Subpart O):

- **Covidien North Haven Facility, 195 McDermott Road, North Haven, Connecticut**

Dear Administrator Zeldin:

Covidien LP ("Covidien") hereby submits the following request for Presidential Exemption from the final risk and technology review of the National Emission Standards for Hazardous Air Pollutants ("NESHAP") for the commercial ethylene oxide ("EtO") sterilization source category, 40 CFR Part 63, Subpart O ("Sterilizer Rule"), published in the Federal Register on April 5, 2024.[1] On March 12, 2025, the U.S. Environmental Protection Agency ("EPA") announced the "Powering the Great American Comeback Initiative" to, among other actions, reconsider the Sterilizer Rule and other standards affecting a broad range of American industrial sectors. The enclosed request is submitted in accordance with EPA's instruction to submit requests for Presidential Exemptions from the Sterilizer Rule by March 31, 2025.[2]

I. Request for Presidential Exemption

Covidien has determined that its medical device manufacturing and sterilization facility located at 195 McDermott Road, North Haven, Connecticut ("North Haven Facility" or "Facility") cannot implement certain requirements of the Sterilizer Rule before the applicable compliance date. Specifically, it is *technologically infeasible* to install the Facility upgrades needed to operate a Permanent Total Enclosure ("PTE") for all Group 2 room air emissions (as defined in the Sterilizer Rule) prior to April 6, 2026. If the North Haven Facility is forced to halt sterilization operations on the compliance date, there is no available alternative to safely sterilize the essential medical products manufactured by Covidien. Therefore, a disruption to the sterilization operations

[1] 89 Fed. Reg. 24090 (Apr. 5, 2024).

195 McDermott Road
North Haven, CT 06473

COVIDIEN

of the North Haven Facility would adversely affect the United States' *national security interest* in a safe and reliable domestic supply of sterile medical products.

In accordance with Section 112(i)(4) of the Clean Air Act, Covidien requests a Presidential Exemption to extend the North Haven Facility's deadline to comply with all standards for Group 2 room air emissions under the Sterilizer Rule for ***two years until April 5, 2028***.

A. Background

The Covidien North Haven Facility is a finished goods manufacturing and assembly plant for Class I, II, and III medical devices, primarily to serve the surgical market.[3] The majority of products produced at the North Haven Facility undergo EtO sterilization as part of the standard manufacturing process. A proportion of products are made from bio-absorbable materials or contain bio-absorbable materials that are sensitive to moisture and other outside elements. Those products that are absorbable in nature, or that contain absorbable elements, are sterilized on-site to ensure product performance and shelf life. As described further below, these products require additional post-sterilization processing and packaging on-site in the North Haven Facility before being distributed for sale.

Products manufactured and EtO sterilized at the North Haven Facility include:

Product	Description	EtO Sterilized On-Site	Post-Aeration Processing On-Site
V-Loc™ Wound Closure Device	Barbed sutures, absorbable and non-absorbable	X	X
Polysorb™ Braided Absorbable Suture	Braided absorbable suture	X	X
AbsorbaTack™ Fixation Device	Absorbable tack fixation device for laparoscopic hernia repair	X	X

[3] The U.S. Food and Drug Administration ("FDA") requires medical devices to be classified based on the risk posed to a patient associated with the intended use or specialized indications for use of a device. Class I includes devices with the lowest risk and Class III includes those with the greatest risk.

Lapro-Clip™ Absorbable Clips	Absorbable ligation clips	X	X
Premium Poly CS™ Stapler	Absorbable open stapler	X	X

The North Haven Facility currently operates two sterilization systems, each consisting of a sterilization chamber, and a primary aeration room. Secondary aeration rooms are also available and can be shared by both systems. The two sterilizer systems are currently permitted by the Connecticut Department of Energy and Environmental Protection ("CTDEEP") under state New Source Review ("NSR") Permit Nos. 135-0143 & 135-0144. NSR Permit No. 135-0143 covers Sterilizer No. ST-A, and NSR Permit No. 135-0144 covers Sterilizer No. ST-B. Medical devices manufactured onsite are sterilized using a mixture of EtO, nitrogen, and steam. Sterilized product is then aerated. All exhausts and vents from both systems, including the sterilization chambers, primary aeration, and secondary aeration are ducted to a single stack equipped with a balancer and catalytic oxidizer.

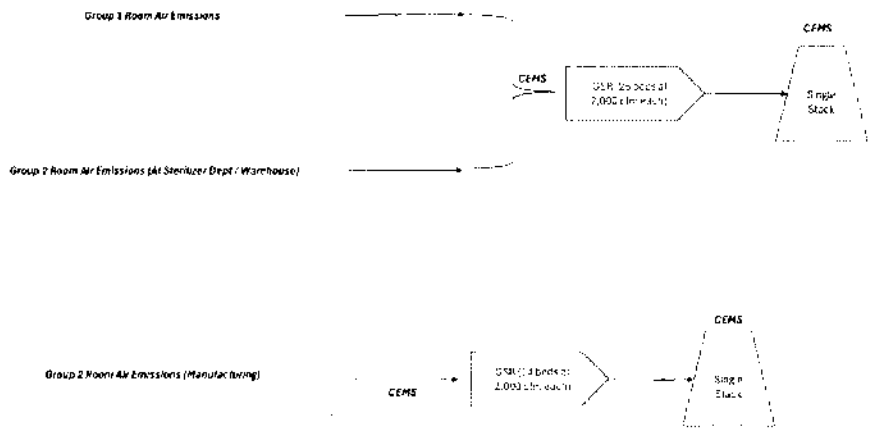
195 McDermott Road
North Haven, CT 06473

COVIDIEN

B. The technology needed for the North Haven Facility to comply with Group 2 room air emission control requirements is not available prior to the applicable compliance date

The Sterilizer Rule requires the North Haven Facility identify a compliance approach, design physical modifications, procure control technologies, and complete construction of Facility upgrades to comply with new emission standards applicable to Sterilization Chamber Vents ("SCVs"), Aeration Room Vents ("ARVs"), Chamber Exhaust Vents ("CEVs"), and Group 1 and Group 2 room air emissions.[4] Group 1 room air emissions apply to "emissions from indoor EtO storage, EtO dispensing, vacuum pump operations, and pre-aeration handling of sterilized material."[5] Group 2 room air emissions apply to "emissions from . . . the storage and transportation of material that has been removed from aeration but has not been placed in a vehicle for the sole purpose of distribution to another facility."[6] Covidien plans to install PTEs for all areas within the North Haven Facility identified as containing Group 1 and Group 2 room air emissions, two banks of dry resin bed control device systems with at least 80% DRE, and new stacks associated with the two dry bed systems. The North Haven Facility is currently permitted for a combined EtO throughput of greater than 4 tons per year (tpy) and, therefore, must comply with Group 2 emission standards promulgated under Clean Air Act Section 112(f)(2) by April 6, 2026.

Below is a representative process flow diagram of the planned system for controlling Group 1 or Group 2 room air emissions:



[4] This request for Presidential Exemption does not seek an extension of time to comply with the standards for SCVs, CEVs, or ARVs under the Sterilizer Rule.
[5] 40 CFR 63.361
[6] *Id.*

Docusign Envelope ID: 9C57DD98-A887-464A-8ABD-8CB59CCF8D9E

195 McDermott Road
North Haven, CT 06473

COVIDIEN

North Haven Facility Group 1 and Group 2 Planned Process Flow Diagram

The Group 1 room air emissions routed to the first dry resin bed system comprise EtO storage, dispensing, vacuum pump operations, and pre-aeration handling of sterilized material consistent with the scope of Group 1 emission sources defined under the Sterilizer Rule. The Group 2 room air emissions (sterilizer department / warehouse operations) routed to this system comprise post aeration handling of sterilized product prepared for additional processing onsite or for shipment off site. In addition, Group 2 room air emissions (manufacturing) routed to the second dry resin bed system comprise post-aeration processing operations for bioabsorbable sutures manufactured at the North Haven Facility. These operations occur in several different areas of the Facility, including dry rooms with various processes designed to remove moisture from the suture products and maintain dry conditions prior to final packaging for distribution.

Covidien has determined that it is *technologically infeasible* to design and install PTEs for Group 2 room air emissions within the extremely short compliance deadline of April 6, 2026 finalized by EPA in the Sterilizer Rule. Several engineering challenges at the North Haven Facility make the compliance deadline for controlling Group 2 room air emissions technologically infeasible.

First, manufacturing areas used to process post-aeration sterilized material include distinct room areas that are physically disconnected and located on separate floors. The hallways, elevator and other corridors connecting all Group 2 areas cannot be contained within a single PTE due to physical separation, adjoining hallways and spaces, varying ceiling heights, and utilities located through these spaces. Multiple air locks or vestibules would be needed to control air flow from one or more PTEs. Further, as a combined manufacturing and sterilization Facility, the building includes numerous operations adjacent to or surrounding Group 2 areas that do not handle post-

ED_021114D_00002981-00005

Docusign Envelope ID: 9C57DD98-A887-464A-8ABD-8CB59CCF8D9E

aeration sterilized material. Several such areas require clean room environments and/or dry room environments with positive air pressure gradients that are inconsistent with the design of a PTE. As a consequence, a PTE for the Group 2 areas must include numerous Natural Draft Openings ("NDOs") to common hallways or other areas of the North Haven Facility. The engineering challenges associated with designing a PTE for this facility make the April 6, 2026 compliance deadline infeasible.

Second, maintaining negative air pressure through the substantial volume of duct work that would be needed for a PTE will be highly energy *inefficient*. It is anticipated that the North Haven Facility will need to substantially redesign its heating and cooling systems to facilitate the necessary air pressure gradient and large volume of air exhausted from the building.

Third, Covidien's bioabsorbable suture products require post-aeration drying to remove moisture from steam used during the sterilization process. Group 2 areas that include dry rooms must be maintained at positive air pressure to remove moisture for product quality purposes. Therefore, EPA Method 204 was developed for single-room or facility-wide operations that are not readily transferrable to the North Haven Facility's combination medical device manufacturing and sterilization operations. Covidien specifically raised these serious concerns in comments responding to EPA's proposed revisions to the Sterilizer Rule, explaining:

> PTEs are not feasible for sterilizers located at medical device manufacturing plants in light of the dual nature of the activities being conducted at such facilities. PTEs would require that sterilization and manufacturing operations within the same facility to be kept under negative and positive pressure environments, respectively. This arrangement would potentially require significant changes to the overall ventilation system, which would be infeasible to implement within a single facility (depending upon the individual facility configuration). It may also disrupt or prevent certain manufacturing operations that require clean room environments with air pressure gradients that are inconsistent with the design of a PTE.[7]

In summary, the North Haven Facility faces specialized challenges to complying with the Group 2 emissions requirements because of the products manufactured and sterilized at this Facility. As a result, Covidien has determined that that it is technologically infeasible to design the physical modifications, amend NSR Permit Nos. 135-0143 and 135-0144, procure necessary control equipment, complete construction, and conduct initial performance tests prior to the April 6, 2026 to control Group 2 room air emissions. *See* 42 U.S.C. § 7412(i)(4) ("the President may

[7] EPA-HQ-OAR-2019-0178-0577 (comment submitted by Covidien's corporate parent, Medtronic Inc.).

COVIDIEN

exempt any stationary source from compliance with any [NESHAP] standard or limitation . . . if the President determines that ***the technology to implement such standard is not available*** . . .").

C. Any disruption or temporary pause to the supply of essential products manufactured by the North Haven Facility will threaten patient health and safety and, therefore, national security

The U.S. government has recognized that medical device manufacturing and sterilization operations are vital to domestic critical infrastructure. Incapacitation or disruption to these operations would have a debilitating effect on national security, economic security, public health and safety, or any combination thereof. Indeed, the U.S. Department of Homeland Security, Cybersecurity and Infrastructure Agency ("CISA") has determined:

> The Healthcare and Public Health Sector protects all sectors of the economy from hazards such as terrorism, infectious disease outbreaks, and natural disasters. Because the vast majority of the sector's assets are privately owned and operated, collaboration and information sharing between the public and private sectors is essential to increasing resilience of the nation's Healthcare and Public Health critical infrastructure.[8]

A reliable supply of sterile medical devices and equipment sterilized using EtO—such as sutures, surgical kits, IV sets, and other equipment—is critical to the United States' national security interests' because these products are subject to highly inelastic demand. There are nearly 6,100 hospitals in the United States which admit more than 34.4 million patients annually.[9] Medical devices and equipment respond to "on demand" and unpredictable healthcare needs. Any disruption to the supply of medical devices roughly 50% of which are sterilized using EtO[10] would adversely affect patient care. Healthcare associated infections are also a major public health concern in the United States and worldwide. In the United States alone, it is estimated that 1 in 31 patients (more than 1 million patients per year) experience healthcare associated infections.[11] Along with infection control practices, effective sterilization of medical devices and instruments is essential to minimize the risk of healthcare associated infections.

195 McDermott Road
North Haven, CT 06473

COVIDIEN

The bioabsorbable sutures manufactured by Covidien provide lifesaving medical care to patients throughout the United States. If Covidien is forced to halt or terminate sterilization operations at the North Haven Facility, the resulting disruption to domestic supply of bioabsorbable sutures would adversely impact the public health critical infrastructure of the United States. Moreover, if Covidien cannot continue to conduct sterilization operations in America, it may be forced to seek manufacturing and/or sterilization capacity outside the United States. Reliance on imported medical equipment poses a *national security risk* because disruption due to geopolitical conflicts, trade restrictions, economic coercion, or other factors could severely limit the resilience of United States' healthcare system. Therefore, the requested exemption is in the national security interests of the United States. *See* 42 U.S.C. § 7412(i)(4) ("the President may exempt any stationary source from compliance with any [NESHAP] standard or limitation . . . if the President determines that . . . ***it is in the national security interests of the United States to do so***. . .").

II. Conclusion

For the reasons explained herein, Covidien respectfully requests a Presidential Exemption to extend the compliance deadline to comply with all standards for Group 2 room air emissions at the North Haven Facility. Subject to EPA's reconsideration of the Sterilizer Rule, Covidien seeks a two-year exemption until April 5, 2028.

We would be pleased to address any questions regarding this request for Presidential Exemption. Please direct any inquiries to my attention at thomas.l.osteraas@medtronic.com.

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To whom it may concern,

We are requesting a Presidential Exemption for Ethylene Oxide Emissions Standards for Sterilization Facilities: **National Emission Standards for Hazardous Air Pollutants (NESHAP)**.

This would be for our ETO sterilizing facility: Long Island Sterilization.

Long Island Sterilization has common ownership with our medical device manufacturing company, Robert Busse & Co. dba Busse Hospital Disposables.

Busse Hospital Disposables (Busse) is a small woman owned company located in the Hauppauge Industrial Park located in Hauppauge, NY. our facilities are located two blocks from each other.

Busse Hospital Disposables is in direct control of Long Island Sterilization (LIS) , we have been sterilizing medical devices for over 26 years.

We are currently operating under a permit from the New York DEC. We have applied for an extension for our permit to take us into next year.

We are currently in full compliance with NYS DEC regulations but will need to start upgrading our sterilization facility to be incompliance with the NESHAP rules.

Busse Hospital Disposables & LIS injection mold, assemble, package and sterilize over 18 million medical products / yr.

Busse has been in operation as a manufacturer for over 45 years and in business for over 60 years.

We currently have 260 full time employees.

Our products are used throughout the entire healthcare spectrum from Hospitals to

Ambulatory Centers, Doctors offices and nursing homes

We currently have a Federal Supply Schedule contract with VA Health system.

Most of the sales of our products are done through our distributors such as Cardinal Health, Medline Industries, Henry Schein, McKesson Medical, Owens & Minor and over 100 local and regional distributors.

We also export our medical devices overseas.

Along with a full line of single use, procedural kits & trays, surgical drapes and OR suction products under the Busse brand, we also manufacture private branded products for many well known companies in the US.

We also manufacture OEM parts to other medical device manufacturers for use in their sterile procedural kits, trays & surgical packs.

We are requesting a period of at least two years to become compliant with the new NESHAP regulations. We are asking this because:

1. We feel the necessary upgrades to our existing equipment along with new construction in our facility will be quite costly for our company.
2. There will also be a required purchase of additional monitoring equipment. This will be a very large capital expense for us and most be done in stages for cash flow as well as staying in successful day to day operation as a business. The technology exists but is not inexpensive.

One of the bullet points you ask us to include was explanation as to why this extension "is in the national security interest of the United States".

I believe the best we can say is simply that we manufacture and sell at an average over 18 million sterile medical devices annually. 98% are sold to be used in the United Sates.

Lastly, many of our products are used during lifesaving surgeries as well as being used in the normal Emergency Room's and physician's offices throughout the United States.

I hope that we have answered your questions to your satisfaction and hope you can help us by including us in this program.

If you need any additional information or would like to visit our two facilities just let me know.

Sincerely,

Ray

Ray O'Hara

RE: Presidential Exemption: National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" (89 FR 24090; April 5, 2024) (Sterilizer Rule)

To whom it may concern:

Elite Spice, Inc. appreciates the opportunity to submit a request for a Presidential Exemption under section 112(i)(4) of the Clean Air Act for the National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" (89 FR 24090; April 5, 2024) (Sterilizer Rule).

Elite Spice, Inc. is a privately-held, American-owned spice and seasoning manufacturer headquartered in Jessup, Maryland. With over 35 years of experience in processing spices for the food industry, we are committed to maintaining the highest standards of food safety. Our mission is to supply pure, safe, and wholesome spices to the commercial food manufacturing industry.

Emissions standards or limitations subject to the request: National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" (89 FR 24090; April 5, 2024) (Sterilizer Rule)

Facilities and affected sources: Elite Spice operates three facilities – two in Maryland and one in Nevada—where we utilize ethylene oxide to sterilize spices, ensuring their safety and quality for our customers.

Length of compliance period requested: Elite Spice respectfully requests an extension of 24 months beyond the original compliance deadline of April 5, 2026.

Justification as to why the technology to implement the standard is not available: The NESHAP proposes several actions that are either infeasible to implement or require a complete restructuring of current spice manufacturers' operations. Regardless, the 18-month timeframe the

ED_021114D_00002987-00001

EPA originally proposed is insufficient to implement the changes needed to comply with the NESHAP. The NESHAP effectively forces the spice industry to cease using EO at the end of the implementation period. Additionally, several spice sterilizers have already left the industry due to these challenges.

These concerns are echoed in the comments submitted by the U.S. Office of Advocacy of the Small Business Administration (NESHAP Dock ID No. EPA-HQ-OPP-20130244 & Docket ID No. EPA-HQ-OAR-2019-0178). Specifically, issues have been raised regarding the unreasonable compliance period, the challenges posed by overlapping compliance regulations with the PID, and the difficulties associated with retrofitting facilities to accommodate total enclosures.

While not classified as a small business, we at Elite Spice handle spice sterilization as a small segment of our operations, primarily to ensure the safety of our customers and their consumers.

Explanation why an extension is in the national security interests of the United States: In 2013, the FDA published a Draft Risk Profile on the prevalence of pathogens and contaminants in spices, identifying significant microbial risks, particularly Salmonella. The FDA found that nearly 7% of examined spice shipments entering the U.S. were contaminated, and both the FDA and Elite Spice believe this rate is likely underestimated due to sampling methods. Effective microbial reduction treatments are essential to protect consumers from life-threatening foodborne pathogens.

The spice industry has relied on Ethylene Oxide for over 70 years as a primary means of mitigating pathogen contamination. Given the limited alternatives, it is critical that EO remains available to safeguard public health and meet FDA safety mandates. Without EO, the industry would struggle to ensure spice safety and would need significant time to evaluate and implement new, effective sterilization technologies.

Due to the anticipated challenges in complying with the new NESHAP standards, companies have invested considerable capital and time in researching and developing alternative sterilization technologies that meet food safety standards while reducing reliance on EO. However, the equipment required for these new technologies has long lead times—often taking 8 to 12 months to deliver as it is designed and manufactured overseas, an additional 4 to 6 months to install, and up to 16 months to validate. This timeline is insufficient to meet the compliance deadline, leaving little time to transition away from EO or fully implement other engineering controls.

With the lack of time to implement new controls required by NESHAP or alternative sterilization technologies, many companies may turn to outsourcing this critical function, often relying on overseas vendors to manage foodborne pathogen risks. While spices may seem minor in the food industry, their widespread use in flavoring a variety of food products means that insufficient treatment could result in large-scale foodborne illness outbreaks, posing a significant public health risk and even a national security threat.

ELITE SPICE

For these reasons, we respectfully request that the EPA extend the compliance timeline to allow for a re-evaluation of the NESHAP and PID regulations. This extension could help prevent foodborne disease outbreaks caused by insufficiently validated technologies or the outsourcing of vital food safety technologies to foreign companies, which could create a public safety vulnerability and potentially endanger the health of the American people. Additionally, it would provide the industry with sufficient time to assess new technologies and ensure that emissions control requirements do not unnecessarily compromise food safety efforts. Ethylene Oxide remains essential to public health by preventing foodborne illnesses.

We appreciate EPA's consideration of the information provided and would be happy to answer any additional questions on the matter.

Best regards,

Amanda Slate

The Honorable Lee M. Zeldin
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW,
Washington, DC 20460

Re: Presidential Exemption: National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Commercial Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24090 (April 5, 2024) (40 CFR Part 63, Subpart O).

Dear Administrator Zeldin,

I write on behalf of Medtronic Xomed LLC ("Xomed") to request that the President issue a two-year exemption pursuant to his authority under Clean Air Act (CAA) Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24090 (Apr. 5, 2024) (Sterilizer Rule).

Xomed requests that a Presidential Exemption be granted to the following facility for all emission sources regulated under the Sterilizer Rule contained therein:

- Xomed Jacksonville Facility, 6743 Southpoint Drive North, Jacksonville, FL, 32216, FDEP Facility ID 0310379.

Xomed further requests that the Presidential Exemption take effect according to the compliance deadlines for the applicable standards in the Sterilizer Rule, as follows:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards); and
- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17, 2025, on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards set forth in the Sterilizer Rule is not available because manufacturers cannot guarantee

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary control and monitoring technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if the Xomed Jacksonville Facility is forced to cease operations on April 6, 2026, that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

If EPA requires additional information regarding the Xomed Jacksonville Facility, including the availability of technology to comply with the Sterilizer Rule or national security risks if the Facility is forced to cease operations, we would be pleased to provide additional information as needed to fully support this request for Presidential Exemption. Please contact me if EPA has any questions or concerns regarding Xomed's request. Xomed appreciates EPA's attention to this important matter. I can be reached by phone at (904) 296-6456 or email tim.romecki@medtronic.com if EPA requires any additional information not act on the requested exemption.

EOSA **The Ethylene Oxide Sterilization Association, Inc.**
Managed by B&C® Consortia Management, L.L.C.

The Honorable Lee Zeldin
Administrator
Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Mail Code: 1101A

Dear Administrator Zeldin:

I write on behalf of the Ethylene Oxide Sterilization Association (EOSA) to ask EPA to take near-term action regarding the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24090 (Apr. 5, 2024), known as the "Sterilizer Rule." The Sterilizer Rule imposes extremely onerous ethylene oxide (EtO) emission standards on medical device sterilizers the most stringent of which must be met by April 2026—and is causing substantial harm to and regulatory uncertainty for EOSA's members.

EPA announced on March 12, 2025, that it will reconsider the Sterilizer Rule (alongside other NESHAPs), which is a welcome development. EOSA was also pleased to see EPA's statement that the Administration "is considering a 2-year compliance exemption via Section 112(i)(4) of the Clean Air Act for affected facilities while EPA goes through the rulemaking process." But medical device sterilizers need to decide *now* whether to expend substantial resources to acquire technology and reconfigure their facilities to try to comply with the Sterilizer Rule—or to instead cease operations. That, in turn, may disrupt the supply of critical medical devices, harming both patients and providers, or force medical providers to source those essential medical devices from abroad—increasing the offshoring of the sterilization of medical devices and inflating costs to Americans in direct contravention of the Trump administration's economic objectives.

The Sterilizer Rule was promulgated by the Biden administration under Clean Air Act ("CAA") Section 112 on April 5, 2024. The Sterilizer Rule includes standards set under Section 112(d), the CAA's hazardous pollutant "technology review" provision, and Section 112(f), the "risk review" provision, the latter of which the D.C. Circuit described as a "*one-time* 'risk review.'" *Nat'l Ass'n for Surface Finishing v. EPA*, 795 F.3d 1, 5 (D.C. Cir. 2015) (emphasis added). There are several major flaws in the Sterilizer Rule, and a litany of other issues and errors.

First, the Sterilizer Rule unlawfully set new standards under Section 112(f) even though EPA previously undertook the one-time risk review for this source category in 2006. 71 Fed. Reg. 17, 712, 17,716 (April 7, 2006). In doing so, EPA ignored the statutory text and context, both of which indicate that Congress intended EPA to regulate primarily through periodic technology reviews under Section 112(d) and conduct only one round of risk-based review under Section 112(f). By ignoring that Congressional mandate, EPA wrongly avoided Section 112(d)'s requirement that the agency must consider costs when setting and revising technology-based standards.

Second, the emission standards set in the Sterilizer Rule—particularly under Section 112(f), but also those set under Section 112(d) are extremely onerous, unsupported by the record data, and for some sterilizers will be impossible to meet. For example, EPA increased the standard for sterilization chamber vents using at least 30 tons per year ("tpy") of EtO from a 99% destruction

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

and removal efficiency (DRE) standard to a 99.99% DRE standard. This leaves no margin for error or equipment malfunction. Likewise, for aeration room vents ("ARVs") using at least 30 tpy of EtO, the Sterilizer Rule increased the DRE requirement from 99% to 99.9%, while wrongly rejecting commenters' request for an alternative standard. Both the SCV and ARV standards were premised on test data that EPA admitted, in the Proposed Rule, is not representative of normal operations. *See* 88 Fed. Reg. at 22,844. EPA also imposed stringent new standards on area sources; for example, EPA set a chamber exhaust vent emission standard of 99.9% DRE for facilities using at least 60 tpy of EtO. These are just a few of the stringent standards set in the Sterilizer Rule under Sections 112(f) and (d), all of which are unrealistic and unsupported by the record.

The Sterilizer Rule is also flawed because EPA arbitrarily and capriciously imposed onerous Continuous Emission Monitoring System (CEMS) mandates on facilities using at least 100 lb/year of EtO without proper notice and comment. Replacing parametric monitoring with CEMS, operating at fifteen-minutes intervals and demonstrating 90% data availability, is costly, complicated, and burdensome, while emission reduction benefits are minimal. Further, EPA failed to allow commenters to weigh in on the CEMS scheme the agency finalized, which requires application of CEMS *at each emissions inlet*, not just outlets. This CEMS scheme is thus both arbitrary and unlawful.

EOSA challenged the Sterilizer Rule in the United States Court of Appeals for the District of Columbia Circuit (No. 24-1180). In addition to raising the above major concerns, EOSA also explained that EPA wrongly set standards based on EtO *usage*, rather than based on EtO *emissions* (as the text of Section 112 requires); failed to establish technology-based standards under Section 112(d) before imposing certain of the risk-based standards; failed to consider and address comments on EPA's reliance on the flawed IRIS value for EtO; and failed to conduct rational cost/benefit analysis in deciding whether and to what extent to revise all standards. A fuller discussion of all of these issues can be found in EOSA's opening merits brief (Doc. #2080994).

As noted above, EPA has announced it will reconsider the Sterilizer Rule. EPA also recently moved to hold the litigation over the Sterilizer Rule in abeyance for 60 days "to allow new Agency leadership to review" the Sterilizer Rule and "to decide what action, if any, is necessary." *Cal. Cmtys. Against Toxics v. EPA*, No. 24-1178 (D.C. Cir. filed Feb. 18, 2025) (Doc. 2101209). EOSA appreciates EPA's recognition of the need to reconsider the Sterilizer Rule. But while EPA does so, EOSA's members continue to face the Sterilizer Rule's fast-approaching compliance deadlines: April 6, 2026, for standards set under Section 112(f) and April 5, 2027, for standards set under Section 112(d). These deadlines (particularly the former, which applies to the most stringent standards) require sterilizers to decide now whether to commit significant financial and operational resources—including to purchase new control technologies, redesign facilities, and restructure operations—to try to comply with the Sterilizer Rule, which is not possible for all facilities.

Lending further urgency to EPA's reconsideration of the Sterilizer Rule and the standards and deadlines set therein, the D.C. Circuit denied EPA's abeyance motion and the case has been set for argument on April 15, 2025. EOSA therefore urges EPA to act quickly to relieve sterilizers of the Sterilizer Rule's obligations, preventing unnecessary expenditures and irrevocable decisions that some sterilizers will likely be forced to make absent near-term relief.

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

To address the urgent compliance challenges posed by the Sterilizer Rule, EOSA identifies two potential pathways for relief. Ideally, EPA should pursue both to ensure that sterilizers can continue to operate in the near term, even while EPA reconsiders the Sterilizer Rule more broadly.

Path 1: Presidential Waiver under Section 112(i)(4)

As suggested by EPA, the President should exercise his authority under CAA § 112(i)(4) to grant a two-year compliance exemption commencing on the Sterilizer Rule's compliance deadlines: April 6, 2026, for risk-based standards and April 5, 2027, for technology-based standards. The President may grant such an exemption for all sources regulated by the Sterilizer Rule in one action,[1] based upon findings that (1) "it is in the national security interests … to do so" and (2) "the technology to implement such standard is not available." 42 U.S.C. § 7412(i)(4).

The first requirement—national security interests—is satisfied due to the critical role that sterilization facilities play in maintaining the U.S. medical device supply chain. Compliance with the Sterilizer Rule's deadlines, particularly the two-year deadline for compliance with the risk-based standards set under Section 112(f), will significantly reduce sterilization capacity. This, in turn, will lead to severe shortages of life-critical medical devices such as catheters, surgical kits, syringes, bandages, IV equipment, and needles, disrupting essential healthcare services. EOSA cautioned in its Comments on the Proposed Sterilizer Rule that the loss of capacity while facility reconstruction and modifications are underway will cause "a large reduction in medical device sterilization capacity and a severe shortage of sterilized medical devices." EOSA Comments 59, EPA-HQ-OAR-2019-0178-0618. Medical industry stakeholders similarly noted that modifying sterilization equipment is "no trivial matter":

> These complex facilities, no two of which share the same design or process, typically must go at least partially offline to make modifications to the equipment. Even routine maintenance or periodic upgrades require significant planning to minimize downtime across the monthly or annual supply cycle.

Advanced Medical Technology Association Comments 9–10, EPA-HQ-OAR-2019-0178-0601.

Without relief, sterilizers may be unable to meet demand for sterilized medical devices, leading to shortages that force medical providers to seek alternative sources abroad and increase the United States' dependence on foreign suppliers for essential medical devices. This growing reliance on foreign sterilization capacity and imported medical equipment poses an immediate national security risk, as any disruption—whether from geopolitical conflicts, trade restrictions, or economic coercion—could severely limit the United States' ability to maintain an independent and resilient healthcare system, jeopardizing timely access to life-saving medical equipment.

[1] Nothing in Section 112(i)(4) bars the President from issuing an exemption that applies to all regulated sources—and the President should do so here to ensure that all sterilization facilities are relieved from the obligation to comply with the Sterilizer Rule.

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

The second requirement technology unavailability is also met. It will be impossible for all regulated sources to obtain and install necessary control technology by April 2026 due to the limited number of equipment manufacturers and workforce shortages.

EOSA has explained that many of the Sterilizer Rule's requirements "require significant facility reconstruction and major equipment procurement and installation" that could take years—particularly if all sterilizers must redesign their facilities and install equipment to meet the new standards at the same time. EOSA Comments 58 59. And "[t]he availability of the equipment, materials, and contractor services necessary to modify emission control systems is severely limited." Sterigenics Comments 28, EPA-HQ-OAR-2019-0178-0632. Between supply chain constraints, the time-intensive process of facility redesign to accommodate new equipment, and the extensive testing and validation required before any system can become operational, the necessary control technology is functionally unavailable within the required timeframes.

Further, even if it were possible for all facilities to secure the needed equipment and make the necessary design and structural changes within the current compliance periods, the limited number of experienced installation professionals and technical experts who support this industry makes timely compliance by all regulated sources logistically infeasible. *See* AdvaMed Comments at 10. There is simply no way that all regulated sources will be able to obtain both the necessary equipment *and* the skilled technicians needed to successfully install, test, and bring that equipment online within the same two-year period, as required under the Sterilizer Rule.

Finally, control device manufacturers cannot guarantee that their equipment will operate to meet the Sterilizer Rule's stringent performance deadlines. *See* Sterigenics Comments at 28. This further highlights the technological infeasibility of meeting the current compliance deadlines as well as the irrationality and infeasibility of the standards themselves. This is a particularly compelling basis for the President to find that "the technology to implement such standard is not available," 42 U.S.C. § 7412(i)(4), and grant a two-year waiver.

Even the Biden Administration recognized the compliance challenges posed by the Sterilizer Rule. In its *Memorandum on the Orderly Implementation of the Air Toxics Standards for Ethylene Oxide Commercial Sterilizers* (Jan. 16, 2025), the Administration acknowledged that waivers or exemptions may be necessary to "achiev[ing] the … Rule's critical health protections as soon as practicable, while safeguarding the supply of safe medical products from disruption that would compromise the health and welfare of the American people."

EPA should therefore urge President Trump to exercise his authority under Section 112(i)(4) and quickly issue a two-year compliance exemption for all sources regulated under the Sterilizer Rule, effective when each set of standards set therein would otherwise apply. The exemptions then may be extended for one or more additional periods, if necessary.

Path 2: EPA Rulemaking to Stay or Extend Deadlines

Also or alternatively, EPA should take a near-term discrete administrative action to rescind the Rule 112(f) risk-based standards, or at least stay the compliance deadlines, based on a finding that the standards are likely unlawful and EPA's stated commitment to reconsider the Sterilizer Rule.

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

Because Section 112(f) allows EPA to grant no more than two years for compliance with risk-based standards (although, as discussed above, the President may issue a further two-year exemption—and should do so here), EPA should take near-term, discrete administrative action to rescind at least the risk-based standards set in the Sterilizer Rule based on a finding that its reliance on Section 112(f) to revise EtO emission standards was unlawful. EPA has a solid basis for taking that initial step now: under the Biden Administration, EPA ignored the statutory text and context, both of which confirm that the risk-review is (as the D.C. Circuit previously stated), a "one-time" event, and therefore EPA's conduct of a second risk review was unlawful.

Alternatively, EPA could take a discrete administrative action to stay the Sterilizer Rule's compliance deadlines (ideally for all standards, but at least the Section 112(f) risk-based standards) pending completion of reconsideration and a new notice-and-comment rulemaking process to rescind, replace, or revise the Sterilizer Rule. Such action would relieve sterilizers of near-term compliance obligations and reduce the risk that many sterilizers will cease operations and thereby disrupt the supply of medical devices even while EPA is reconsidering the Sterilizer Rule.

Because the Sterilizer Rule is the result of a notice-and-comment rulemaking process, rescinding or revising the Sterilizer Rule or even just staying the compliance deadlines likely also requires rulemaking to minimize the chance that a reviewing court vacates such action. But EPA could invoke the Administrative Procedure Act's "good cause" exception to notice and comment because the key legal issue whether EPA can conduct a second round of risk review for a source category has already been subject to a notice-and-comment process, and it is a pure statutory construction question on which EPA can correct course now. Further notice-and-comment on that issue is thus "unnecessary," and it is also "impracticable" and "contrary to the public interest" given the urgency of the issue and the impact on the medical device supply chain. *See* 5 U.S.C. 553(b)(B). Or, EPA could issue an interim final rule rescinding at least the Section 112(f) standards and thereby obviating the nearest-term compliance deadlines. This option would allow further notice and comment, but still provide immediate relief for sterilizers facing the difficult choice whether to try to comply with the Sterilizer Rule despite the near-impossibility of doing so or cease operations and disrupt the domestic medical supply chain.

* * * *

EOSA appreciates EPA's commitment to reconsidering the Sterilizer Rule and addressing the concerns of regulated facilities. EOSA also appreciates the Agency's willingness to consider near-term actions, such as a Presidential exemption and/or discrete administrative action to address the Section 112(f) standards and associated compliance deadlines. As many facilities confront immediate investment decisions, regulatory clarity is essential. EOSA urges EPA to take timely action to ensure that sterilization facilities remain operational while advancing long-term regulatory solutions that balance public health objectives with industry feasibility.

Thank you for your consideration. Please feel free to contact me at mzhuang@bc-cm.com if you have any questions regarding this request.

Re: Presidential Exemption: National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Commercial Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24090 (April 5, 2024) (40 CFR Part 63, Subpart O).

Dear Administrator Zeldin,

I write on behalf of Medtronic Puerto Rico Operations Company, Inc. ("MPROC") to request that the President issue a two-year exemption pursuant to his authority under Clean Air Act (CAA) Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24090 (Apr. 5, 2024) (Sterilizer Rule).

MPROC requests that a Presidential Exemption be granted to the following facilities for all emission sources regulated under the Sterilizer Rule contained therein:

- MPROC Villalba Facility, Parque Industrial Villalba Arriba, Carr. PR-149, Km. 56.3, Villalba, Puerto Rico, Operating Permit No. PFE-RG-76-0217-0107-I-II-O

- MPROC Juncos Facility, 50 Ceiba Industrial Park, Carr. PR-31, Km. 24.4, Juncos, Puerto Rico, Operating Permit No. PFE-40-0416-0251-I-II-O

MPROC further requests that the Presidential Exemption take effect according to the compliance deadlines for the standards in the Sterilizer Rule, as applicable:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards); and
- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

Following publication of the Sterilizer Rule, MPROC determined that the sterilization operations of the Juncos Facility and Villalba Facility should be consolidated at the Villalba Facility to comply with the final Rule. However, the Villalba Facility must demonstrate compliance with the Sterilizer Rule before production and sterilization capacity can be relocated from Juncos. MPROC has timely applied for a modification to the Villalba Facility's operating permit but its application is currently pending review by the Puerto Rico Department of Natural and Environmental Resources (DNER).[1]

As explained further in the attached letter submitted to EPA on March 17, 2025, on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards set forth in the Sterilizer Rule is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary control and monitoring technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if the MPROC Juncos Facility and Villalba Facility are forced to cease operations on April 5, 2027, that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

If EPA requires additional information regarding the MPROC Juncos Facility and Villalba Facility, including the availability of technology to comply with the Sterilizer Rule or national security risks if the Facilities are forced to cease operations, we would be pleased to provide additional information as needed to fully support this request for Presidential Exemption. Please contact me if EPA has any questions or concerns regarding MPROC's request. MPROC appreciates EPA's attention to this important matter. I can be reached by email at thomas.l.osteraas@medtronic.com if EPA requires any additional information not act on the requested exemption.

EOSA **The Ethylene Oxide Sterilization Association, Inc.**
Managed by B&C® Consortia Management, L.L.C.

The Honorable Lee Zeldin
Administrator
Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Mail Code: 1101A

Dear Administrator Zeldin:

I write on behalf of the Ethylene Oxide Sterilization Association (EOSA) to ask EPA to take near-term action regarding the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24090 (Apr. 5, 2024), known as the "Sterilizer Rule." The Sterilizer Rule imposes extremely onerous ethylene oxide (EtO) emission standards on medical device sterilizers the most stringent of which must be met by April 2026—and is causing substantial harm to and regulatory uncertainty for EOSA's members.

EPA announced on March 12, 2025, that it will reconsider the Sterilizer Rule (alongside other NESHAPs), which is a welcome development. EOSA was also pleased to see EPA's statement that the Administration "is considering a 2-year compliance exemption via Section 112(i)(4) of the Clean Air Act for affected facilities while EPA goes through the rulemaking process." But medical device sterilizers need to decide *now* whether to expend substantial resources to acquire technology and reconfigure their facilities to try to comply with the Sterilizer Rule—or to instead cease operations. That, in turn, may disrupt the supply of critical medical devices, harming both patients and providers, or force medical providers to source those essential medical devices from abroad—increasing the offshoring of the sterilization of medical devices and inflating costs to Americans in direct contravention of the Trump administration's economic objectives.

The Sterilizer Rule was promulgated by the Biden administration under Clean Air Act ("CAA") Section 112 on April 5, 2024. The Sterilizer Rule includes standards set under Section 112(d), the CAA's hazardous pollutant "technology review" provision, and Section 112(f), the "risk review" provision, the latter of which the D.C. Circuit described as a "*one-time* 'risk review.'" *Nat'l Ass'n for Surface Finishing v. EPA*, 795 F.3d 1, 5 (D.C. Cir. 2015) (emphasis added). There are several major flaws in the Sterilizer Rule, and a litany of other issues and errors.

First, the Sterilizer Rule unlawfully set new standards under Section 112(f) even though EPA previously undertook the one-time risk review for this source category in 2006. 71 Fed. Reg. 17, 712, 17,716 (April 7, 2006). In doing so, EPA ignored the statutory text and context, both of which indicate that Congress intended EPA to regulate primarily through periodic technology reviews under Section 112(d) and conduct only one round of risk-based review under Section 112(f). By ignoring that Congressional mandate, EPA wrongly avoided Section 112(d)'s requirement that the agency must consider costs when setting and revising technology-based standards.

Second, the emission standards set in the Sterilizer Rule—particularly under Section 112(f), but also those set under Section 112(d) are extremely onerous, unsupported by the record data, and for some sterilizers will be impossible to meet. For example, EPA increased the standard for sterilization chamber vents using at least 30 tons per year ("tpy") of EtO from a 99% destruction

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

and removal efficiency (DRE) standard to a 99.99% DRE standard. This leaves no margin for error or equipment malfunction. Likewise, for aeration room vents ("ARVs") using at least 30 tpy of EtO, the Sterilizer Rule increased the DRE requirement from 99% to 99.9%, while wrongly rejecting commenters' request for an alternative standard. Both the SCV and ARV standards were premised on test data that EPA admitted, in the Proposed Rule, is not representative of normal operations. *See* 88 Fed. Reg. at 22,844. EPA also imposed stringent new standards on area sources; for example, EPA set a chamber exhaust vent emission standard of 99.9% DRE for facilities using at least 60 tpy of EtO. These are just a few of the stringent standards set in the Sterilizer Rule under Sections 112(f) and (d), all of which are unrealistic and unsupported by the record.

The Sterilizer Rule is also flawed because EPA arbitrarily and capriciously imposed onerous Continuous Emission Monitoring System (CEMS) mandates on facilities using at least 100 lb/year of EtO without proper notice and comment. Replacing parametric monitoring with CEMS, operating at fifteen-minutes intervals and demonstrating 90% data availability, is costly, complicated, and burdensome, while emission reduction benefits are minimal. Further, EPA failed to allow commenters to weigh in on the CEMS scheme the agency finalized, which requires application of CEMS *at each emissions inlet*, not just outlets. This CEMS scheme is thus both arbitrary and unlawful.

EOSA challenged the Sterilizer Rule in the United States Court of Appeals for the District of Columbia Circuit (No. 24-1180). In addition to raising the above major concerns, EOSA also explained that EPA wrongly set standards based on EtO *usage*, rather than based on EtO *emissions* (as the text of Section 112 requires); failed to establish technology-based standards under Section 112(d) before imposing certain of the risk-based standards; failed to consider and address comments on EPA's reliance on the flawed IRIS value for EtO; and failed to conduct rational cost/benefit analysis in deciding whether and to what extent to revise all standards. A fuller discussion of all of these issues can be found in EOSA's opening merits brief (Doc. #2080994).

As noted above, EPA has announced it will reconsider the Sterilizer Rule. EPA also recently moved to hold the litigation over the Sterilizer Rule in abeyance for 60 days "to allow new Agency leadership to review" the Sterilizer Rule and "to decide what action, if any, is necessary." *Cal. Cmtys. Against Toxics v. EPA*, No. 24-1178 (D.C. Cir. filed Feb. 18, 2025) (Doc. 2101209). EOSA appreciates EPA's recognition of the need to reconsider the Sterilizer Rule. But while EPA does so, EOSA's members continue to face the Sterilizer Rule's fast-approaching compliance deadlines: April 6, 2026, for standards set under Section 112(f) and April 5, 2027, for standards set under Section 112(d). These deadlines (particularly the former, which applies to the most stringent standards) require sterilizers to decide now whether to commit significant financial and operational resources—including to purchase new control technologies, redesign facilities, and restructure operations—to try to comply with the Sterilizer Rule, which is not possible for all facilities.

Lending further urgency to EPA's reconsideration of the Sterilizer Rule and the standards and deadlines set therein, the D.C. Circuit denied EPA's abeyance motion and the case has been set for argument on April 15, 2025. EOSA therefore urges EPA to act quickly to relieve sterilizers of the Sterilizer Rule's obligations, preventing unnecessary expenditures and irrevocable decisions that some sterilizers will likely be forced to make absent near-term relief.

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

To address the urgent compliance challenges posed by the Sterilizer Rule, EOSA identifies two potential pathways for relief. Ideally, EPA should pursue both to ensure that sterilizers can continue to operate in the near term, even while EPA reconsiders the Sterilizer Rule more broadly.

Path 1: Presidential Waiver under Section 112(i)(4)

As suggested by EPA, the President should exercise his authority under CAA § 112(i)(4) to grant a two-year compliance exemption commencing on the Sterilizer Rule's compliance deadlines: April 6, 2026, for risk-based standards and April 5, 2027, for technology-based standards. The President may grant such an exemption for all sources regulated by the Sterilizer Rule in one action,[1] based upon findings that (1) "it is in the national security interests … to do so" and (2) "the technology to implement such standard is not available." 42 U.S.C. § 7412(i)(4).

The first requirement—national security interests—is satisfied due to the critical role that sterilization facilities play in maintaining the U.S. medical device supply chain. Compliance with the Sterilizer Rule's deadlines, particularly the two-year deadline for compliance with the risk-based standards set under Section 112(f), will significantly reduce sterilization capacity. This, in turn, will lead to severe shortages of life-critical medical devices such as catheters, surgical kits, syringes, bandages, IV equipment, and needles, disrupting essential healthcare services. EOSA cautioned in its Comments on the Proposed Sterilizer Rule that the loss of capacity while facility reconstruction and modifications are underway will cause "a large reduction in medical device sterilization capacity and a severe shortage of sterilized medical devices." EOSA Comments 59, EPA-HQ-OAR-2019-0178-0618. Medical industry stakeholders similarly noted that modifying sterilization equipment is "no trivial matter":

> These complex facilities, no two of which share the same design or process, typically must go at least partially offline to make modifications to the equipment. Even routine maintenance or periodic upgrades require significant planning to minimize downtime across the monthly or annual supply cycle.

Advanced Medical Technology Association Comments 9–10, EPA-HQ-OAR-2019-0178-0601.

Without relief, sterilizers may be unable to meet demand for sterilized medical devices, leading to shortages that force medical providers to seek alternative sources abroad and increase the United States' dependence on foreign suppliers for essential medical devices. This growing reliance on foreign sterilization capacity and imported medical equipment poses an immediate national security risk, as any disruption—whether from geopolitical conflicts, trade restrictions, or economic coercion—could severely limit the United States' ability to maintain an independent and resilient healthcare system, jeopardizing timely access to life-saving medical equipment.

[1] Nothing in Section 112(i)(4) bars the President from issuing an exemption that applies to all regulated sources—and the President should do so here to ensure that all sterilization facilities are relieved from the obligation to comply with the Sterilizer Rule.

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

The second requirement technology unavailability is also met. It will be impossible for all regulated sources to obtain and install necessary control technology by April 2026 due to the limited number of equipment manufacturers and workforce shortages.

EOSA has explained that many of the Sterilizer Rule's requirements "require significant facility reconstruction and major equipment procurement and installation" that could take years—particularly if all sterilizers must redesign their facilities and install equipment to meet the new standards at the same time. EOSA Comments 58 59. And "[t]he availability of the equipment, materials, and contractor services necessary to modify emission control systems is severely limited." Sterigenics Comments 28, EPA-HQ-OAR-2019-0178-0632. Between supply chain constraints, the time-intensive process of facility redesign to accommodate new equipment, and the extensive testing and validation required before any system can become operational, the necessary control technology is functionally unavailable within the required timeframes.

Further, even if it were possible for all facilities to secure the needed equipment and make the necessary design and structural changes within the current compliance periods, the limited number of experienced installation professionals and technical experts who support this industry makes timely compliance by all regulated sources logistically infeasible. *See* AdvaMed Comments at 10. There is simply no way that all regulated sources will be able to obtain both the necessary equipment *and* the skilled technicians needed to successfully install, test, and bring that equipment online within the same two-year period, as required under the Sterilizer Rule.

Finally, control device manufacturers cannot guarantee that their equipment will operate to meet the Sterilizer Rule's stringent performance deadlines. *See* Sterigenics Comments at 28. This further highlights the technological infeasibility of meeting the current compliance deadlines as well as the irrationality and infeasibility of the standards themselves. This is a particularly compelling basis for the President to find that "the technology to implement such standard is not available," 42 U.S.C. § 7412(i)(4), and grant a two-year waiver.

Even the Biden Administration recognized the compliance challenges posed by the Sterilizer Rule. In its *Memorandum on the Orderly Implementation of the Air Toxics Standards for Ethylene Oxide Commercial Sterilizers* (Jan. 16, 2025), the Administration acknowledged that waivers or exemptions may be necessary to "achiev[ing] the … Rule's critical health protections as soon as practicable, while safeguarding the supply of safe medical products from disruption that would compromise the health and welfare of the American people."

EPA should therefore urge President Trump to exercise his authority under Section 112(i)(4) and quickly issue a two-year compliance exemption for all sources regulated under the Sterilizer Rule, effective when each set of standards set therein would otherwise apply. The exemptions then may be extended for one or more additional periods, if necessary.

Path 2: EPA Rulemaking to Stay or Extend Deadlines

Also or alternatively, EPA should take a near-term discrete administrative action to rescind the Rule 112(f) risk-based standards, or at least stay the compliance deadlines, based on a finding that the standards are likely unlawful and EPA's stated commitment to reconsider the Sterilizer Rule.

Docusign Envelope ID: 88B000C8-D097-434F-8811-476E9C203CA2

Because Section 112(f) allows EPA to grant no more than two years for compliance with risk-based standards (although, as discussed above, the President may issue a further two-year exemption—and should do so here), EPA should take near-term, discrete administrative action to rescind at least the risk-based standards set in the Sterilizer Rule based on a finding that its reliance on Section 112(f) to revise EtO emission standards was unlawful. EPA has a solid basis for taking that initial step now: under the Biden Administration, EPA ignored the statutory text and context, both of which confirm that the risk-review is (as the D.C. Circuit previously stated), a "one-time" event, and therefore EPA's conduct of a second risk review was unlawful.

Alternatively, EPA could take a discrete administrative action to stay the Sterilizer Rule's compliance deadlines (ideally for all standards, but at least the Section 112(f) risk-based standards) pending completion of reconsideration and a new notice-and-comment rulemaking process to rescind, replace, or revise the Sterilizer Rule. Such action would relieve sterilizers of near-term compliance obligations and reduce the risk that many sterilizers will cease operations and thereby disrupt the supply of medical devices even while EPA is reconsidering the Sterilizer Rule.

Because the Sterilizer Rule is the result of a notice-and-comment rulemaking process, rescinding or revising the Sterilizer Rule or even just staying the compliance deadlines likely also requires rulemaking to minimize the chance that a reviewing court vacates such action. But EPA could invoke the Administrative Procedure Act's "good cause" exception to notice and comment because the key legal issue whether EPA can conduct a second round of risk review for a source category has already been subject to a notice-and-comment process, and it is a pure statutory construction question on which EPA can correct course now. Further notice-and-comment on that issue is thus "unnecessary," and it is also "impracticable" and "contrary to the public interest" given the urgency of the issue and the impact on the medical device supply chain. *See* 5 U.S.C. 553(b)(B). Or, EPA could issue an interim final rule rescinding at least the Section 112(f) standards and thereby obviating the nearest-term compliance deadlines. This option would allow further notice and comment, but still provide immediate relief for sterilizers facing the difficult choice whether to try to comply with the Sterilizer Rule despite the near-impossibility of doing so or cease operations and disrupt the domestic medical supply chain.

* * * *

EOSA appreciates EPA's commitment to reconsidering the Sterilizer Rule and addressing the concerns of regulated facilities. EOSA also appreciates the Agency's willingness to consider near-term actions, such as a Presidential exemption and/or discrete administrative action to address the Section 112(f) standards and associated compliance deadlines. As many facilities confront immediate investment decisions, regulatory clarity is essential. EOSA urges EPA to take timely action to ensure that sterilization facilities remain operational while advancing long-term regulatory solutions that balance public health objectives with industry feasibility.

Thank you for your consideration. Please feel free to contact me at mzhuang@bc-cm.com if you have any questions regarding this request.

Subject: Sterilizer Rule (89 FR 24090): APS- Owned and Operated Facilities
Date: Monday, March 31, 2025 9:58:56 PM
Attachments: Outlook-akkqsiqd.png

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

I write on behalf of APS- Advanced Product Solutions to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

APS requests that the Presidential Exemption apply to the following facilities regulated by the Sterilizer Rule and all sources therein:

- APS- Advanced Product Solutions, 502 West Church Street Columbia, AL 36319

APS requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);

- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. APS appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

Joseph Bowen

Plant Manager, APS-ETO

Re: Sterilizer Rule (89 FR 24090): MedXL, LLC

I write on behalf of MedXL, to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

MedXL requests that the Presidential Exemption apply to the following facilities regulated by the Sterilizer Rule and all sources therein:

- MedXL, 3204 Hale Road, Ardmore, Oklahoma 73401

MedXL requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);

- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. MedXL appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

Thank you!

From:	Travis Anderton
To:	AirAction
Subject:	NESHAP: Ethylene Oxide Emissions Standards for Sterilization Facilities (89 FR 24090) (Sterilizer Rule); Becton Dickinson and Company facilities
Date:	Thursday, March 27, 2025 4:39:24 PM

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Dear Administrator Zeldin,

Consistent with EPA's request dated March 24, 2025, encouraging the regulated community to request a Presidential Exemption for compliance under section 112(i)(4) of the Clean Air Act (CAA) by March 31, 2025, Becton Dickinson and Company (BD) is requesting that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards, monitoring requirements and any other applicable requirements in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule). BD requests this two-year compliance exemption for the following facilities which are regulated by the Sterilizer Rule and all sources therein:

Becton Dickinson and Company
BD Covington
8195 Industrial Boulevard
Covington, Georgia

Becton Dickinson and Company
BD Madison
1211 Mary Magnan Boulevard
Madison, Georgia

Becton Dickinson and Company
BD Medical
9450 South State Street
Sandy, Utah

Becton Dickinson and Company
BD Medical Pharmaceutical Systems
920 East 19th Street
Columbus, Nebraska

Becton Dickinson and Company
Edwards Lifesciences Technology Sàrl
Parque Industrial Carr. PR-402, Km. 1.4 N
Anasco, Puerto Rico

BD requests that the President issue a two-year exemption for compliance related to the new Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);
- For standards set or revised under CAA Section 112(d) and all corresponding requirements

(including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

An extension is requested to ensure that the technology used to comply with the standard is available, capable, and reliable:

Despite our best efforts, BD may not meet the April 6, 2026 compliance deadline. Although we started planning and design activities well in advance of the issuance of the new rule, the time necessary to execute very complex plant upgrades will likely exceed the compliance deadline(s). These upgrades require a methodical approach to engineering, procurement, and construction, including but not limited to; project planning, supplier qualification, facility and equipment design, procurement, permitting and approval by State and local authorities, construction of facilities, equipment installation, commissioning and validation, as well as training. Many of the systems and equipment necessary to meet the new rule are not off-the-shelf solutions. Each facility is unique, requiring highly customized solutions and will require careful integration and testing to ensure full compliance with various regulations and to avoid compromised safety of the operation, reliability of the plant and equipment, and to avoid disruption of supply.

It is questionable whether even the best control technologies can meet the requirements of the new rule under all operating conditions. For example, it is questionable whether or not certain emissions control devices can meet minimum DRE requirements under low inlet conditions such as would be expected during periods of low production, reduced operating capacity, plant shutdown/startup, and other atypical operating scenarios. It is also questionable whether current technology for the control of Group 1 and Group 2 emissions can meet the minimum DRE requirements under all operating conditions. Product type and volume sterilized at each facility vary widely and may be subject to swings in market demand among other external factors.

Additionally, the lead time of various materials and equipment required for the plant upgrades is variable. For example, the lead time of emissions control equipment is approximately 12-18 months and there is only a limited number of vendors who can supply this equipment, and the lead time for high voltage transformers and electrical switch gear are currently 12 months or greater. In some cases additional utility requirements necessitate the involvement of the public utility company to increase local or regional capacity which may add additional complexity and time to project schedules.

Furthermore, BD anticipates additional financial burden and import/customs clearance complexity with the import of custom emissions control equipment specific to the Covington, Georgia and Madison, Georgia facility which add additional financial burden and lead time for delivery of such equipment due to current and pending tariffs.

An extension is in the national security interests of the United States for the following reasons:

BD supplies billions of sterile medical devices that enable healthcare providers to safely provide a variety of life saving therapies to patients in the US and around the world. Additionally, BD is a key supplier to the US Government.

Medical devices must be sterilized to prevent the spread of bacteria, viruses, and other pathogens, like methicillin-resistant Staphylococcus aureus ("MRSA"), HIV, and hepatitis B, that can lead to deadly infections. While BD sites deploy a variety of sterilization methods, approximately 50% of BD products currently can only be sterilized with EtO, including IV catheters, PICC catheters, surgical

prep devices, surgical kits, Foley urinary catheter trays, glass syringes, chemotherapy ports, among many others. A more detailed summary of several of these products are outlined below.

BD produces sterile vascular access devices that allow healthcare providers to safely give medications, hydration and nutritional fluid therapies, and blood products to patients used both in the hospital as well as in outpatient areas of healthcare. Up to 90 % of hospitalized patients require IV therapy, and over 95% of the devices used are peripheral IV catheters ("PIVC"). This corresponds to over 1 billion peripheral IV insertions being performed worldwide, annually. BD supplies a significant portion of IV catheters to the US market.

BD produces drug delivery devices that improve a patient's quality of life, including ready-to-fill syringes that are used to deliver drugs and vaccines indicated to prevent invasive diseases, reduce the risks of life changing conditions like heart attacks and strokes, as well as treat chronic conditions such as Crohn's disease, arthritis and diabetes. A large majority of the injectable biotech drugs delivered subcutaneously or intramuscularly are delivered in BD's sterile Prefillable Syringes. Many of the top bio-pharma companies rely heavily on BD for these products.

BD also produces devices used to diagnose and treat patients with cancer (especially breast, liver and blood cancers), end-stage-renal disease, peripheral arterial disease, complex abdominal hernia and reconstruction, and hemostasis to prevent bleeding during advanced surgical procedures. Our products are used in the majority of patients undergoing surgery in these areas and those in intensive care/post-operative care units.

BD utilizes EtO sterilization because it is the only method of sterilization that can be used for these products. As EPA explains, "Commercial sterilization facilities play a vital role in maintaining an adequate supply of medical devices. According to the U.S. Food and Drug Administration (FDA), 'Literature shows that about fifty percent of all sterile medical devices in the U.S. are sterilized with ethylene oxide.'" 88 Fed. Reg. 22,793.

As voiced directly to EPA during the public comment period BD believes that the technical complexity of the new rules and the aggressive compliance deadline threaten supply continuity for critical medical products. BD respectfully requests extension to the compliance deadline to ensure upgrades are designed, constructed, and commissioned in accordance with all applicable regulatory requirements and industry standards while maintaining safe operations and avoiding unnecessary supply disruptions that would threaten or diminish the standard of care for patients.

BD appreciates EPA's attention to this important matter and request the exemption be granted as quickly as possible.

Respectfully,

Travis Anderton

BD

Travis Anderton
Vice President, Sterilization

RE: Clear Air Act Section 112 (i)(4) Presidential Exemption

To whom it may concern:

Exemption request from Ethylene Oxide Emissions Standards for Sterilization Facilities: National Emission Standards for Hazardous Air Pollutants (NESHAP) - 40 CFR 60 and 63 subpart O standards that were final April 5, 2024.

Facilities affected:

1. Windstone Medical Packaging Inc. 1602 4th Ave. North Billings, MT 59102
2. Windstone Medical Packaging Inc. 1400 Montana Ave. Billings, MT 59102

Windstone Medical Packaging, Inc. dba Aligned Medical Solutions is a small business located in Billings, Montana that packages and sterilizes custom convenience kits sold to hospitals and surgery centers throughout the United States. We employ a total of 240 people, so we believe we meet the small business size standard for companies that make or process surgical appliances and supplies. NAICS Code 339113. Due to our use of ethylene oxide, we are subject to NESHAP 40 CRF 60 and 63 subpart O. We are requesting an additional 2-year compliance extension until April 5, 2029 for our facilities.

On March 21, 2025, EPA stated that it will reconsider the EtO sterilization rules. In that reconsideration, Windstone will invite EPA's attention to the low-polluting nature of Windstone's EtO sterilization process, something EPA inadequately considered in the prior rulemaking process.

Windstone Medical Packaging Inc. uses ethylene oxide (EtO) to sterilize custom convenience kits, kits which contain the sterilized medical supplies and devices tailored for specific kinds of surgical procedures according to the customer's detailed requirements. The use of these custom kits streamlines time in surgery, enhancing patient safety and improving the capacity of existing hospital surgical units.

Windstone's sterilization method differs from its large volume competitors, which use large chambers to sterilize medical supplies in bulk. By contrast, Windstone uses "flexible chamber" technology, in other words, it encases each custom kit in a plastic bag and injects Ethylene Oxide (EtO) into the bag. Windstone believes that it uses far less EtO per item sterilized than its large volume competitors use. Windstone's method is inherently

1602 4th Ave North
Telephone: 1-800-637-7056
Billings, MT
Office: 406-259-6387
www.amsaligned.com
Fax: 406-256-9875

low polluting, reducing EtO usage per item sterilized by as much as 90% compared to more common EtO sterilization methods.

EPA failed to consider these efficiencies adequately in the rulemaking process when it set percentage reduction limits on EtO emissions. Indeed, as nearly as Windstone can determine, EPA failed to consider Windstone's facilities at any time in this rulemaking process. As a consequence, the percentage limits EPA set effectively punish rather than reward Windstone for Windstone's reduced usage of EtO per item sterilized.

We believe the following additional cost, timing, and mortality factors further justify the request for an extension for compliance with the rule:

1. After the rule was finalized Windstone Medical Packaging engaged with an engineering company to develop the basis of design (BOD) for compliance. The BOD was performed and determined the cost to comply would require a capital expenditure of Ex. 4 CBI As a small business with 2024 sales of only Ex. 4 CBI, this enormous regulatory compliance cost is not feasible within the current compliance timeline and presents a significant hurdle for growth, job creation and potentially reduced sterilization capacity. Due to the extremely high cost of compliance, we believe an extension is justified. Under the circumstances, the technology needed to achieve the required percentage emission reductions (beyond those already accomplished by Windstone's low polluting sterilization method), is not reasonably available to Windstone within the meaning of section 112(i)(4) of the Clean Air Act. 42 U.S.C. Section 7412(i)(4)

2. Windstone believes that the current percentage reduction requirements, once adjusted to reflect the low-polluting nature of Windstone's sterilization process, will result in far less costly requirements, and avoid spending large sums on equipment and monitoring with negligible environmental and health benefits.

3. By the same token, an extension will provide more adequate time to implement carefully tailored EtO controls and allow expansion rather than contraction of surgical supply sterilization capacity. That expansion may help reduce hospital acquired infections (HAIs), a major public health challenge for the United States. In a peer-reviewed study, the CDC estimated that the United States suffers 99,000 deaths annually from HAIs.
   https://pmc.ncbi.nlm.nih.gov/articles/PMC3528178/#:~:text=The%20Centers%20for%20Disease%20Control,obtained%20from%20multiple%20healthcare%20databases.
   According to this peer-reviewed study, two of the four most deadly HAIs are surgical site infection and central line-associated bloodstream infection. Nearly half of

these HAIs in the study were multi-drug resistant, making surgical sterilization even more important than before such multi-drug resistance became so common.

4. Windstone submits that expanding effective surgical supply sterilization will help combat the substantial United States death and illness toll from HAIs. Reducing that toll of HAI deaths and illnesses is very much in the national security interests of the United States, within the meaning of Section 112(i)(4) of the Clean Air Act, 42 U.S.C. Section 7412(i)(4).

We appreciate the opportunity to present our case for an exemption and would be happy to discuss the details of our situation if necessary.

Regards,

Jeff Jensen

Re: Sterilizer Rule (89 FR 24090): Professional Contract Sterilization, Inc,

I write on behalf of Professional Contract Sterilization, Inc. to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

Professional Contract Sterilization, Inc. requests that the Presidential Exemption apply to the following facilities regulated by the Sterilizer Rule and all sources therein:

- 40 Myles Standish Blvd, Taunton MA 02780

Professional Contract Sterilization, Inc. requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);

- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. Professional Contract Sterilization, Inc appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

-Gary Cranston, President
Professional Contract Sterilization, Inc.

From: Kevin Wagner
To: AirAction
Subject: Presidential Exemption: Sterilizer Rule (89 FR 24090): All Sterigenics U.S., LLC-Owned and Operated Facilities
Date: Monday, March 31, 2025 10:52:56 AM

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

I write on behalf of Sterigenics U.S., LLC ("Sterigenics" or the "Company") to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 National Emissions Standards for Hazardous Air Pollutants: *Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24090 (Apr. 5, 2024), known as the "Sterilizer Rule."

Sterigenics requests that the President issue a two-year exemption as quickly as possible and designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule.

Specifically, for standards established or revised under CAA Section 112(f)—including all related requirements such as monitoring—the exemption should apply as of April 6, 2026, the compliance deadline for those standards.
The facilities and/or affected sources for which the Company is seeking a two-year exemption are:

2971 Olympic Industrial Dr SE Atlanta, GA 30339	10821 Withers Cove Park Drive Charlotte, NC 28278	1302 Avenue T Grand Prairie, TX 75050
4900 S Gifford Ave Los Angeles, CA 90058-2785	4801-63 E 50th Street Los Angeles, CA 90058-2709	687 S Wanamaker Ave Ontario, CA 91761
84 Park Road Queensbury, NY 12804	5725 Harold Gatty Dr. Salt Lake City, UT 84116	2400 Airport Road Santa Teresa, NM 88008

Sterigenics has consistently operated its ethylene oxide ("EtO") sterilization facilities with emission controls that meet or perform better than regulatory standards. Since 2019, the Company has proactively implemented additional enhancements to further reduce already negligible EtO emissions, pioneering many new EtO sterilization facility design features. These proactive initiatives have supported ongoing efforts to align with the final Sterilizer Rule requirements.

The Company is requesting this two-year exemption to facilitate an optimal installation and validation of the facility and emission control upgrades required under the Rule. The Rule's new requirements for existing critical healthcare infrastructure facilities have triggered major structural changes across emission control, process control and emission monitoring systems. Like others in the industry,

Sterigenics is constrained by the increasingly limited availability of specialized consultants, control and monitoring equipment, and qualified contractors. Supply chain delays, engineering complexity, and lengthy commissioning and testing periods are making it challenging and expensive to meet the Sterilizer Rule's deadlines.

Additionally, certain provisions in the Rule relating to continuous emission monitoring and secondary parameter tracking are adding unnecessary technical complexity, cost and system integration challenges without delivering meaningful emission reductions. Extending the timeline will allow Sterigenics during the exemption period to continue making thoughtful, proactive investments and focus resources on ensuring stable, reliable compliance.

Sterigenics provides FDA-required sterilization services critical to the U.S. healthcare supply chain. Given the tight implementation timeline and the constraints associated with deploying the required technology under the Sterilizer Rule, as well as the critical role these facilities play in supporting U.S. national security, the President has the authority to grant this requested relief.

If you have any questions about this exemption request, please contact me at kwagner@sterigenics.com. Sterigenics sincerely appreciates EPA's attention to this important matter and requests that the President issue the exemption as quickly as possible.

Re: Presidential exemption: Sterilizer Rule (89 FR 24090): All facilities owned by Cosmed Group, Inc., Jamestown, RI

Cosmed Group, Inc. (Cosmed) hereby requests that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

Cosmed requests that the requested Presidential exemption apply to the following facilities regulated by the Sterilizer Rule and all sources therein:

- Cosmed Group, Inc., d/b/a Cosmed of Pennsylvania , 2205 East 33rd Street, Erie, PA, FRS ID 110000332015
- Cosmed Group, Inc., d/b/a Cosmed of New Jersey, 19 Park Drive, Franklin, NJ, FRS ID 110070557911
- Cosmed Group Inc., 2500 Brunswick Avenue, Linden, NJ, FRS ID 110000318567

Cosmed requests that the President issue a two-year exemption as quickly as possible but designate the exemption as taking effect beginning on the compliance deadlines for the standards in the Sterilizer Rule.

Specifically, (1)
for standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards), and (2)
for standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

Cosmed conducts ethylene oxide sterilization operations at the facilities identified above and is a member of the Ethylene Oxide Sterilization Association (EOSA). As explained further in the attached

letter submitted to EPA on March 17, 2025 on behalf of the EOSA, the technology necessary to implement the standards set forth in the Sterilizer Rule is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards, there is not a sufficient supply of the necessary technology, and there are not enough experienced installation professionals and technical experts to install and test that equipment within the compliance timeframes specified in the Sterilizer Rule.

As also explained further in EOSA's March 17, 2025 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which seems likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please do not hesitate to contact us if additional information is needed. Cosmed appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

Subject:	Presidential Exemption: Ethylene Oxide Emissions Standards for Sterilization Facilities- National Emission Standards for Hazardous Air Pollutants (NESHAP): Arthrex Finishing Facility
Date:	Monday, March 31, 2025 12:19:55 PM
Attachments:	image001.png

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To Whom it May Concern:

Arthrex operates two co-located facilities in Ave Maria, Florida: Arthrex Manufacturing, Inc and Arthrex - Finishing Facility. Arthrex Manufacturing, Inc is located at 6875 Arthrex Commerce Drive and manufactures medical devices for minimally invasive surgical procedures. The Arthrex - Finishing Facility is located at 6861 Arthrex Commerce Drive and sterilizes the medical devices manufactured Arthrex Manufacturing, Inc. Arthrex – Finishing Facility uses 100% Ethylene Oxide (CAS 75-21-8) gas. Ethylene Oxide is a dependably documented method of sterilization especially suited for heat- or moisture-sensitive items such as medical devices and pharmaceutical products.

Due to the use of Ethylene Oxide, Arthrex adheres to the US EPA NESHAP Standards for Ethylene Oxide Emissions. This standard has established requirements that Arthrex has begun to move toward compliance. Of note, Arthrex has progressed through the design phase for the building infrastructure and equipment changes necessary to implement the standard at the Arthrex - Finishing Facility. Currently, Arthrex is applying for the permits required by both state and local regulatory authorities. Arthrex is simultaneously working towards sourcing the equipment (e.g., controls, HVAC) that will be required. However, Arthrex cannot confirm whether the equipment necessary to implement the standard will be available for purchase, qualified, and placed in operation prior to the overall compliance deadline. The reason for this uncertainty is based on the high demand of both the mechanical and controls equipment as well as the limited number of vendors capable of supplying this equipment (i.e., dry beds capable of treating low EO concentration emissions). Approximately 90 sterilization facilities in the United States are competing for limited vendors and equipment needed to comply with the new NESHAP standard requirements. This competition for limited vendors and equipment has made it difficult for Arthrex to envision completion of all the NESHAP requirements, validate the new processes, and to continue to sterilize crucial medical devices by the NESHAP deadline.

Based on the uncertainty and scarcity of equipment and vendors, Arthrex is respectfully requesting a two-year Presidential Exemption from the NESHAP standard which will allow additional time to complete the design, procure and install the necessary equipment, and validation.

By granting this Presidential Exemption, Arthrex will continue to provide surgeons

safe and effective medical devices to treat their patients as Arthrex continues to work toward implementing the requirements of the NESHAP Standard. Additionally, granting this two-year Presidential Exemption will allow Arthrex to continue to supply critical sterilize medical devices and not negatively impact the public health nor strain the healthcare system and ensure the national security interests of the United States.

Sincerely,

Scott M Beauchesne, *PE, CSP*
Process Safety Engineer (EH&S)

Re: Cook Incorporated Ellettsville North (6300 N. Matthews Dr., Ellettsville, IN)
Presidential Exemption Request: National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review

Emissions standards or limitations subject to the request

I write on behalf of Cook Incorporated ("Cook") to request that the President of the United States issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in the U.S. Environmental Protection Agency's final rule *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg 24,090 (April 5, 2024) ("Sterilizer Rule").

Facility(ies) and/or affected source(s)

Cook makes this request for its facility located at 6300 N. Matthews Dr., Ellettsville, Indiana ("Ellettsville North"), currently permitted under Indiana Department of Environmental Management air permit No. 105-44622-00030.

Length of compliance period being requested.

Cook requests that the President issue a two-year exemption as quickly as possible, but designate the exemption as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), Cook requests that the exemption should apply as of April 6, 2026 (the compliance deadline for those standards); and
- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), Cook requests that the exemption should apply as of April 5, 2027 (the compliance deadline for those standards).

Justification

Clean Air Act ("CAA") Section 112(i)(4) vests the President with significant authority to exempt "any stationary source" from "any standard or limitation under this section." The President may do so if he determines: (1) "that the technology to implement such standard is not available" and

(2) that the exemption is "in the national security interests of the United States." Cook respectfully requests expedited review of this exemption request due to the quickly approaching Sterilizer Rule deadlines. Although the deadline for compliance is about a year away (April 6, 2026) for certain aspects of the Sterilizer Rule, the requirements of the rule necessitate significant capital expenditures and other operating changes that have a very lengthy planning and construction time horizon.

The Sterilizer Rule specifically contemplated relief under the Presidential Exemption "if more time is needed to comply with any standard in this final rule." 89 Fed. Reg. 24,103. Cook believes the Sterilizer Rule is ripe for an exemption under 42 U.S.C. § 7412(i)(4) as the emissions standards and monitoring requirements create a heavy burden with minimal time to comply. In other words, more time is needed to comply with the Sterilizer Rule.

I. Availability of Technology

The Ethylene Oxide Sterilization Association, Inc., a non-profit group of which Cook is a member, recently sent a letter to EPA on behalf of the industry requesting that the President grant a two-year compliance exemption. This correspondence is attached hereto as Exhibit A and is incorporated by reference into this request. As explained further therein, the technology necessary to implement the Sterilizer Rule standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

It is important to note that the *availability* of technology is not the same as *existence* of the technology. EPA itself has various definitions for whether a technology is "available." *See California Communities Against Toxics v. Env't Prot. Agency*, 934 F.3d 627, 632–33 (D.C. Cir. 2019) (comparing GACT and MACT standards) *and Nat. Res. Def. Council v. E.P.A.*, 571 F.3d 1245, 1252 (D.C. Cir. 2009) (analyzing RACT standards). Given the broad language of 42 U.S.C. § 7412(i)(4), the President has discretion to determine whether the technology mandated by the Sterilizer Rule is truly *available* in light of the arguments made in Exhibit A.

Also, some of the Sterilizer Rule's emissions standards involve vanishingly low concentrations of ethylene oxide. For instance, the Rule's emission reduction standards for fugitive emissions seemingly request reductions of single-digit parts per billion concentrations by as much as 98%. Detecting single-digit parts per billion concentrations of ethylene oxide is already state of the art technology. Detecting 50-fold reductions from that number on a continuous basis as required by the Rule is not feasible.

II. National Security Interests

The durability of the medical device supply chain is of vital importance to national security. Given this national security interest, the U.S. Food & Drug Administration continues to closely monitor potential supply chain interruptions, including by working with industry on critical issues such as sterilization. *See, e.g.,* U.S. FDA, Supply Chain: FDA's Role, https://www.fda.gov/emergency-preparedness-and-response/supply-chain/supply-chain-fdas-role (last visited March 28, 2025).

As such, Cook incorporates by reference the section in Exhibit A related to national security and supply chain disruption. As explained further therein, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad. These ideas are echoed by Indiana Senator Todd Young, who authored a letter to the EPA when the Sterilizer Rule was first proposed by the agency:

> "The potential for extensive disruption in our medical device supply chain is evident, which could instigate a public health crisis of unprecedented scale. As noted by FDA, 'EtO facilities in the United States typically run 24/7 with facilities operating at maximum capacity. Thus, when EtO facilities close (even temporarily), there are downstream implications for the medical device supply chain.'" Comment submitted by Senator Todd Young (August 14, 2023) *available at* https://www.young.senate.gov/wp-content/uploads/imo/media/doc/epa_comment_letter.pdf.

* * *

Cook appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible. If any additional information is needed regarding this request, please do not hesitate to contact me.

Sincerely,

Gene Baker
General Manager and Vice President
Cook Inc.

EOSA **The Ethylene Oxide Sterilization Association, Inc.**
Managed by B&C® Consortia Management, L.L.C.

The Honorable Lee Zeldin
Administrator
Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Mail Code: 1101A

Dear Administrator Zeldin:

I write on behalf of the Ethylene Oxide Sterilization Association (EOSA) to ask EPA to take near-term action regarding the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24090 (Apr. 5, 2024), known as the "Sterilizer Rule." The Sterilizer Rule imposes extremely onerous ethylene oxide (EtO) emission standards on medical device sterilizers—the most stringent of which must be met by April 2026—and is causing substantial harm to and regulatory uncertainty for EOSA's members.

EPA announced on March 12, 2025, that it will reconsider the Sterilizer Rule (alongside other NESHAPs), which is a welcome development. EOSA was also pleased to see EPA's statement that the Administration "is considering a 2-year compliance exemption via Section 112(i)(4) of the Clean Air Act for affected facilities while EPA goes through the rulemaking process." But medical device sterilizers need to decide *now* whether to expend substantial resources to acquire technology and reconfigure their facilities to try to comply with the Sterilizer Rule—or to instead cease operations. That, in turn, may disrupt the supply of critical medical devices, harming both patients and providers, or force medical providers to source those essential medical devices from abroad—increasing the offshoring of the sterilization of medical devices and inflating costs to Americans in direct contravention of the Trump administration's economic objectives.

The Sterilizer Rule was promulgated by the Biden administration under Clean Air Act ("CAA") Section 112 on April 5, 2024. The Sterilizer Rule includes standards set under Section 112(d), the CAA's hazardous pollutant "technology review" provision, and Section 112(f), the "risk review" provision, the latter of which the D.C. Circuit described as a "*one-time* 'risk review.'" *Nat'l Ass'n for Surface Finishing v. EPA*, 795 F.3d 1, 5 (D.C. Cir. 2015) (emphasis added). There are several major flaws in the Sterilizer Rule, and a litany of other issues and errors.

First, the Sterilizer Rule unlawfully set new standards under Section 112(f) even though EPA previously undertook the one-time risk review for this source category in 2006. 71 Fed. Reg. 17, 712, 17,716 (April 7, 2006). In doing so, EPA ignored the statutory text and context, both of which indicate that Congress intended EPA to regulate primarily through periodic technology reviews under Section 112(d) and conduct only one round of risk-based review under Section 112(f). By ignoring that Congressional mandate, EPA wrongly avoided Section 112(d)'s requirement that the agency must consider costs when setting and revising technology-based standards.

Second, the emission standards set in the Sterilizer Rule particularly under Section 112(f), but also those set under Section 112(d)—are extremely onerous, unsupported by the record data, and for some sterilizers will be impossible to meet. For example, EPA increased the standard for sterilization chamber vents using at least 30 tons per year ("tpy") of EtO from a 99% destruction

ED_021114D_00003015-00001

and removal efficiency (DRE) standard to a 99.99% DRE standard. This leaves no margin for error or equipment malfunction. Likewise, for aeration room vents ("ARVs") using at least 30 tpy of EtO, the Sterilizer Rule increased the DRE requirement from 99% to 99.9%, while wrongly rejecting commenters' request for an alternative standard. Both the SCV and ARV standards were premised on test data that EPA admitted, in the Proposed Rule, is not representative of normal operations. *See* 88 Fed. Reg. at 22,844. EPA also imposed stringent new standards on area sources; for example, EPA set a chamber exhaust vent emission standard of 99.9% DRE for facilities using at least 60 tpy of EtO. These are just a few of the stringent standards set in the Sterilizer Rule under Sections 112(f) and (d), all of which are unrealistic and unsupported by the record.

The Sterilizer Rule is also flawed because EPA arbitrarily and capriciously imposed onerous Continuous Emission Monitoring System (CEMS) mandates on facilities using at least 100 lb/year of EtO without proper notice and comment. Replacing parametric monitoring with CEMS, operating at fifteen-minutes intervals and demonstrating 90% data availability, is costly, complicated, and burdensome, while emission reduction benefits are minimal. Further, EPA failed to allow commenters to weigh in on the CEMS scheme the agency finalized, which requires application of CEMS *at each emissions inlet*, not just outlets. This CEMS scheme is thus both arbitrary and unlawful.

EOSA challenged the Sterilizer Rule in the United States Court of Appeals for the District of Columbia Circuit (No. 24-1180). In addition to raising the above major concerns, EOSA also explained that EPA wrongly set standards based on EtO *usage*, rather than based on EtO *emissions* (as the text of Section 112 requires); failed to establish technology-based standards under Section 112(d) before imposing certain of the risk-based standards; failed to consider and address comments on EPA's reliance on the flawed IRIS value for EtO; and failed to conduct rational cost/benefit analysis in deciding whether and to what extent to revise all standards. A fuller discussion of all of these issues can be found in EOSA's opening merits brief (Doc. #2080994).

As noted above, EPA has announced it will reconsider the Sterilizer Rule. EPA also recently moved to hold the litigation over the Sterilizer Rule in abeyance for 60 days "to allow new Agency leadership to review" the Sterilizer Rule and "to decide what action, if any, is necessary." *Cal. Cmtys. Against Toxics v. EPA*, No. 24-1178 (D.C. Cir. filed Feb. 18, 2025) (Doc. 2101209). EOSA appreciates EPA's recognition of the need to reconsider the Sterilizer Rule. But while EPA does so, EOSA's members continue to face the Sterilizer Rule's fast-approaching compliance deadlines: April 6, 2026, for standards set under Section 112(f) and April 5, 2027, for standards set under Section 112(d). These deadlines (particularly the former, which applies to the most stringent standards) require sterilizers to decide now whether to commit significant financial and operational resources—including to purchase new control technologies, redesign facilities, and restructure operations to try to comply with the Sterilizer Rule, which is not possible for all facilities.

Lending further urgency to EPA's reconsideration of the Sterilizer Rule and the standards and deadlines set therein, the D.C. Circuit denied EPA's abeyance motion and the case has been set for argument on April 15, 2025. EOSA therefore urges EPA to act quickly to relieve sterilizers of the Sterilizer Rule's obligations, preventing unnecessary expenditures—and irrevocable decisions that some sterilizers will likely be forced to make absent near-term relief.

To address the urgent compliance challenges posed by the Sterilizer Rule, EOSA identifies two potential pathways for relief. Ideally, EPA should pursue both to ensure that sterilizers can continue to operate in the near term, even while EPA reconsiders the Sterilizer Rule more broadly.

Path 1: Presidential Waiver under Section 112(i)(4)

As suggested by EPA, the President should exercise his authority under CAA § 112(i)(4) to grant a two-year compliance exemption commencing on the Sterilizer Rule's compliance deadlines: April 6, 2026, for risk-based standards and April 5, 2027, for technology-based standards. The President may grant such an exemption for all sources regulated by the Sterilizer Rule in one action,[1] based upon findings that (1) "it is in the national security interests … to do so" and (2) "the technology to implement such standard is not available." 42 U.S.C. § 7412(i)(4).

The first requirement—national security interests—is satisfied due to the critical role that sterilization facilities play in maintaining the U.S. medical device supply chain. Compliance with the Sterilizer Rule's deadlines, particularly the two-year deadline for compliance with the risk-based standards set under Section 112(f), will significantly reduce sterilization capacity. This, in turn, will lead to severe shortages of life-critical medical devices such as catheters, surgical kits, syringes, bandages, IV equipment, and needles, disrupting essential healthcare services. EOSA cautioned in its Comments on the Proposed Sterilizer Rule that the loss of capacity while facility reconstruction and modifications are underway will cause "a large reduction in medical device sterilization capacity and a severe shortage of sterilized medical devices." EOSA Comments 59, EPA-HQ-OAR-2019-0178-0618. Medical industry stakeholders similarly noted that modifying sterilization equipment is "no trivial matter":

> These complex facilities, no two of which share the same design or process, typically must go at least partially offline to make modifications to the equipment. Even routine maintenance or periodic upgrades require significant planning to minimize downtime across the monthly or annual supply cycle.

Advanced Medical Technology Association Comments 9–10, EPA-HQ-OAR-2019-0178-0601.

Without relief, sterilizers may be unable to meet demand for sterilized medical devices, leading to shortages that force medical providers to seek alternative sources abroad and increase the United States' dependence on foreign suppliers for essential medical devices. This growing reliance on foreign sterilization capacity and imported medical equipment poses an immediate national security risk, as any disruption—whether from geopolitical conflicts, trade restrictions, or economic coercion—could severely limit the United States' ability to maintain an independent and resilient healthcare system, jeopardizing timely access to life-saving medical equipment.

---

[1] Nothing in Section 112(i)(4) bars the President from issuing an exemption that applies to all regulated sources—and the President should do so here to ensure that all sterilization facilities are relieved from the obligation to comply with the Sterilizer Rule.

The second requirement – technology unavailability – is also met. It will be impossible for all regulated sources to obtain and install necessary control technology by April 2026 due to the limited number of equipment manufacturers and workforce shortages.

EOSA has explained that many of the Sterilizer Rule's requirements "require significant facility reconstruction and major equipment procurement and installation" that could take years – particularly if all sterilizers must redesign their facilities and install equipment to meet the new standards at the same time. EOSA Comments 58–59. And "[t]he availability of the equipment, materials, and contractor services necessary to modify emission control systems is severely limited." Sterigenics Comments 28, EPA-HQ-OAR-2019-0178-0632. Between supply chain constraints, the time-intensive process of facility redesign to accommodate new equipment, and the extensive testing and validation required before any system can become operational, the necessary control technology is functionally unavailable within the required timeframes.

Further, even if it were possible for all facilities to secure the needed equipment and make the necessary design and structural changes within the current compliance periods, the limited number of experienced installation professionals and technical experts who support this industry makes timely compliance by all regulated sources logistically infeasible. *See* AdvaMed Comments at 10. There is simply no way that all regulated sources will be able to obtain both the necessary equipment *and* the skilled technicians needed to successfully install, test, and bring that equipment online within the same two-year period, as required under the Sterilizer Rule.

Finally, control device manufacturers cannot guarantee that their equipment will operate to meet the Sterilizer Rule's stringent performance deadlines. *See* Sterigenics Comments at 28. This further highlights the technological infeasibility of meeting the current compliance deadlines – as well as the irrationality and infeasibility of the standards themselves. This is a particularly compelling basis for the President to find that "the technology to implement such standard is not available," 42 U.S.C. § 7412(i)(4), and grant a two-year waiver.

Even the Biden Administration recognized the compliance challenges posed by the Sterilizer Rule. In its *Memorandum on the Orderly Implementation of the Air Toxics Standards for Ethylene Oxide Commercial Sterilizers* (Jan. 16, 2025), the Administration acknowledged that waivers or exemptions may be necessary to "achiev[ing] the … Rule's critical health protections as soon as practicable, while safeguarding the supply of safe medical products from disruption that would compromise the health and welfare of the American people."

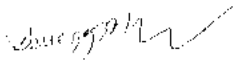
EPA should therefore urge President Trump to exercise his authority under Section 112(i)(4) and quickly issue a two-year compliance exemption for all sources regulated under the Sterilizer Rule, effective when each set of standards set therein would otherwise apply. The exemptions then may be extended for one or more additional periods, if necessary.

Path 2: EPA Rulemaking to Stay or Extend Deadlines

Also or alternatively, EPA should take a near-term discrete administrative action to rescind the Rule 112(f) risk-based standards, or at least stay the compliance deadlines, based on a finding that the standards are likely unlawful and EPA's stated commitment to reconsider the Sterilizer Rule.

Because Section 112(f) allows EPA to grant no more than two years for compliance with risk-based standards (although, as discussed above, the President may issue a further two-year exemption—and should do so here), EPA should take near-term, discrete administrative action to rescind at least the risk-based standards set in the Sterilizer Rule based on a finding that its reliance on Section 112(f) to revise EtO emission standards was unlawful. EPA has a solid basis for taking that initial step now: under the Biden Administration, EPA ignored the statutory text and context, both of which confirm that the risk-review is (as the D.C. Circuit previously stated), a "one-time" event, and therefore EPA's conduct of a second risk review was unlawful.

Alternatively, EPA could take a discrete administrative action to stay the Sterilizer Rule's compliance deadlines (ideally for all standards, but at least the Section 112(f) risk-based standards) pending completion of reconsideration and a new notice-and-comment rulemaking process to rescind, replace, or revise the Sterilizer Rule. Such action would relieve sterilizers of near-term compliance obligations and reduce the risk that many sterilizers will cease operations and thereby disrupt the supply of medical devices even while EPA is reconsidering the Sterilizer Rule.



Because the Sterilizer Rule is the result of a notice-and-comment rulemaking process, rescinding or revising the Sterilizer Rule—or even just staying the compliance deadlines—likely also requires rulemaking to minimize the chance that a reviewing court vacates such action. But EPA could invoke the Administrative Procedure Act's "good cause" exception to notice and comment because the key legal issue whether EPA can conduct a second round of risk review for a source category has already been subject to a notice-and-comment process, and it is a pure statutory construction question on which EPA can correct course now. Further notice-and-comment on that issue is thus "unnecessary," and it is also "impracticable" and "contrary to the public interest" given the urgency of the issue and the impact on the medical device supply chain. *See* 5 U.S.C. 553(b)(B). Or, EPA could issue an interim final rule rescinding at least the Section 112(f) standards and thereby obviating the nearest-term compliance deadlines. This option would allow further notice and comment, but still provide immediate relief for sterilizers facing the difficult choice whether to try to comply with the Sterilizer Rule—despite the near-impossibility of doing so—or cease operations and disrupt the domestic medical supply chain.

* * * *

EOSA appreciates EPA's commitment to reconsidering the Sterilizer Rule and addressing the concerns of regulated facilities. EOSA also appreciates the Agency's willingness to consider near-term actions, such as a Presidential exemption and/or discrete administrative action to address the Section 112(f) standards and associated compliance deadlines. As many facilities confront immediate investment decisions, regulatory clarity is essential. EOSA urges EPA to take timely action to ensure that sterilization facilities remain operational while advancing long-term regulatory solutions that balance public health objectives with industry feasibility.

Thank you for your consideration. Please feel free to contact me at mzhuang@bc-cm.com if you have any questions regarding this request.

Sincerely,

Meibao Zhuang

Presidential Exemption: National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" (89 FR 24090; April 5, 2024) (Sterilizer Rule): Fuchs North America

Fuchs North America ("Fuchs") is a seasoning and spice company located in Hampstead, Maryland. As part of our manufacturing process, Fuchs uses ethylene oxide ("EtO") as a fumigant to ensure that our spices meet Food and Drug Administration ("FDA") standards, 21 CFR 117. EtO is highly effective and validated to kill the pathogen, *Salmonella*. Fuchs's products are treated with EtO in an enclosed chamber using a programmed cycle of EtO treatment, followed by nitrogen and air washes that are intended to reduce the amount of EtO residual left on the product. The Human Exposure Model (HEM4) was used in July 5, 2022 to estimate the potential cancer risk from EtO for up to 10 kilometers from the Fuchs Hampstead facility and the results were less than 3.2 in one million.

We are requesting a Presidential Exemption for the Sterilizer Rule 89 FR 24090. The technology to implement the capture requirements and continuous emission monitoring system (CEMS) is currently not available due to 1) Engineering Time and 2) Lack of Equipment.

1) Additional Engineering Time Needed

   The capture requirements associated with the emission reduction standards for Group 1 and Group 2 room air emissions in the final rule requires a redesign of the facility. There are a limited number of vendors that specialize in the redesign of facilities to be compliant with the permanent total enclosure (PTE) requirements. Sufficient time is needed to design and plan before the permit applications are submitted.

2) Lack of Equipment Obstacle

   Additional equipment needs to be purchased and installed (e.g., fans, transformers, variable frequency drives, etc.) to meet the capture requirements. As well as additional CEMS equipment. There are a limited number of control technology vendors that supply the types of advanced control systems that are necessary for facilities to comply with the final standards. Additional time is needed to ensure our company can receive the necessary services and have the proper equipment in place by the compliance date.

An extension is also in the national security interests of the United States as there are currently no effective alternative treatment methods for certain spices and spice-related categories.

EtO is needed to ensure food safety and avoid spice shortages.

While alternative technologies are available for some applications of spices, EtO remains critical for the spice industry. Some spices are particularly vulnerable to alternative treatments due to having more delicate flavor and color. Steam is particularly challenging for use with low density products such as herbs, and spice products with a high density, such as ground spices and cannot be used for pre packaged spice. Steam treatment can also result in discoloration or loss of flavor, thus destroying certain spice products – for which the main purpose is to add flavor to foods. Another potential alternative — gamma — comes with issues. Because of world-wide shortages of cobalt, there is very low availability.

Shutting down EtO sterilization until the facilities are in compliance with the new standards of the Sterilizer Rule could push much of the spice sterilization offshore to developing countries with far less sophisticated regulatory systems than the U.S., which presents both significant food safety and environmental risks.

An additional two years is needed to comply with the standard in the 89 FR 24090 Sterilizer Rule.

In summary,

- Fuchs use of EtO is safe for food, the environment, our employees and our community through following established use requirements already established by Federal and State agencies for the use of EtO on spices.
- Presidential Exemption is requested due to insufficient capacity to sterilize our raw materials through alternative means, greatly affecting our ability to serve our customers and consumers with safe food.

We appreciate you taking the time to consider our request for Presidential Exemption and two year extension.

FINAL EOSA Letter to EPA re. NESHAP -- March 17, 2025.pdf

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To: airaction@epa.gov

Re: Sterilizer Rule (89 FR 24090): KPR US, LLC d/b/a Kendall Patient Recovery ("KPR")

I write on behalf of KPR to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

KPR requests that the Presidential Exemption apply to the following facility regulated by the Sterilizer Rule and all sources therein:

- KPR US, LLC d/b/a Kendall Patient Recovery
  1430 Marvin Griffin Road, Augusta, Georgia 30906

KPR requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);
- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not widely available to the sterilization industry because: manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. KPR appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

Thanks you for your considersation of this matter,

Arthur

Re: Presidential Exemption: *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24,090 (Apr. 5, 2024): ALCON Research Ltd., ALCON Advance Optic Device Center, North Facility, 2 Vision Lane, Lesage, Cabell County, West Virginia 25537

Dear Administrator Zeldin:

ALCON Research Ltd.'s ALCON Advance Optic Device Center, North Facility located at 2 Vision Lane, Lesage in Cabell County, West Virginia (AODC) respectfully requests a two-year Presidential Exemption from the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review* regulation, published at 89 Fed. Reg. 24,090 (Apr. 5, 2024) (EtO NESHAP Rule).

The Emissions Standards or Limitations Subject to the Request:

National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, published at 89 Fed. Reg. 24,090 (Apr. 5, 2024), and 40 C.F.R. Part 63, Subpart O. The limitations that are the subject of this exemption request include the emission standards and emission capture requirements applicable to sterilization chamber vents, aeration room vents, Group 1 Room emissions, and Group 2 Room emissions, the Permanent Total Enclosure (PTE) requirements of EPA Method 204 of Appendix M, 40 C.F.R. Part 51, and the requirement to install and operate

Continuous Emission Monitors (CEMs) in accordance with the requirements of Performance Specification 19 in Appendix B and Procedure 7 in Appendix F to 40 C.F.R. Part 60, all as applied at AODC.

Exemption Period Request:

ALCON Research, Ltd., is requesting a two-year Presidential Exemption and extension of the applicable compliance deadlines of the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review* regulation, published at 89 Fed. Reg. 24,090 (Apr. 5, 2024), as applied at AODC.

Background

Founded more than 75 years ago in Fort Worth, Texas, ALCON is the largest eye care company in the world. It is the global leader in eye care, dedicated to helping people ***See Brilliantly***. Today, more than one billion people live with some form of uncorrected visual impairment. The impact of these treatable problems is significant. We see a world where treatable, preventable eye health conditions receive the attention they need, regardless of an individual's geography, gender, age or socioeconomic status. Our Social Impact and Sustainability strategy is focused on three pillars Brilliant Lives, Brilliant Innovation and Brilliant Planet. The pillars include social impact and environmental goals that hold us accountable and measure progress. ALCON is dedicated to advancing a future where the opportunity to protect, restore or enhance vision is available to everyone, including our U.S. military and military veterans.

In 2024 alone, ALCON sold more than 52,000 vision correction lenses to the U.S. Department of Defense and other U.S. government entities through government contracts. Alcon's commitment to the United States and its local communities is illustrated by ALCON's Children Vision Program a program that works with local school districts to provide no-cost comprehensive exams and glasses for students. As part of this program, ALCON AODC provides free vision screenings for students in Cabell County, West Virginia, including 2,472 student screenings in 2024 alone.

The ALCON AODC North Facility is located on a 21-acre industrial park in a rural community, surrounded by industry, a sewer plant, and warehouses. It is located adjacent to what will become an ALCON warehouse at 1 Vision Lane which is located on a separate 26-acre parcel. The ALCON AODC North Facility manufactures Intraocular Lenses (IOLs) and IOL delivery devices. An IOL is a tiny, artificial lens for the eye, which replaces the eye's natural lens that is removed during cataract surgery. ALCON's IOL portfolio reflects a strong legacy of eye care innovation based on ALCON's significant strategic commitment to research and development.

Presidential Exemption Request

A. AODC's Current Sterilization Process Is Uniquely Designed to Minimize Ethylene Oxide Emissions

As surgical implantable devices, IOLs must be carefully sterilized. The ALCON AODC facility is an existing minor source facility which operates three (3) identical EtO sterilization chambers that are uniquely designed to minimize EtO emissions generated during the sterilization process. IOLs are sterilized in these chambers inside their primary Tyvek pouch packaging, using metal racks with three (3) plastic pallets per chamber. Unlike many EtO sterilization facilities, no cardboard or paper is used in AODC's sterilization process, which reduces residual EtO emissions after sterilization. Loading and unloading for each sterilization chamber is also automated, reducing potential employee exposure to EtO.

After sterilization, the IOLs (in their primary Tyvek pouch packaging) are transferred by enclosed mechanized conveyer into a 24-hour aeration chamber. The facility utilizes a Lesni Abatement Plant (water balancer and catalytic oxidizer) to treat the sterilization chamber vents (SCVs) and aeration room vents (ARVs). The facility has no chamber exhaust vents (CEVs). The aeration cells utilize exhaust air from the unloading area for makeup, and the aeration cell vents are routed to a low concentration inlet of the Lesni Abatement Plant. Both vent sources are routed through a single stack to the atmosphere.

After aeration, the IOLs are transported to a final Packaging and Labeling Area, where they are placed into cartons with tamper seals and placed in shipper boxes. Most commercial sterilizers sterilize products in their final packaging, which includes a lot of materials that will retain EtO and create longer aeration and/or more fugitive off-gassing downstream in trucks and distribution warehouses. AODC's sterilization process is uniquely designed to reduce aeration time and fugitive emissions in the off-gassing process thereby reducing emissions and risks to public health.

B. AODC's Current Ethylene Oxide Process Controls Are Already Highly Effective

At the present time, the ALCON AODC facility uses less than five tons of EtO on an annual basis. Moreover, the unique design of AODC's sterilization process is highly effective at reducing EtO emissions.

Total emissions from the AODC facility after existing controls already meet the requirements of the pre-2024 NESHAP regulations. Stack tests were conducted in 2019 by ALCON on the Lesni Abatement Plant stack and observed by the West Virginia Department of Environmental Protection, Division of Air Pollution Control. During the most recent testing, the Lesni Abatement Plant achieved an average destruction and removal efficiency (DRE) that exceeded 99.8%. Consequently, EtO stack emissions at AODC are extremely low. ALCON has been in

continuous compliance with the pre-2024 NESHAP regulations and has never been cited for violations of the applicable regulations.

AODC also engaged the leading provider of enhanced optical spectroscopy analytical solutions to conduct an Ethylene Oxide Workplace Exposure Site Evaluation between August 12 and September 6, 2024. The independent assessment company conducted continuous sampling at 17 locations throughout the facility over 26 days utilizing a Workplace Monitoring System (WMS). During the period of analysis, no position within the facility exceeded a 1ppm/8hr time-weighted-average (TWA) permissible exposure limit (PEL) under normal conditions. The largest 8hr TWA was 0.139 ppm. The same company noted in its final report that the EtO sampling recorded values at AODC were the **lowest** they had seen in any facility based on their extensive monitoring experience.

In addition, the EPA evaluated the cancer maximum individual risk (MIR) from ALCON's AODC facility in January 2024. *See Residual Risk Assessment for the Commercial Sterilization Facilities Source Category in Support of the 2024 Risk and Technology Review Final Rule* at Table 2a-1. The facility-wide cancer MIR for AODC in the EPA's evaluation was very low at 0.2-in-1 million **far below** the 1-in-1 million cancer risk the EtO NESHAP Rule sets as a target.

C. Challenges Presented by the EtO NESHAP Rule

The April 5, 2024, EtO NESHAP Rule presents many technological, engineering and business challenges for ALCON. To comply with this revised rule, ALCON continues to research, design, plan, and consider: (1) product disruptions, (2) capacity reductions, (3) alternative compliance options such as off-shoring production, or out-sourcing sterilization, (4) development of new engineering design plans, and (5) vendors to provide the required PTE, CEMs, and new control systems.

The first three options for AODC compliance with the EtO NESHAP Rule product disruptions, capacity reductions, or off-shoring / out-sourcing production — are problematic for the domestic and national security reasons discussed below.

1. Limitation of Technology and Expertise

ALCON continues to research technologies and suppliers to achieve the applicable NESHAP requirements without negatively impacting its IOL manufacturing at the AODC facility. This research and review has included contacting engineering firms familiar with designing sterilization facilities and Method 204 compliant PTEs and reaching out to current abatement and EtO monitoring vendors, colleagues in the industry, and trade organizations.

As the April 5, 2024, EtO NESHAP Rule recognizes and acknowledges, there are limited vendors with the technology and expertise to plan, design, and install the PTEs, the air pollution controls, and the CEMs that are required by the 2024 EtO NESHAP Rule. *See* General Information at 89 Fed. Reg. 24090, 24102. ALCON has and continues to expend significant resources in an attempt to comply with the Rule. ALCON has held onsite meetings and demonstrations with several vendors of CEM equipment that advertise technology meeting the NESHAP requirements as well as experienced engineering design firms. ALCON has approved and expended significant Capital funding for a multi-disciplinary design firm to conduct the following for the AODC facility:

- An EPA Compliance Assessment to understand the NESHAP applicability to current operations and recommended options for compliance based on the facility's unique layout and challenges.

- An onsite 25-day EtO Monitoring Study using industry-approved cavity ring-down spectroscopy technology. This study was selected to better understand the fugitive emissions in Group 1 and Group 2 rooms as well as to afford the site with the opportunity to become familiar with the vendor and their equipment.

- A Basis of Design (BOD) study for the Method 204 PTE of Group 1 and Group 2 Rooms and the Dry Bed Abatement Facility required to support the PTE abatement exhaust.

- Develop a Rough Order of Magnitude (ROM) Budgetary Cost Estimate for the project.

2. Threat to Sterilization and Quality Control

Through this design process, ALCON has determined that compliance with the EtO NESHAP Rule threatens the integrity of AODC's sterilization and quality control process. Particulate (dust, hair, etc.) in the final packaging for an implantable medical device is a major risk. To minimize this risk, AODC maintains positive air pressure in its final Packaging and Labeling Area. However, this area is a Group 2 Room that would be required to be converted to a PTE under the revised EtO NESHAP Rule. Converting this area to a PTE would create a negative air flow into the Packaging and Labeling Area from surrounding rooms (including the facility's main hallway) and potentially contaminate the final packaging for the IOLs.

3. Inability to Meet Deadline Coupled with Uncertainty

Despite ALCON's extensive efforts to find cost-effective solutions to comply with the EtO NESHAP Rule, based on the studies and efforts provided above, the estimated cost for AODC to achieve compliance with the Rule at its current EtO usage is greater than 15% of ALCON AODC's annual operating budget, which is more than 50 times EPA's woefully underestimated cost of compliance for the facility. This exorbitant cost to achieve compliance is particularly

challenging given the controversy and litigation surrounding the new EtO NESHAP Rule. As EPA is aware, EPA announced on March 12, 2025, that it would reconsider the new EtO NESHAP Rule as part of a broader deregulatory initiative mandated under Executive Orders signed by President Donald Trump. The U.S. Court of Appeals for the District of Columbia has also scheduled oral arguments to hear from multiple parties challenging the EtO NESHAP Rule. The Executive Orders, the EPA deregulatory announcements, the ongoing EtO litigation, and the difficulties with timely obtaining an assured supply of technologies and expertise have created fundamental uncertainty as to the scope, timing, and content of compliance requirements. This creates significant uncertainty for companies like ALCON that would need to deploy significant resources to attempt to comply with the Rule without reducing or off-shoring production.

Moreover, and more importantly for its purposes, despite ALCON AODC's significant efforts to achieve compliance with the April 5, 2024, EtO NESHAP Rule requirements in a timely manner, ALCON is not able to identify and implement technology that will serve its unique needs by the compliance deadlines for the new EtO Rule. For the reasons discussed above (as well as others discussed below), ALCON's AODC facility requests a two-year exemption from the April 5, 2024, EtO NESHAP Rule, as provided for in Section 112(i)(4) of the Clean Air Act.

D. National Security Implications of Compliance with the EtO NESHAP Rule

As a global and world class leading producer of IOLs, it is extremely important that ALCON continue to produce high-quality cataract replacement lenses. Indeed, the ability of ALCON to produce IOLs is in the national security interests of the United States for several reasons. ALCON supplies 56% of the US IOL market and 32% of the global IOL market. Cataract surgery is one of the most frequently performed surgical procedures. According to the National Eye Institute, cataracts are the leading cause of blindness worldwide even though effective surgical treatment exists. Currently, surgical removal of the clouded lens followed by insertion of an IOL is the preferred treatment for cataracts. The clouded lens is usually removed through a process known as phacoemulsification. During phacoemulsification, an ophthalmic surgeon makes a small surgical incision in the cornea (approximately 2-3 millimeters wide) and inserts an ultrasonic probe that breaks up, or emulsifies, the clouded lens while a hollow needle removes the pieces of the lens. Once the clouded lens is removed, the surgeon inserts an IOL through the same surgical incision. An Advanced Technology IOL (ATIOL) is a type of IOL that also corrects for refractive errors, like presbyopia and astigmatism. ALCON's AODC facility in West Virginia reduces potential American dependency on imports of IOLs.

In addition to the eye care health crisis potentially associated with IOL product disruptions due to vendor delays, longer production times, packaging modifications, and/or production shutdowns for facility modifications, the United States global leadership in IOLs is a contributor to the economic stability of this country. It is important that the United States maintains its global leadership in R&D and in advanced manufacturing. ALCON is on the cutting edge of these initiatives in the eye care industry and maintaining and improving the U.S. eye care market

contributes to the economic stability of the United States. The economic stability of the United States is in the country's national security interests.

Beyond the economic stability justifications for ALCON's contributions to our nation's national security, ALCON also supplies U.S. military personnel and military veterans with cataract replacement lens. In 2024 alone, ALCON sold more than 52,000 vision correction lenses to the U.S. Department of Defense and other U.S. government entities through government contracts. The Defense Health Agency's Vision Center of Excellence (VCE) reports that military service members are more prone to traumatic eye injuries, with 68% occurring on the battlefield and 28% during noncombat work and training. These injuries, often blunt or penetrating, frequently require IOLs for sight-restoring cataract surgeries. In addition to supporting active duty members, the U.S. Department of Veteran Affairs commonly covers, provides, and performs cataract surgery for qualifying veterans. AODC should be permitted to continue manufacturing and sterilizing high-quality cataract replacement lenses for the U.S. military and military veterans.

Conclusion

Despite its significant efforts to achieve compliance with the April 5, 2024, EtO NESHAP Rule requirements in a timely manner, ALCON is not able to obtain and install the technology required by the new Rule by the compliance deadlines. Attempting to comply with the new Rule would result in several months of manufacturing shutdowns, product shortages, capacity reductions, and the need to explore out-sourcing sterilization of IOLs to reduce EtO usage. This would negatively impact national security by affecting U.S. military and veteran use of IOLs produced at the AODC facility, as well as the stability of U.S. markets, and potentially leave multiple millions of Americans in the general population dependent on imported IOLs for their sight. For these reasons, ALCON Research Ltd., requests a two-year exemption from the April 24, 2024, EtO NESHAP, as provided for in Section 112(i)(4) of the Clean Air Act.

In addition to the federal regulations, the April 5, 2024, EtO NESHAP has been adopted by reference at W. Va. Code R. § 45-34, as a federal counterpart regulation, in accordance with W. Va. Code § 22-5-4. Accordingly, ALCON requests that the two-year exemption equally apply to the West Virginia regulations.

Moreover, given the significant resource expenditure that will be required for AODC to attempt to comply with the Rule, the minimal environmental gain given the unique design of the AODC facility, and the potential impacts to AODC's quality control process, ALCON believes the EtO NESHAP Rule should be rescinded as applied to the AODC facility. ALCON also welcomes any future opportunity to provide EPA with the technical information it requires to promulgate a revised EtO NESHAP Rule that will not negatively impact critical medical devices manufactured and sterilized at the ALCON AODC facility.

Thank you for your consideration.

Sincerely,

CONTAINS CONFIDENTIAL COMMERCIAL INFORMATION – EXEMPT FROM DISCLOSURE UNDER THE FREEDOM OF INFORMATION ACT

Re: Presidential Exemption Request: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24090 (Apr. 5, 2024), for B. Braun US. Device Manufacturing LLC's Allentown Facility

To Whom it May Concern:

B. Braun US Device Manufacturing LLC[1] ("BB Device" or the "Company") requests a Clean Air Act Section 112 Presidential Exemption. BB Device respectfully requests President Trump exercise his authority under section 112(i)(4) of the Clean Air Act ("CAA") to grant BB Device a two-year exemption to comply with the requirements of the EPA's final rule "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review"[2] (hereafter the "2024 Rule"). BB Device requests a two-year exemption from all compliance deadlines for the 2024 Rule including: (i) all standards and requirements related to CAA Section 112(f); and (ii) all standards and requirements related to CAA Section 112(d). BB Device requests this exemption for its medical device manufacturing facility located at 901 Marcon Blvd., Allentown PA 18109 (the "Allentown Manufacturing Facility").

BB Device takes its commitments to the environment seriously and has invested significant time, energy, and resources to timely comply with the 2024 Rule. BB Device has made significant progress towards that goal. However, the lack of availability of

[1] Prior to May 1, 2024, the Allentown Manufacturing Facility was owned and operated by B. Braun Medical, Inc. Due to corporate restructuring, as of May 1, 2024, the Allentown Manufacturing Facility is owned and operated by B. Braun US Device Manufacturing LLC.
[2] 89 Fed. Reg. 24090 (Apr. 5, 2024).

proven technology needed to comply with the current version of the 2024 Rule, related national security issues as a result of the impact on supply of sterilized medical products, and the EPA's recent decision to reconsider the 2024 Rule "in its entirety", make a two-year compliance exemption necessary and appropriate.

I. The Current 2024 Rule Requires Technology in Limited Supply or Unavailable

The 2024 Rule's current standards present significant challenges regarding available technology. BB Device, and its predecessor B. Braun Medical Inc., have spent decades investing in ethylene oxide abatement equipment for the Allentown Manufacturing Facility that meets or exceeds EPA standards. Consistent with our history of regulatory compliance and safety, BB Device worked hard and invested significant resources to put itself in a position to comply with many of the technology requirements set forth in the 2024 Rule. Recently, between 2020-2022, BB Device invested millions in new abatement and monitoring equipment. Even with all of BB Device's preparations, there are real issues with the availability of certain technologies.

Practically, even if the necessary technologies exist, they are in limited supply. The 2024 Rule sets new destruction removal efficiency standards ("DRE") for many aspects of the sterilization process, and the Rule changes how DREs are calculated—requiring sterilizers to achieve these DREs on a thirty-day rolling average. If the technology does exist to comply with these requirements, it is scarce, and requires facility redesigns, equipment customization, installation, testing, and validation. Considering the number of sterilization facilities across the country that will need the same upgrades, many will not be able to meet the current deadlines.

There are also questions about whether any currently available technology can achieve the DRE requirements in the 2024 Rule. By way of example, in 2020, BB Device installed a customized EtO abatement system that controls its sterilization chamber vents and has a proven stack test DRE of more than 99.9%. Although BB Device believes the system may be able to achieve the 99.99% DRE standard under the 2024 Rule through innovations and adjustments, that has not been proven. Achieving the 2024 Rule's required DRE over a 30-day average raises concerns and questions for all of its sterilization vents.

If the necessary technology to bring sterilizers in compliance with the 2024 Rule is unavailable, there are no proven alternative sterilization methods to sterilize all medical devices. The FDA[3] acknowledged: "[f]or many medical devices, sterilization

[3] FDA, *Sterilization for Medical Devices* available at https://www.fda.gov/medical-devices/general-hospital-devices-and-supplies/sterilization-medical-devices#:~:text=Medical%20devices%20are%20sterilized%20in,acid%2C%20and%20nitrogen%20dioxide) (last updated: November 26, 2024); *see also* EPA, *Additional Questions About Ethylene Oxide*, available at https://www.epa.gov/hazardous-air-pollutants-ethylene-

with ethylene oxide may be the only method that effectively sterilizes and does not damage the device during the sterilization process." Even if an alternative sterilization method is identified, it will take years to test, install, and scale that process. Ex. 4 CBI

Ex. 4 CBI

II. Without an Exemption, Sterilizers May be Forced to Shut Down, Which Would Eliminate Necessary Medical Devices From the Market and Threaten National Security

Any facility that cannot comply with the 2024 Rule's deadlines would need to shut down its sterilization operations, which would place national security at risk because it would reduce the number of life-saving medical devices available in the US Market.

BB Device manufactures crucial life-saving devices at the Allentown Manufacturing Facility for patients throughout the country. As just one example, BB Device is a U.S. Market leader in regional anesthesia.[4] If the Allentown Manufacturing Facility was no longer able to sterilize its epidural kits, it would create a severe nationwide shortage. Medical supply shortages can be sudden and unexpected, such as when Hurricane Helene damaged a manufacturing facility in the fall of 2024, which led to nationwide shortages for intravenous products.[5] Shortages place the public at risk and add an additional layer of uncertainty to healthcare. Ex. 4 CBI

Ex. 4 CBI

oxide/additional-questions-about-ethylene-oxide-eto#:~:text=As%20of%20now%2C%20EtO%20is,to%20patients%2C%20especially%20during%20surgery (last updated January 14, 2025).

[5] FDA, *Hurricane Helene: Baxter's Manufacturing Recovery in North Carolina*, available at https://www.fda.gov/drugs/updates-2024-hurricane-season/hurricane-helene-baxters-manufacturing-recovery-north-carolina (last updated March 18, 2025).

CONTAINS CONFIDENTIAL COMMERCIAL INFORMATION

If the Allentown Manufacturing Facility could not sterilize and ship its products, other manufacturers do not have the capacity to make up the shortfall and would need to decrease the manufacture of other products made in the ordinary course of business. Further, BB Device would not be able to simply move all of its products to contract sterilization overnight. Contract sterilizers do not have unlimited capacity, and if multiple manufacturers have their sterilization operations shut down because of the 2024 Rule, it would compound those capacity constraints.

III. EPA's Reconsideration of the 2024 Rule

The EPA announced its intent to reconsider the 2024 Rule "in its entirety", and stated that "some or all" provisions of the Rule may be revised. On March 25, 2025, the EPA filed a brief with the Court of Appeals for the District of Columbia, in which the EPA told the Court that "EPA has decided to reconsider the 2024 Rule ***in its entirety***."[6] The EPA explained that it "anticipates its reconsideration of the Rule will involve further rulemaking that could revise or rescind ***some or all of the portions of the Rule***."[7]. In support of its position, the EPA included as an exhibit a March 21, 2025, letter from Abigale Tardif, Principal Deputy Assistant Administrator of the Office of Air and Radiation that stated the EPA was reconsidering the 2024 Rule[8], including its authority and decision to undertake a second residual risk review and the resulting risk standards. The EPA's stated goal is to complete its reconsideration by March 2026.[9]

With the entire 2024 Rule under reconsideration, it is possible the EPA will "revise or rescind" some or "all" aspects of the 2024 Rule. Under those circumstances a two-year compliance exemption is both appropriate and necessary. Until the reconsideration process is complete it will be impossible for any sterilizer to ensure its operations comply with any changes or revisions that may be made to the Rule.

Request for Presidential Exemption:

National Emissions Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review (89 FR 24090; April 5, 2024) (Sterilizer Rule): DeRoyal Industries, Inc., 1135 and 1211 Highway 33 South (Two Facilities), New Tazewell, TN 37825

About DeRoyal Industries, Inc.: DeRoyal is a global medical device manufacturer headquartered in Powell, Tennessee, with over 50 years of experience serving the healthcare industry. The company offers a vast portfolio of products across several distinct markets, including surgical and safety devices, orthopedic bracing and supports, custom procedure trays, wound care products, and inventory management technologies. As one of the most vertically integrated companies in medical device manufacturing, DeRoyal has sterilized products for itself and others over the last 40 years.

Emissions standards or limitations subject to the request:

National Emissions Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review (89 FR 24090; April 5, 2024) (Sterilizer Rule)

Facility(ies) and/or affected source(s):

- 1135 Highway 33 South, New Tazewell, TN 37825
- 1211 Highway 33 South, New Tazewell, TN 37825

Length of compliance period being requested:

2 years

Why the technology to implement the standard is not available:

The U.S. Environmental Protection Agency ("EPA") published final amendments to its Sterilizer Rule in March 2024. The Sterilizer Rule sets forth extensive requirements for commercial sterilizers to reduce air emissions of ethylene oxide ("EtO"), install systems for continuous monitoring of air emissions, and report monitoring data to the agency.

The Sterilizer Rule includes stricter emissions control standards for chamber sterilization vents and aeration room vents and new standards for previously unregulated emissions sources such as chamber exhaust vents and "room air emissions," also known as fugitive emissions. The strictness of the rule's emissions control standards varies based on the volume of EtO used by a facility. For large volume sterilizers, the emissions control standards changed significantly:

- Sterilization chamber vent: continuously reduce EtO emissions by 99.99% *(previously 99% except during startup, shut down and malfunction)*
- Aeration room vent: continuously reduce EtO emissions by 99.9% *(previously 99% except during startup, shut down and malfunction)*
- Chamber exhaust vent: continuously reduce EtO emissions by 99.9% *(previously unregulated)*
- Room air emissions (Group 1 and Group 2 emissions): contain all room air emissions within a permanent total enclosure (per EPA Method 204) and continuously reduce EtO emissions by 98% *(previously unregulated)*

Notably, several rule changes were made to emissions standards with the publication of the final Sterilizer Rule that were not provided in the proposed rule for public comment.[1] An important example is the change from 99.94 percent emission reduction for sterilization chamber vents for ETO use of at least 40 tpy to 99.99 percent emission reduction. It remains unclear at this time that the technology available for purchase meets the stringent requirements of the final rule regarding emission limitations. There is significant concern that the available emission control equipment will consistently achieve 99.99% destruction removal efficiency. However, it is certain that these unannounced changes made at the finish line in the rule-making process moved the target that commercial sterilizers were pushing towards in their compliance plans.

The Sterilizer Rule also makes clear that emissions standards apply during startup, shutdown, and malfunction. This is a new requirement. The particular lack of exemption for a malfunction is extremely onerous. Indeed, other NESHAPs have implemented less stringent alternative emission limits or work practice standards during startup, shutdown and malfunction periods of operation. Malfunctions are neither predictable nor routine. Due to the nature of sterilization operations and various stages of sterilization cycles, commercial sterilizers must be able to address malfunctions that could result in a potential risk to the employees and/or facility without the risk of automatically being in noncompliance.

EPA's determination of 10 ppb as the lowest level at which current technology can measure EtO is based on the potential make-up of emissions streams and the "belief" that this is the lowest level that can be demonstrated and replicated across a wide range of emission profiles.[2] Emission profiles are dependent upon inlet and outlet concentrations making it difficult to establish a 99.99% destruction removal efficiency, especially at lower concentrations. It is still undetermined whether current technologies can reliably provide continuous emissions monitoring at these varying concentrations. Without technologies with efficacy to continuously measure the emissions standards to that level for all emissions profiles, compliance cannot be demonstrated with the emission limits set forth in the Sterilizer Rule. While the EPA has stated that it expects "EtO CEMS manufacturers, measurement companies, and laboratories will continue to improve EtO detection levels,"[3] it is unknown

[1] Sterilizer Rule, 89 FR 24123, April 5, 2024.
[2] *Id.*
[3] Sterilizer Rule, 89 FR 24108, April 5, 2024.

how long it may take EtO CEMS manufacturers, measurement companies, and laboratories to make and validate improvements. However, the industry is certain that more time is needed.

Ex. 4 CBI

DeRoyal appreciates that EPA changed the 18-month compliance period to 2 years in recognition of supply chain issues related to technology needs. Ex. 4 CBI

Ex. 4 CBI

Finally, it is this company's belief that all commercial sterilizers have undergone some element of redesign. This redesign (and any new design) has prolonged the supply chain backlog considering that there is one experienced engineering firm and one vendor for necessary control equipment.

Why an extension is in the national security interests of the United States:

Ethylene oxide sterilization is a method of sterilization that manufacturers widely use to keep medical devices safe. For many medical devices, sterilization with ethylene oxide is the only method that effectively sterilizes and does not damage the device during the sterilization process. Medical devices made from certain polymers (plastic or resin), metals, or glass, or that have multiple layers of packaging or hard-to-reach places are likely sterilized with ethylene oxide. Literature shows that about fifty percent of all sterile medical devices in the U.S. are sterilized with ethylene oxide.[4]

[4] U.S. Food and Drug Administration, https://www.fda.gov/medical-devices/general-hospital-devices-and-supplies/sterilization-medical-devices#FC, accessed March 27, 2025.

According to the U.S. Cybersecurity & Infrastructure Security Agency ("CISA"), a program under the U.S. Department of Homeland Security, the national security of healthcare and public health serves to protect all critical infrastructure sectors of the U.S. economy from hazards such as terrorism, infectious disease outbreak and national disasters by providing continuity of operations and service delivery.[5] In other words, the healthcare and public health sector's ability to manage risk and respond to emergencies safely and effectively (whether at a national or everyday American level) is paramount to the security and well-being of this country.

As an illustration of the importance of sterilization to healthcare, the types of devices that are sterilized with ethylene oxide range from devices used in general health care practices (for example, wound dressings) to more specialized devices used to treat specific areas of the body (for example, stents) to personal protective equipment necessary for infection control (for example, surgical gloves and gowns). Without resilient supply of these types of sterile devices, safe and effective healthcare cannot be provided.

Turning to the Sterilizer Rule, EPA's last-minute rule changes to and short implementation of its Sterilizer Rule, combined with the technology concerns outlined above, places America's security and well-being in jeopardy by challenging the resiliency of the healthcare supply chain. As a result, commercial sterilizers, their equipment manufacturers and environmental engineers require more time to determine a path to compliance.

As discussed above, several rule changes were made to emission standards with the publication of the final rule that were not provided in the proposed rule for public comment. These changes made at the finish line in the rule-making process moved the target that commercial sterilizers were pushing towards in their compliance plans.

After moving compliance targets, and being well-informed during the comment period of the supply-chain concerns for engineering services and technology,[6] EPA issued a compliance period of only 2-years from publication of the final rule.

In addition, smaller commercial sterilizers are electing to close due to the requirements of the final rule. Further, any company that is unable to meet the compliance deadline will not be able to supply sterile medical devices from that date forward. Thus, when either of these situations occur, the capacity of commercial sterilization services in the U.S. is limited. This company is not aware of any additional sterilization capacity available to address these situations within the U.S. at this time. **If sterilization capacity is not available in the U.S., it will be unavoidable to obtain foreign-based services to maintain continuity of healthcare operations and services.**

[5] U.S. Cybersecurity & Infrastructure Security Agency, https://www.cisa.gov/topics/critical-infrastructure-security-and-resilience/critical-infrastructure-sectors/healthcare-and-public-health-sector, accessed March 27, 2025.

[6] Environmental Protection Agency, Summary of Public Comments and Response for Risk and Technology Review for Ethylene Oxide Commercial Sterilization Facilities, pp.334-359, February 2024.

Finally, the provision of additional time ties directly to national security concerns within the country's critical infrastructure related to healthcare safety and the availability of domestic manufacturing and processing of critical medical supplies.

In closing:

To make the emission standard changes as late as the publication of the final rule and to maintain a short compliance period has been detrimental to many commercial sterilizers. [redacted]

Respectfully Submitted,

Brian C. DeBusk
CEO & President
DeRoyal Industries, Inc.

From: DConnor@Sterilization-Services.com
To: AirAction
Subject: Presidential Exemption: Sterilizer Rule (89 FR 24090): Sterilization Services of Georgia, Inc.
Date: Monday, March 31, 2025 3:57:40 PM
Attachments: image001.png
EOSA Letter re NESHAP - 2025-03-17.pdf

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

I write on behalf of Sterilization Services of Georgia, Inc. to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

Sterilization Services of Georgia, Inc. requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);

- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. Sterilization Services of Georgia, Inc. appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

David Connor, General Manager

Subject: Presidential Exemption: Sterilizer Rule (89 FR 24090): Sterilization Services of Virginia, Inc.
Date: Monday, March 31, 2025 3:57:46 PM
Attachments: image002.png
EOSA Letter re NESHAP - 2025-03-17.pdf

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

I write on behalf of Sterilization Services of Virginia, Inc. to request that the President issue a two-year exemption pursuant to his authority under CAA Section 112(i)(4) for all emission standards and associated requirements set or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

Sterilization Services of Virginia, Inc. requests that the President issue a two-year exemption as quickly as possible, but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);

- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained further in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained further in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. Sterilization Services of Virginia, Inc. appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as possible.

EPA Releases Proposal for Commercial Sterilizers to Safeguard the Supply of Life-Saving Medical Tools

March 13, 2026

Contact Information

EPA Press Office (press@epa.gov)

WASHINGTON — U.S. Environmental Protection Agency (EPA) proposed amendments to the Biden-era 2024 National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities to ensure consistency with the law and gold standard science. EtO is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters—medical equipment that newborns, the elderly, and Americans undergoing surgery rely on daily to survive. EPA is concerned that the current Biden-era EtO emission standards actively threaten facilities' ability to sterilize equipment and jeopardize one of America's only options for a secure domestic supply chain of essential medical equipment. EPA is committed to a rulemaking process that follows the law, ensures that regulation will not put countless lives at risk, and advances the agency's core mission of protecting human health and the environment, including minimizing Americans' unnecessary exposure to EtO.

> *"This proposed rule shows EPA's strong commitment to protecting people's health while maintaining a stable domestic medical supply chain," **said EPA Administrator Lee Zeldin**. "The Trump EPA is committed to ensuring life-saving medical devices*

remain available for the critical care of America's children, elderly, and all patients without unnecessary exposure to communities."

Congress deliberately designed CAA section 112 with detailed implementation timelines and requirements for residual risk reviews of Maximum Achievable Control Technology (MACT) standards in NESHAP rules. In 2024, however, the Biden-Harris EPA took the unprecedented step of conducting a second, "discretionary" residual risk review despite already completing the residual risk review required by law within eight years of promulgating the NESHAP. This second risk review, done in apparent contravention of the best reading of the statute using an almost decade old risk-based value for EtO, led to the 2024 EtO Commercial Sterilizer Final Rule (2024 NESHAP). During and following the promulgation of the Biden-Harris Administration's 2024 NESHAP, the medical community, industry stakeholders and other federal agencies, including the U.S. Food and Drug Administration, raised serious concerns. These concerns included the feasibility of complying with the more stringent EtO emission standards and the significant impacts the requirements would have on maintaining a strong domestic supply chain for sterilized medical equipment essential to saving American lives. Commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S. every year—or 20 billion medical devices—with no viable alternative on the market.

As a result of the 2024 NESHAP, the Biden-Harris Administration was forced in January 2025 to establish a Presidential exemption process from the administration's own rule due to facilities' inability to meet required standards before compliance deadlines, and the grave risk that the closures of these facilities posed to American lives. In response to legal, scientific and policy concerns, including the critical medical supply chain issue the U.S. faced due to the 2024 NESHAP rule, the Trump EPA issued a press release on March 12, 2025, announcing its reconsideration of the 2024 NESHAP, and on March 21, 2025, formally granted voluntary reconsideration.

With this rule, EPA is proposing that section 112(f)(2) of the CAA prevents EPA from conducting more than the one risk review EPA completed in 2006. Therefore, the second risk review the Biden EPA conducted in 2024 violated the CAA and should never been completed. In line with congressional intent, EPA is proposing to remove the risk-based CAA section 112(f)(2) standards which justified the 2024 NESHAP. EPA is also proposing to change other requirements that were promulgated from the standards, including the requirement to use continuous emission monitoring systems, technology review standards for new aeration room vents (ARV), and requirements for permanent total enclosure. If finalized as proposed, the Trump EPA's rule would give facilities the choice between installing a new monitoring system or making adjustments to the 2024 EtO standards for technology review standards for new ARV where EtO is greater than ten tons per year. These changes better reflect the complexity of facilities and give them the flexibility to work to use safe and effective equipment to sterilize medical tools and devices without compromising clean air for all Americans. EPA is proposing to keep the 2024 NESHAP standards consistent with the CAA and that result in facilities installing attainable emission controls consistent with the latest required technology review. The Trump EPA is committed to following the law exactly as it is written, while also ensuring standards effectively protect human health and the environment.

Since 2016, new information, including new epidemiological studies, advancements in statistical methods related to dose-response modeling have continued to emerge. It is known that EtO is produced within the body via normal processes and additionally from tobacco smoke or other combustion processes. As part of this rulemaking, EPA is seeking comment on new information related to these sources of EtO exposure. EPA anticipates this information would be useful for updating the agency's understanding of EtO exposure and toxicity and determining whether the 2016 EtO IRIS value remains suitable for estimating risk to inform regulatory decision-making, including the proposed amendments

announced today. The agency will also consider comments regarding the Texas Commission of Environmental Quality's 2020 finalized alternative assessment of EtO's toxicity and potential to cause cancer or other alternative values not yet considered by the agency.

EPA estimates that this proposed action would save approximately $630 million in costs over 20 years, or about $43 million annually, not including the immeasurable value of the countless lives that would be saved from lethal or significantly debilitating infections that would result without properly sterilized medical equipment.

EPA will accept public comments on this proposal for 45 days after it is published in the *Federal Register*. EPA will hold a virtual public hearing for this proposed action 15 days after publication in the *Federal Register*.

For more information about this rulemaking and further details about the public hearing, please visit here.

Background

EtO is a colorless gas that is critical to the medical device supply chain. The EtO Commercial Sterilization NESHAP regulates EtO emitted from commercial sterilization facilities. Commercial sterilization covers the sterilizer process that uses EtO to sterilize or fumigate materials such as medical equipment and supplies, spices, and other miscellaneous products and items. This process is designed to eliminate microorganisms including bacteria, viruses, fungi, and protists from products to ensure they are safe for human use and consumption.

EtO sterilization plays a key role in the medical device supply chain, sterilizing a variety of devices ranging from general health care items, such as wound dressings, to specialized devices, such as stents. For many heat- and moisture-sensitive products, EtO sterilization is the only method that effectively sterilizes a product without damaging it.

Today, there are about 90 commercial sterilization facilities owned and operated by approximately 50 companies. EPA issued the original NESHAP under section 112(d) of the CAA in 1994, establishing emission limits for sterilization chamber vents, ARVs, and catalytic oxidizer vents (CEVs). In 2001, EPA revised the NESHAP to remove requirements for CEVs due to equipment failure. In 2006, EPA finalized a residual risk and technology review under CAA sections 112(f)(2) and (d)(6) with no further changes. On April 5, 2024, EPA finalized amendments to the EtO Sterilizers NESHAP based on the results of a residual risk and technology review outside the scope of CAA statutory authority.

COMMISSION ON SECURITY AND COOPERATION IN EUROPE (U.S. HELSINKI COMMISSION)

March 31, 2025

The Honorable Lee Zeldin
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Ave NW
Washington, DC 20460

Dear Administrator Zeldin,

I am writing to request a comprehensive list of companies that have a headquarters or facility within Tennessee's Ninth Congressional District that have requested a Presidential Exemption under the Clean Air Act, as outlined by the EPA on March 24, 2025.

Several communities in Memphis, and especially in Southwest Memphis, have long endured the cumulative effects of industrial pollution, resulting in higher rates of respiratory illness, cancer and other chronic health conditions. The potential for companies operating in these areas to obtain exemptions from critical environmental safeguards under the Clean Air Act would further exacerbate these public health disparities and increase the risk of long-term environmental harm.

In addition to the names of any companies that operate within Tennessee Ninth Congressional District that requested this exemption, please also include the details of their exemption request, including any emissions standards or limitations subject to the request, facility(ies) and/or affected sources, the length of compliance period being requested, any explanation why the technology to implement the standard is not available, and any explanation why an extension is in the national security interests of the United States. Please also include which of these companies, if any, expressed an intention to submit proprietary information.

I would also like to know how your agency plans to announce which companies are granted a presidential exemption and which applied but were denied. I expect all of this information to be made easily available to the public, as the Trump Administration repeatedly states that it is the "most transparent administration in history."

Given the existing concerns and the pressing need for stronger protections, I believe it is imperative for the community to understand which companies may be seeking to circumvent current regulations.

I appreciate your attention to this urgent request and look forward to receiving the information about requests to be exempted from the Clean Air Act by the close of this business week.

As always, I remain,

Most sincerely,

Steve Cohen
Member of Congress

EPA Releases Proposal for Commercial Sterilizers to Safeguard the Supply of Life-Saving Medical Tools

March 13, 2026

Contact Information

EPA Press Office (press@epa.gov)

WASHINGTON — U.S. Environmental Protection Agency (EPA) proposed amendments to the Biden-era 2024 National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities to ensure consistency with the law and gold standard science. EtO is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters—medical equipment that newborns, the elderly, and Americans undergoing surgery rely on daily to survive. EPA is concerned that the current Biden-era EtO emission standards actively threaten facilities' ability to sterilize equipment and jeopardize one of America's only options for a secure domestic supply chain of essential medical equipment. EPA is committed to a rulemaking process that follows the law, ensures that regulation will not put countless lives at risk, and advances the agency's core mission of protecting human health and the environment, including minimizing Americans' unnecessary exposure to EtO.

> *"This proposed rule shows EPA's strong commitment to protecting people's health while maintaining a stable domestic medical supply chain,"* ***said EPA Administrator Lee Zeldin****. "The Trump EPA is committed to ensuring life-saving medical devices*

remain available for the critical care of America's children, elderly, and all patients without unnecessary exposure to communities."

Congress deliberately designed CAA section 112 with detailed implementation timelines and requirements for residual risk reviews of Maximum Achievable Control Technology (MACT) standards in NESHAP rules. In 2024, however, the Biden-Harris EPA took the unprecedented step of conducting a second, "discretionary" residual risk review despite already completing the residual risk review required by law within eight years of promulgating the NESHAP. This second risk review, done in apparent contravention of the best reading of the statute using an almost decade old risk-based value for EtO, led to the 2024 EtO Commercial Sterilizer Final Rule (2024 NESHAP). During and following the promulgation of the Biden-Harris Administration's 2024 NESHAP, the medical community, industry stakeholders and other federal agencies, including the U.S. Food and Drug Administration, raised serious concerns. These concerns included the feasibility of complying with the more stringent EtO emission standards and the significant impacts the requirements would have on maintaining a strong domestic supply chain for sterilized medical equipment essential to saving American lives. Commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S. every year—or 20 billion medical devices—with no viable alternative on the market.

As a result of the 2024 NESHAP, the Biden-Harris Administration was forced in January 2025 to establish a Presidential exemption process from the administration's own rule due to facilities' inability to meet required standards before compliance deadlines, and the grave risk that the closures of these facilities posed to American lives. In response to legal, scientific and policy concerns, including the critical medical supply chain issue the U.S. faced due to the 2024 NESHAP rule, the Trump EPA issued a press release on March 12, 2025, announcing its reconsideration of the 2024 NESHAP, and on March 21, 2025, formally granted voluntary reconsideration.

With this rule, EPA is proposing that section 112(f)(2) of the CAA prevents EPA from conducting more than the one risk review EPA completed in 2006. Therefore, the second risk review the Biden EPA conducted in 2024 violated the CAA and should never been completed. In line with congressional intent, EPA is proposing to remove the risk-based CAA section 112(f)(2) standards which justified the 2024 NESHAP. EPA is also proposing to change other requirements that were promulgated from the standards, including the requirement to use continuous emission monitoring systems, technology review standards for new aeration room vents (ARV), and requirements for permanent total enclosure. If finalized as proposed, the Trump EPA's rule would give facilities the choice between installing a new monitoring system or making adjustments to the 2024 EtO standards for technology review standards for new ARV where EtO is greater than ten tons per year. These changes better reflect the complexity of facilities and give them the flexibility to work to use safe and effective equipment to sterilize medical tools and devices without compromising clean air for all Americans. EPA is proposing to keep the 2024 NESHAP standards consistent with the CAA and that result in facilities installing attainable emission controls consistent with the latest required technology review. The Trump EPA is committed to following the law exactly as it is written, while also ensuring standards effectively protect human health and the environment.

Since 2016, new information, including new epidemiological studies, advancements in statistical methods related to dose-response modeling have continued to emerge. It is known that EtO is produced within the body via normal processes and additionally from tobacco smoke or other combustion processes. As part of this rulemaking, EPA is seeking comment on new information related to these sources of EtO exposure. EPA anticipates this information would be useful for updating the agency's understanding of EtO exposure and toxicity and determining whether the 2016 EtO IRIS value remains suitable for estimating risk to inform regulatory decision-making, including the proposed amendments

announced today. The agency will also consider comments regarding the Texas Commission of Environmental Quality's 2020 finalized alternative assessment of EtO's toxicity and potential to cause cancer or other alternative values not yet considered by the agency.

EPA estimates that this proposed action would save approximately $630 million in costs over 20 years, or about $43 million annually, not including the immeasurable value of the countless lives that would be saved from lethal or significantly debilitating infections that would result without properly sterilized medical equipment.

EPA will accept public comments on this proposal for 45 days after it is published in the *Federal Register*. EPA will hold a virtual public hearing for this proposed action 15 days after publication in the *Federal Register*.

Re: *Powering the Great American Comeback Fact Sheet, Request for two-year compliance exemption pursuant to Clean Air Act Section 112(i)(4) for New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants (NESHAP) for the Synthetic Organic Chemical Manufacturing Industry (SOCMI) and Group I & II Polymers and Resins Industry.*

To Whom It May Concern:

We are writing on behalf of the American Chemistry Council (ACC)[1] and the American Fuel & Petrochemical Manufacturers (AFPM)[2] to request a two-year exemption from the compliance obligations of the New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards (NSPS) for Hazardous Air Pollutants (NESHAP) for the Synthetic Organic Chemical Manufacturing Industry (SOCMI) and Group I & II Polymers and Resins Industry (collectively referred to as the HON Rule) for sources in the categories covered by the rule.[3] Together, ACC and AFPM submit this request on behalf of our member companies that own or operate affected stationary sources and facilities as a supplement to additional materials sent directly from those companies in response to EPA's request for information.

Our members are deeply committed to responsibly operating their manufacturing sites for key stakeholders: the communities in which they operate, and their employees, customers, and shareholders. That responsibility includes working to ensure that the regulation of our industry is based on sound science and that those regulations reflect a reasonable assessment of the risks and benefits involved. Unfortunately, the HON Rule undermines those important objectives and advances improper and significantly costly requirements on an unworkable timeline. As we have

[1] ACC represents the leading companies engaged in the business of chemistry. ACC members apply the science of chemistry to make innovative products and services that make people's lives better, healthier, and safer. ACC is committed to improved environmental, health and safety performance through Responsible Care®, common sense advocacy designed to address major public policy issues, and health and environmental research and product testing.

[2] AFPM is a national trade association representing nearly all U.S. refining and petrochemical capacity, as well as midstream industries. In addition to actively pursuing emissions reductions from their operations, our members are committed to sustainably manufacturing and delivering affordable and reliable fuels powering our transportation needs and chemical building blocks integral to millions of products that make modern life possible.

[3] National Emissions Standards for Hazardous Air Pollutants (NESHAP), Powering the Great American Comeback https://www.epa.gov/system/files/documents/2025-03/neshap_powering-the-great-american-comeback_fact-sheet_2.pdf 89 Fed. Reg. 42932 (May 16, 2024).

previously detailed, the cost for the rule's risk-related requirements alone could exceed $50 billion, significantly more than the $1.8 billion for the full rule that EPA estimated at final publication.[4] We note separately that your Administration has recognized these concerns in granting reconsideration and indicating an intent to review these requirements.

For the reasons highlighted in this letter, we believe it is necessary and appropriate for the President to grant an exemption under Clean Air Act (CAA) Section 112(i)(4) for all affected stationary sources and facilities regulated by the final rule. According to the relevant statutory language, Section 112(i)(4) authorizes the President to

> "exempt any stationary source from compliance with any standard or limitation under this section for a period of not more than 2 years if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so."[5]

We urge the Administration to swiftly consider and issue such an action based on an understanding that:

- "Availability" for the purposes of this section refers not only to the lack of technology capable of achieving compliance with the rule, but also encompasses the practical challenges with the timeframes necessary to plan, procure, and install required technologies -- such activity cannot occur within the current compliance timeframe. "Availability" may also encompass consideration of cost and impact on selection of controls, as high costs may render controls functionally unavailable and unreasonable timelines may force a facility to select suboptimal often more costly control options.

- National security encompasses not only military defense applications and infrastructure, but also economic security, a perspective that has been acknowledged by the President in Executive Orders and key security agencies like the Department of Defense. Indeed, as the White House has stated regarding domestic priorities, "economic security is national security."[6]

As detailed in our comments on the proposed HON Rule, which can be found here, our attached Petition for Reconsideration, and several compliance extension requests submitted by member companies (which we ask be incorporated into the Agency's consideration), facilities are unable to meet the unrealistic compliance deadlines for many of the HON Rule's requirements, including the July 15, 2026 deadline for the rule's risk related requirements.[7] As such, we believe that a two-year Presidential exemption from compliance obligations pursuant to the Clean Air Act (CAA) Section 112(i)(4) is critical to allow EPA and regulated entities sufficient time to and address

[4] Regulatory Impact Analysis for the Final New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry. Docket ID: EPA-HQ-OAR-2022-0730. March 2024.

[6] https://www.whitehouse.gov/presidential-actions/2025/02/america-first-investment-policy/
[7] The HON Rule represents changes to six separate rulemakings that significantly impact several groups of chemical manufacturing entities that may force numerous facilities offline and create potential supply chain disruptions for critical products.

technology availability issues as discussed in this letter and our Petition for Reconsideration.

While EPA requests that "sources" provide recommendations as to why a two-year Presidential exemption is warranted under the Clean Air Act (CAA) Section 112(i)(4), we write as broader associations on behalf of our member companies because the rule's current compliance deadlines are generally unachievable.[8] We believe that information provided in this letter, our previous Petition for Reconsideration on the rulemaking, and several member company requests for extension to the compliance deadlines all provide sufficient information to justify EPA's grant of an exemption under this section on a source category-wide basis. If, however, the President determines that it is necessary to make determinations on a source-by-source basis, he should do so for all affected sources and facilities identified by the Agency, considering both the national security and general feasibility concerns presented in this letter as well as information submitted by member companies.

I. A Presidential Exemption Granting a 2-Year Compliance Extension is Necessary

ACC and AFPM request Presidential exemption(s) for regulated facilities because either there is no existing technology to implement the requirements of the Rule, or technology is not available in time to meet the Rule's compliance deadlines. As previously explained to EPA, for some facilities and requirements this may be a literal lack of availability (no technology may exist that will allow them to meet the standards), while for others a central challenge may be a lack of availability due to the practicalities of designing, procuring, permitting and installing the controls within the deadlines contained in the rule. Absent a Presidential exemption, sources will be required to make irrevocable investment decisions now and into the coming months to minimize the amount of time facilities may need to be taken offline. If implemented as written and in accordance with the current compliance schedule, domestic manufacturing production will be negatively impacted, threatening critical supply chains of chemicals that are vital to our nation's security.

Any new regulatory requirement requires facilities to review the provisions, develop a plan to comply with the new requirements, determine if process changes or additional controls are needed, determine if an air permit application is needed, prepare and submit the permit application, obtain the air permit approval from the agency, engineer and implement any process changes or additional controls, determine if new monitoring equipment is needed to meet new ethylene oxide (EO) control device and pressure relief device (PRD) monitoring requirements, install the new monitoring equipment, revise regulatory compliance plans and procedures, update recordkeeping and reporting procedures, and roll out new requirements to facility staff.

While the above process could represent a time-consuming and extensive commitment under just one rule's requirements, the HON rule is a collection of six distinct regulatory actions rolled into one which adds complexity and time needed to comply with the full range of these requirements. A centerpiece of the HON Rule is to regulate EO emissions SOCMI sources. As detailed in our comments, two years is not enough time to conduct the activities that are required to comply with these new requirements. To navigate this process, companies must complete sampling and analysis on an array of process vents and wastewater streams and review available information for equipment, heat exchange systems, and storage tanks to determine whether sources must comply with certain requirements. Once sources are identified, time is required to review the performance of existing control devices to determine whether existing controls can meet

[8] See EPA's List of Facilities Subject to the HON, Group I and Group II Polymers and Resins NESHAPs, and NSPS subparts VV, VVa, III, NNN, and RRR, March 2023 attached at Appendix _.

the emissions standards. As acknowledged in EPA's impact analyses, facilities will be required to install new closed vent systems, control devices, monitoring equipment, and develop new standard operating procedures, recordkeeping templates, and reporting methodologies. As we outlined in comments and our Petition for Reconsideration, the myriad steps in the compliance process for a facility can take 36 months or more from initial applicability determinations to equipment operation, which presumes no major hurdles or delays associated with procurement or technology availability.

As just one example on this point, one member, Indorama Ventures Oxides, LLC ("Indorama"), began discussions with vendors and consultants on potential control technology in July 2023. At the time of the HON rule's July 2024 publication, Indorama was proceeding with preliminary engineering design and evaluating controls that could meet the Rule's requirements for multiple emission control projects. By the first quarter of 2025, Indorama engaged an engineering firm to begin the next phase of engineering design for the required controls. Despite this early engagement, the company has been informed that controls are unlikely to be installed and operational before *2029* due to permitting and supply chain limitations. In addition to the concerns about the availability of controls related to capital expenditure projects, we also understand that other Rule requirements pose practical or literal availability concerns. As EPA previously heard, some companies are not able to determine if they can install a suite of controls that will allow them to comply with the Rule. In addition to these concerns, the following list highlights some specific requirements that speak to these concerns:

- **Fenceline Monitoring**--As currently written, the HON Rule requires sources to implement fenceline monitoring requirements for six chemicals (benzene, 1,3-butadiene, ethylene dichloride, vinyl chloride, EtO, and chloroprene) by July 15, 2026. As detailed above, the simple process to prepare for compliance and initiate new monitoring programs will take longer than the current time permitted. With a new fenceline monitoring program, facilities must select contractors and laboratories after a competitive bid process and then acquire an adequate supply of canisters, flow controllers, timers, and tubes in time for compliance. In fact, one member was unable to locate a laboratory to perform the Rule's required test method because it will take significant time for laboratories to increase their capacity to meet the fenceline monitoring requirements. Many facilities will also be required to make physical improvements such as roads to make their fencelines readily accessible for sampler placement and retrieval. Most contractors assisting our members with implementing the fenceline monitoring requirements stated that a pilot study is necessary to guide the development of a fenceline monitoring program specific to each facility. This pilot program will take no less than six months to complete. Sources expect they will be required to hire and train additional staff and/or contractors to implement the sampling program and perform the associated data analysis and RCA/CA. It is technically infeasible to implement all steps by the current July 15, 2026 compliance deadline.

- **Pressure Relief Devices (PRDs)**--There are also technical limitations to consider that would prevent the possibility of all PRDs being controlled. Processes are designed with these PRDs to ensure the safety of personnel and equipment, and they will need to be retained. Modifications will occur on existing air oxidation reactors, distillation operations, and reactor processes such that they will be required to comply with the new NSPS subparts. Absent plans to completely rebuild the affected source and associated infrastructure, legacy PRDs will often be retained. If there are safety concerns with routing these to control, it will be impossible for the facility to avoid releases from these PRDs directly to the atmosphere. To the extent a facility is considering trying to control PRDs either through an existing control device or building an entirely new control device, the non-

routine, infrequent, and episodic nature of these PRD releases make it infeasible to install a control system capable of accommodating all the possible release scenarios. Accordingly, for at least some PRDs with atmospheric releases, there may literally be no available technology to prevent potential releases, and thus violations under the rule.

- **Real-time Sampling**--The HON Rule also requires real-time sampling techniques if the root cause of an action level exceedance has not been determined within 30 days of determining the action level has been exceeded.[9] As discussed in our comments, our members use external contracts to employ real-time monitoring and appropriate staff and equipment are not always available within 30 days. Facilities cannot control the availability of outside resources (either contractor staff or equipment). For example, one member has indicated that even with sampling staff on-site daily, if contract laboratories are required for sample analysis, it is likely that it will take longer than 30 days to receive results from the labs due to significant increases in demand for summa canister analysis created by the requirements of this program.

- **Flow Meters**-- Flow meter technology remains a hurdle. Flares are designed to control a range of events with a wide range of materials and volumes. When designing a control system capable of accommodating all the possible flare volume scenarios that could occur, accuracy becomes impractical at low flow events when also accommodating precision at high flow events. It is unclear that an accurate control system can be designed and implemented as required by the rule's final requirements, particularly within the current timeframe.

The serious risks and burdens associated with the rule's requirements are equally pressing for facilities that do not emit EO. For example, one member facility is a major U.S. producer of purified teraphthalic acid (PTA) at an integrated site that also produces para-xylene (PX) as a feedstock to the PTA production units. PTA is a backbone chemistry for supply chains that are essential to the everyday lives American consumers, including plastic bottles, polyester clothing, and films. Although the site does not have emissions of EO, they nonetheless face severe compliance risks and substantial adverse operational impacts associated with compliance with the final HON rule. Specifically, due to the site-specific nature of the process design, any control technology must be a standalone grassroots design tailored to the unique needs of the site, increasing the required time and overall costs of any compliance process. This fact, when combined with the exponential costs associated with compliance,[10] results in a full burden of compliance obligations that will likely result in a shutdown of the site's PTA units and its feedstock PX unit. This shutdown would result in the loss of over 2 billion pounds per year of domestic PTA production loss, negatively impacting the associated supply chains and overall U.S. economic production.

The outgoing Administration's approach in the HON rulemaking jeopardizes the ability of domestic manufacturing facilities to continue to support these critical supply chains (both EO and non-EO related), while the Agency simultaneously ignores the sweeping impacts of these decisions, thus impacting the national security interests of the United States. As discussed in

[9] 40 CFR § 63.184(e)(1)(ii)(B).
[10] For one example, this member site estimates that it will need to invest over $30 million to comply just with EPA's requirement to remove the total resource effectiveness calculation for Group 1 process vents, which will impact at least 11 process vents at the site. These costs come in addition to the significant separate costs associated with developing and implementing a benzene fence line monitoring program, PRD compliance, and additional monitoring required for the PX flare.

Section II, ensuring the continued production of EO is vital to our nation's energy, economic, and food security.

II. Granting a Presidential Exemption Serves the National Security Interests of the United States

ACC, AFPM, and our members previously articulated to EPA and state agencies the risks of taking facilities off-line for extended periods to complete the process and equipment changes required by the Rule's final requirements, which will likely result in billions of pounds of lost EO production. These shutdowns will impact not only EO producers, but several supply chains given EO's varied derivatives and end products using EO-based materials throughout our economy. As just one example, because EO is an essential building block for dozens of products, production losses from the Indorama facilities will have a ripple effect to reduce production of products for the home and personal care, crop protection, energy and resources and coatings and construction markets. At one HON facility, a potential shutdown associated with the HON requirements would result in the loss of domestic production of up to 1,475 billion pounds per year of EO, with billions more lost at other sites. A shutdown would also certainly impact and seriously jeopardize the production of dozens of other products derived from EO manufactured at the site and used in home and personal care, crop protection, energy and resources and coatings and construction markets.

As stated in the President's Executive Order "Unleashing American Energy," domestic energy production is a critical component of U.S. national security as production "will restore American prosperity…[and] will also rebuild our Nation's economic and military security, which will deliver peace through strength." Further, as the Executive Order explains, any regulatory activity that impedes the development of this production "weak[ens] our national security."[11] The SOCMI sources subject to the HON Rule produce ethylene oxide (EO), which is a critical building block chemical used is dozens of domestic manufacturing. The following examples help demonstrate EO's critical role in our nation's supply chains:

- Department of Defense (DoD) Critical Sectors: in a February 2025 briefing, DoD personnel identified several "critical sectors" to national security that depend on key chemicals and their materials to support DoD infrastructure, equipment, and weapons systems.[12] In the briefing, DoD specifically cited both energy storage and batteries and microelectronics (semiconductors) as "essential" to DoD's administration of national security interests. EO manufacturing plays a key role in both sectors as detailed here:
    - For batteries, EO is used to produce ethylene carbonate, which is used in lithium-ion batteries to allow the electricity generated to travel more easily through the battery. DoD's briefing referenced that lithium batteries "are becoming increasingly critical for a wide range of operational capabilities, including unmanned systems, missiles, and munitions, directed energy, silent mobility, and platform electrification. DoD acknowledged that supply chains issues would impact the ability of the military to continue to produce and maintain these essential national security components.

[11] Presidential Executive Order "Unleashing American Energy," January 20, 2025. https://www.whitehouse.gov/presidential-actions/2025/01/unleashing-american-energy/.
[12] "Substances Critical to National Security." Department of Defense Briefing for the Committee on Armed Services of the U.S. House of Representatives. Pursuant to House Report 118-529, accompanying H.R. 8070, National Defense Authorization Act for Fiscal Year 2025. February 2025.

- For semiconductors, microelectronic technology is a central component to defense capabilities. In its briefing, DoD emphasized this notion, stating that microelectronics like semiconductors "are essential for all sectors of industry, including defense."[13] EO plays a major role in the production of a wide variety of solvents, amines, and surfactants that are essential in semiconductor chip manufacturing processes like wafer cutting, chemical mechanical planarization, photoresist, and photoresist residue cleaner. These products support the semiconductor industry's specific needs and are crucial to technologies including aerospace, automotive, cloud computing, medical devices, and telecommunications. Through this production, EO facilities play a direct role in supporting national supply chain security and competitiveness priorities.

- Medical sterilization: EO is used to produce about 20 billion medical devices each year, helping to prevent disease and infection for our nation's citizens. EO is also used in the manufacture of numerous other medical supplies and devices. Medical sterilization is independently threatened by a separate rule promulgated by the outgoing administration relying on the same flawed legal theories and science,[14] and, according to the attached information provided by the Ethylene Oxide Sterilizers Association (EOSA) who raised significant compliance concerns with that separate rulemaking. Sterile medical devices are crucial for maintaining the health and readiness of our citizens and military personnel in deployed areas.

- Energy Production: EO derivates contribute to securing our nation's energy security through applications in the production of natural gas, which was reiterated and reinforced in the current Administration's January 20, 2025 Executive Order "Unleashing American Energy."[15] The derivatives of EO are leveraged in several key contexts, including natural gas purification to reduce corrosion and scale in oil and gas processing, oil well remediation, enhanced oil recovery aids, gas dehydration, and carbon capture in gas processing, among others. The use of EO-based compounds allows for faster drilling and completion of oil and gas wells, which helps to lower the overall cost of petroleum products and reduce the frequency of replacing equipment and pipelines. These uses contribute to the strength of our domestic energy production, boosting both our nation's energy independence and overall security.

- Automotive: EO and its derivatives are also critical for the current automotive industry and are used in applications for automotive seating, hydraulic and brake fluids, anti-icing additives, and antifreeze.

- Food Processing: EO is used to sterilize dried foods, spices, nuts, fruits, vegetables, herbs, and other food products to prevent foodborne illnesses without damaging the spices or food products. It is used to eliminate pathogens like Salmonella and E. coli as

[13] Id.
[14] National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24,090 (April 5, 2024); *see also The Ethylene Oxide Sterilization Association* (EOSA) v. *EPA,* No. 24-1180, Brief of Petitioner EOSA (D.C. Cir.).

well as fungi, yeasts, and spore formers. It is also used as a fumigant to control insects in the storage and transport of grain, seeds, and nuts.

- Agriculture: EO derivatives are used in agricultural products to help protect crops and boost crop production. It is used to produce active ingredients in insecticides, pesticides, and herbicides. It is also used to produce surfactants (wetting agents) and dispersants which reduce the amount of pesticides, insecticides, and herbicides required in agriculture and enhances the effectiveness of the application of those products.

The HON Rule and its technically infeasible requirements will result in facility shutdowns, imperiling jobs, and threatening supply chains for a vital chemical building block critical to our national security. The substantial risk of multiple shutdowns combined across HON facilities could result in a massive strain on domestic supply of chemicals that are critical to national security and central to the U.S.'s strategic position in the global economy in key markets.

Without immediate intervention, such as a Presidential exemption under CAA Section 112(i)(4) to extend the compliance deadline for two years or, in the alternative, a compliance extension under CAA Section 112(i)(3), and an interim final rule rescinding those regulatory requirements not based on the best reading of CAA section 112(f), companies will evaluate whether to shut down units or offshore their operations to prevent the application of an imprudent and unlawful rule.

* * * * * * * * *

ACC and AFPM appreciate this opportunity to request a two-year compliance extension for all sources subject to the HON Rule. If you have questions or need more information, please do not hesitate to contact Leslie Bellas at lbellas@afpm.org or Brendan Mascarenhas at Brendan_Mascarenhas@americanchemistry.com.

EPA Releases Proposal for Commercial Sterilizers to Safeguard the Supply of Life-Saving Medical Tools

March 13, 2026

Contact Information

EPA Press Office (press@epa.gov)

WASHINGTON — U.S. Environmental Protection Agency (EPA) proposed amendments to the Biden-era 2024 National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities to ensure consistency with the law and gold standard science. EtO is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters—medical equipment that newborns, the elderly, and Americans undergoing surgery rely on daily to survive. EPA is concerned that the current Biden-era EtO emission standards actively threaten facilities' ability to sterilize equipment and jeopardize one of America's only options for a secure domestic supply chain of essential medical equipment. EPA is committed to a rulemaking process that follows the law, ensures that regulation will not put countless lives at risk, and advances the agency's core mission of protecting human health and the environment, including minimizing Americans' unnecessary exposure to EtO.

> *"This proposed rule shows EPA's strong commitment to protecting people's health while maintaining a stable domestic medical supply chain,"* ***said EPA Administrator Lee Zeldin****. "The Trump EPA is committed to ensuring life-saving medical devices*

remain available for the critical care of America's children, elderly, and all patients without unnecessary exposure to communities."

Congress deliberately designed CAA section 112 with detailed implementation timelines and requirements for residual risk reviews of Maximum Achievable Control Technology (MACT) standards in NESHAP rules. In 2024, however, the Biden-Harris EPA took the unprecedented step of conducting a second, "discretionary" residual risk review despite already completing the residual risk review required by law within eight years of promulgating the NESHAP. This second risk review, done in apparent contravention of the best reading of the statute using an almost decade old risk-based value for EtO, led to the 2024 EtO Commercial Sterilizer Final Rule (2024 NESHAP). During and following the promulgation of the Biden-Harris Administration's 2024 NESHAP, the medical community, industry stakeholders and other federal agencies, including the U.S. Food and Drug Administration, raised serious concerns. These concerns included the feasibility of complying with the more stringent EtO emission standards and the significant impacts the requirements would have on maintaining a strong domestic supply chain for sterilized medical equipment essential to saving American lives. Commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S. every year—or 20 billion medical devices—with no viable alternative on the market.

As a result of the 2024 NESHAP, the Biden-Harris Administration was forced in January 2025 to establish a Presidential exemption process from the administration's own rule due to facilities' inability to meet required standards before compliance deadlines, and the grave risk that the closures of these facilities posed to American lives. In response to legal, scientific and policy concerns, including the critical medical supply chain issue the U.S. faced due to the 2024 NESHAP rule, the Trump EPA issued a press release on March 12, 2025, announcing its reconsideration of the 2024 NESHAP, and on March 21, 2025, formally granted voluntary reconsideration.

With this rule, EPA is proposing that section 112(f)(2) of the CAA prevents EPA from conducting more than the one risk review EPA completed in 2006. Therefore, the second risk review the Biden EPA conducted in 2024 violated the CAA and should never been completed. In line with congressional intent, EPA is proposing to remove the risk-based CAA section 112(f)(2) standards which justified the 2024 NESHAP. EPA is also proposing to change other requirements that were promulgated from the standards, including the requirement to use continuous emission monitoring systems, technology review standards for new aeration room vents (ARV), and requirements for permanent total enclosure. If finalized as proposed, the Trump EPA's rule would give facilities the choice between installing a new monitoring system or making adjustments to the 2024 EtO standards for technology review standards for new ARV where EtO is greater than ten tons per year. These changes better reflect the complexity of facilities and give them the flexibility to work to use safe and effective equipment to sterilize medical tools and devices without compromising clean air for all Americans. EPA is proposing to keep the 2024 NESHAP standards consistent with the CAA and that result in facilities installing attainable emission controls consistent with the latest required technology review. The Trump EPA is committed to following the law exactly as it is written, while also ensuring standards effectively protect human health and the environment.

Since 2016, new information, including new epidemiological studies, advancements in statistical methods related to dose-response modeling have continued to emerge. It is known that EtO is produced within the body via normal processes and additionally from tobacco smoke or other combustion processes. As part of this rulemaking, EPA is seeking comment on new information related to these sources of EtO exposure. EPA anticipates this information would be useful for updating the agency's understanding of EtO exposure and toxicity and determining whether the 2016 EtO IRIS value remains suitable for estimating risk to inform regulatory decision-making, including the proposed amendments

announced today. The agency will also consider comments regarding the Texas Commission of Environmental Quality's 2020 finalized alternative assessment of EtO's toxicity and potential to cause cancer or other alternative values not yet considered by the agency.

EPA estimates that this proposed action would save approximately $630 million in costs over 20 years, or about $43 million annually, not including the immeasurable value of the countless lives that would be saved from lethal or significantly debilitating infections that would result without properly sterilized medical equipment.

EPA will accept public comments on this proposal for 45 days after it is published in the *Federal Register*. EPA will hold a virtual public hearing for this proposed action 15 days after publication in the *Federal Register*.

For more information about this rulemaking and further details about the public hearing, please visit here.

Background

EtO is a colorless gas that is critical to the medical device supply chain. The EtO Commercial Sterilization NESHAP regulates EtO emitted from commercial sterilization facilities. Commercial sterilization covers the sterilizer process that uses EtO to sterilize or fumigate materials such as medical equipment and supplies, spices, and other miscellaneous products and items. This process is designed to eliminate microorganisms including bacteria, viruses, fungi, and protists from products to ensure they are safe for human use and consumption.

EtO sterilization plays a key role in the medical device supply chain, sterilizing a variety of devices ranging from general health care items, such as wound dressings, to specialized devices, such as stents. For many heat- and moisture-sensitive products, EtO sterilization is the only method that effectively sterilizes a product without damaging it.

Today, there are about 90 commercial sterilization facilities owned and operated by approximately 50 companies. EPA issued the original NESHAP under section 112(d) of the CAA in 1994, establishing emission limits for sterilization chamber vents, ARVs, and catalytic oxidizer vents (CEVs). In 2001, EPA revised the NESHAP to remove requirements for CEVs due to equipment failure. In 2006, EPA finalized a residual risk and technology review under CAA sections 112(f)(2) and (d)(6) with no further changes. On April 5, 2024, EPA finalized amendments to the EtO Sterilizers NESHAP based on the results of a residual risk and technology review outside the scope of CAA statutory authority.

EPA Releases Proposal for Commercial Sterilizers to Safeguard the Supply of Life-Saving Medical Tools

March 13, 2026

Contact Information

EPA Press Office (press@epa.gov)

WASHINGTON — U.S. Environmental Protection Agency (EPA) proposed amendments to the Biden-era 2024 National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities to ensure consistency with the law and gold standard science. EtO is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters—medical equipment that newborns, the elderly, and Americans undergoing surgery rely on daily to survive. EPA is concerned that the current Biden-era EtO emission standards actively threaten facilities' ability to sterilize equipment and jeopardize one of America's only options for a secure domestic supply chain of essential medical equipment. EPA is committed to a rulemaking process that follows the law, ensures that regulation will not put countless lives at risk, and advances the agency's core mission of protecting human health and the environment, including minimizing Americans' unnecessary exposure to EtO.

> *"This proposed rule shows EPA's strong commitment to protecting people's health while maintaining a stable domestic medical supply chain,"* ***said EPA Administrator Lee Zeldin****. "The Trump EPA is committed to ensuring life-saving medical devices*

remain available for the critical care of America's children, elderly, and all patients without unnecessary exposure to communities."

Congress deliberately designed CAA section 112 with detailed implementation timelines and requirements for residual risk reviews of Maximum Achievable Control Technology (MACT) standards in NESHAP rules. In 2024, however, the Biden-Harris EPA took the unprecedented step of conducting a second, "discretionary" residual risk review despite already completing the residual risk review required by law within eight years of promulgating the NESHAP. This second risk review, done in apparent contravention of the best reading of the statute using an almost decade old risk-based value for EtO, led to the 2024 EtO Commercial Sterilizer Final Rule (2024 NESHAP). During and following the promulgation of the Biden-Harris Administration's 2024 NESHAP, the medical community, industry stakeholders and other federal agencies, including the U.S. Food and Drug Administration, raised serious concerns. These concerns included the feasibility of complying with the more stringent EtO emission standards and the significant impacts the requirements would have on maintaining a strong domestic supply chain for sterilized medical equipment essential to saving American lives. Commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S. every year—or 20 billion medical devices—with no viable alternative on the market.

As a result of the 2024 NESHAP, the Biden-Harris Administration was forced in January 2025 to establish a Presidential exemption process from the administration's own rule due to facilities' inability to meet required standards before compliance deadlines, and the grave risk that the closures of these facilities posed to American lives. In response to legal, scientific and policy concerns, including the critical medical supply chain issue the U.S. faced due to the 2024 NESHAP rule, the Trump EPA issued a press release on March 12, 2025, announcing its reconsideration of the 2024 NESHAP, and on March 21, 2025, formally granted voluntary reconsideration.

With this rule, EPA is proposing that section 112(f)(2) of the CAA prevents EPA from conducting more than the one risk review EPA completed in 2006. Therefore, the second risk review the Biden EPA conducted in 2024 violated the CAA and should never been completed. In line with congressional intent, EPA is proposing to remove the risk-based CAA section 112(f)(2) standards which justified the 2024 NESHAP. EPA is also proposing to change other requirements that were promulgated from the standards, including the requirement to use continuous emission monitoring systems, technology review standards for new aeration room vents (ARV), and requirements for permanent total enclosure. If finalized as proposed, the Trump EPA's rule would give facilities the choice between installing a new monitoring system or making adjustments to the 2024 EtO standards for technology review standards for new ARV where EtO is greater than ten tons per year. These changes better reflect the complexity of facilities and give them the flexibility to work to use safe and effective equipment to sterilize medical tools and devices without compromising clean air for all Americans. EPA is proposing to keep the 2024 NESHAP standards consistent with the CAA and that result in facilities installing attainable emission controls consistent with the latest required technology review. The Trump EPA is committed to following the law exactly as it is written, while also ensuring standards effectively protect human health and the environment.

Since 2016, new information, including new epidemiological studies, advancements in statistical methods related to dose-response modeling have continued to emerge. It is known that EtO is produced within the body via normal processes and additionally from tobacco smoke or other combustion processes. As part of this rulemaking, EPA is seeking comment on new information related to these sources of EtO exposure. EPA anticipates this information would be useful for updating the agency's understanding of EtO exposure and toxicity and determining whether the 2016 EtO IRIS value remains suitable for estimating risk to inform regulatory decision-making, including the proposed amendments

announced today. The agency will also consider comments regarding the Texas Commission of Environmental Quality's 2020 finalized alternative assessment of EtO's toxicity and potential to cause cancer or other alternative values not yet considered by the agency.

EPA estimates that this proposed action would save approximately $630 million in costs over 20 years, or about $43 million annually, not including the immeasurable value of the countless lives that would be saved from lethal or significantly debilitating infections that would result without properly sterilized medical equipment.

EPA will accept public comments on this proposal for 45 days after it is published in the *Federal Register*. EPA will hold a virtual public hearing for this proposed action 15 days after publication in the *Federal Register*.

For more information about this rulemaking and further details about the public hearing, please visit here.

Background

EtO is a colorless gas that is critical to the medical device supply chain. The EtO Commercial Sterilization NESHAP regulates EtO emitted from commercial sterilization facilities. Commercial sterilization covers the sterilizer process that uses EtO to sterilize or fumigate materials such as medical equipment and supplies, spices, and other miscellaneous products and items. This process is designed to eliminate microorganisms including bacteria, viruses, fungi, and protists from products to ensure they are safe for human use and consumption.

EtO sterilization plays a key role in the medical device supply chain, sterilizing a variety of devices ranging from general health care items, such as wound dressings, to specialized devices, such as stents. For many heat- and moisture-sensitive products, EtO sterilization is the only method that effectively sterilizes a product without damaging it.

Today, there are about 90 commercial sterilization facilities owned and operated by approximately 50 companies. EPA issued the original NESHAP under section 112(d) of the CAA in 1994, establishing emission limits for sterilization chamber vents, ARVs, and catalytic oxidizer vents (CEVs). In 2001, EPA revised the NESHAP to remove requirements for CEVs due to equipment failure. In 2006, EPA finalized a residual risk and technology review under CAA sections 112(f)(2) and (d)(6) with no further changes. On April 5, 2024, EPA finalized amendments to the EtO Sterilizers NESHAP based on the results of a residual risk and technology review outside the scope of CAA statutory authority.

Dear Administrator Zeldin:

I am disappointed to learn about the Environmental Protection Agency's policy allowing companies to request a Presidential Exemption to bypass clean air rules.

The law says the president can only issue these kinds of exemptions in very limited cases. That didn't happen here. There was no real analysis, no real justification, just a blanket exemption for polluters who asked via email to emit more mercury and arsenic.

Many coal power plants already meet the Mercury and Air Toxics Standards, so clearly there is no national security problem, and the pollution technology is out there, it works, and it's affordable. Giving exemptions now just rewards the few who chose not to act.

According to your own agency, the 2024 MATS rule delivers $33 million in annual health benefits and $14 million in climate benefits. It has minimal impact on the power grid, with no expected retirements of coal-fired capacity.

The real emergency is the havoc the unlawful policy will wreak on public health with increased non-fatal heart attacks, higher cancer risks, more hospitalizations for respiratory and cardiovascular diseases, and premature deaths. Why give companies the option to opt out of implementing these life-saving measures?

Communities exposed to cancer-causing pollution deserve health protections, not to be ignored in backroom deals. I am asking that the EPA prioritize people over polluter profits.

Sincerely,
Joana Medina

Hi Sarah,

Please see the attached letter from the Montana delegation supporting NorthWestern Energy and Talen Montana's joint request for a Presidential Exemption from the MATS Rule. I have also attached that request for your convenience. Let me know if you have any questions.

Thanks,
Katie

Congress of the United States

Washington, DC 20515

March 31, 2025

The Honorable Lee Zeldin
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, D.C. 20460

Dear Administrator Zeldin,

We write in support of NorthWestern Energy and Talen Montana's request for a two-year Presidential Exemption from the "National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review" (MATS Rule). We appreciate President Trump's Executive Orders to Power the Great American Comeback and an exemption from this overreaching Biden era rule will allow for continued operation of the Colstrip Steam Electric Station (Colstrip) that is a critical baseload power source for Montana.

We previously criticized the Biden administration's Environmental Protection Agency (EPA) on this MATS Rule laying out how this ill-conceived rule oversteps congressionally delegated authority and threatens grid reliability. In fact, the Biden EPA admitted that 42% of the burden of the MATS Rule would fall on Colstrip making it clear that this rule specifically targeted this plant. In order to come into compliance with the MATS Rule, Colstrip would be required to install new fabric filters (baghouses) in addition to its current wet venturi scrubbers. This combination is untested and would come with a significant cost of $500 million for the upgrades making this both technologically and economically "unavailable". Additionally, it is possible that construction would not be completed and operational in time for the MATS Rule's compliance deadlines also making the technology "unavailable" from a timing standpoint. All of this endangers the economic viability of the plant, which if closed, would undermine the region's electric grid as there is insufficient time to plan and construct adequate replacement generation.

Without Colstrip, consumers would bear the burden of higher energy costs and grid unreliability, and its closure would stymie economic development in the region. President Trump, through Executive Order 14156, declared a "national energy emergency" and the Senate on February 26, 2025, voted to affirm that action. This emergency encompasses both energy necessary for military preparedness and defense industries but also for the economic security of the country.

We request that you approve this two-year exemption request to prevent negative impacts on Montana's electric reliability and the increased costs for consumers. Thank you for your work to ensure American energy dominance.

Sincerely,

STEVE DAINES
United States Senator

March 28, 2025

To: U.S. Environmental Protection Agency

VIA E-MAIL (AIRACTION@EPA.GOV)

From: Talen Montana, LLC
NorthWestern Corporation d/b/a NorthWestern Energy

Subject: Request for Presidential Exemption from National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 89 Fed. Reg. 38508 (May 7, 2024): Colstrip Steam Electric Station, Units 3 and 4

Docket ID No.: EPA-HQ-OAR-2018-0794

I. EXECUTIVE SUMMARY

The emission standard subject to this Request for Presidential Exemption (Request) is the National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 89 Fed. Reg. 38508 (May 7, 2024) (2024 MATS Rule, or Rule). The 2024 MATS Rule set an emission limit of 0.010 lb/MMBtu limit for filterable particulate matter (fPM) emissions. *Id.* at 38530; *see also* 40 C.F.R. Pt. 63, Subpt. UUUUU, Tbl. 2 ("On or after July 6, 2027: 1.0E-2 lb/MMBtu").

The affected source is the Colstrip Steam Electric Station, Units 3 and 4, located in Rosebud County, Montana (Colstrip).

Talen Montana, LLC (Talen), the operator and part owner of Colstrip, and NorthWestern Corporation d/b/a NorthWestern Energy (NorthWestern), part owner of Colstrip, jointly request that Colstrip be exempt from the 2024 MATS Rule for two years,[1] running from the later of the Rule's compliance deadline of July 6, 2027, or July 6, 2028, if the State of Montana grants a one-year extension permissible under Section 112 of the CAA.

The President should grant this request under Section 112(i)(4) of the Clean Air Act (CAA) because (1) the technology to implement the standard is not available, and (2) the extension is in the national security interests of the United States.

Technology. The technology to implement the 2024 MATS Rule for Colstrip is "not available" from an engineering, cost, and timing standpoint.

- As applied to Colstrip, the Rule requires an untested and unproven sequencing of emission control technologies. Colstrip already employs wet venturi scrubbers, which presently achieve 99.6% control of fPM. The Biden EPA's 2024 MATS Rule would require control

[1] This two-year exemption may be extended for more than one additional period. 42 U.S.C. § 7412(i)(4).

efficiency to increase from 99.6% to 99.8%, which cannot be achieved by wet venturi scrubber technology. Colstrip would be required to install new fabric filters (also known as baghouses) downstream of the wet venturi scrubbers. This combination is unproven, untested, and raises significant risks to the operation of Colstrip and its ability to timely achieve compliance. For this reason alone, the technology necessary to increase Colstrip's PM control from 99.6% to 99.8% (as required by the 2024 MATS rule) is technologically "unavailable."

- Moreover, based on recent developments in project schedule and costs, a project to install the baghouses would cost over $500 million. These costs are uneconomic, and with respect to NorthWestern, may be unrecoverable, or not fully recoverable in electric rates. Given these costs and technological uncertainty, there is danger that Colstrip would retire instead of installing controls that could cause severe operational issues. As a result, the installation of baghouses is economically "unavailable."

- Additionally, even if Talen Montana and NorthWestern were to take the risk, there is a significant likelihood that the baghouses could not be installed and be operational to meet the compliance requirements until early 2029, far past the statutory deadline. These circumstances make the technology "unavailable" from a timing perspective for Colstrip.

National security. It would be "in the national security interests of the United States" to provide the requested exemption to Colstrip from the 2024 MATS Rule.

- Multiple Executive Orders issued by the President have reaffirmed that removing any and all regulatory burdens restricting power plants' operation would advance various national security interests.

- This is especially the case for Colstrip, a core facility that powers the western part of the United States and is a major economic driver for Montana. Colstrip is critical to grid reliability and resource adequacy, and disruption of operations or the plant's forced retirement in the face of the 2024 MATS Rule would harm the national security interests of the United States because replacement power could not be easily procured in the region. As but one example, reserve power margins are already low (10%, and are projected to worsen) in the western parts of the United States—which house numerous military bases, such as the Malmstrom Air Force Base near Great Falls, Montana. An energy emergency already exists in the western United States, as declared by one of the Executive Orders.

II. BACKGROUND

Section 112 of the CAA regulates hazardous air pollutants such as mercury or non-mercury metals. Power plants are subject to Section 112 only if EPA finds it "appropriate and necessary." 42 U.S.C. § 7412(n)(1)(A). These standards undergo a review every eight years. *Id.* § 7412(f). EPA under the first Trump Administration completed this review and determined that changes to

the existing standards were ***not*** "necessary." 85 Fed. Reg. 31286 (May 22, 2020). EPA under the Biden Administration agreed that the existing standards provide an adequate margin of safety, and further concluded that the Rule will impose far higher costs than quantifiable benefits. Nonetheless, the 2024 MATS Rule required coal-fired power plants to reduce fPM emissions by 66%. 89 Fed. Reg. 38508. Importantly, EPA admitted in the administrative record that almost half of the regulatory burden from the entire 2024 MATS Rule would fall on Colstrip. *Id.*at 38533 ("42 percent"). Talen Montana and NorthWestern encouraged EPA via the formal regulatory comment process to make changes to the Rule to avoid this outcome for Colstrip, their respective Comments included in this Request as Exhibits 1 and 2. Those calls for reasonable change were ignored by the Biden EPA.

Talen Montana and NorthWestern challenged the Rule. *Talen Montana, LLC v. EPA*, No. 24-1190 (D.C. Cir.); *NorthWestern Corp. v. EPA*, No. 24-1217 (D.C. Cir.); *see also North Dakota v. EPA*, No. 24-1119 (D.C. Cir.) (lead case). Talen Montana and NorthWestern requested the court to judicially stay the 2024 MATS Rule, but the court denied the request.

The legal challenges to the 2024 MATS Rule have been held in abeyance in light of the Trump Administration's swift action. But with no judicial stay of the Rule, Colstrip is expected to comply with all emission standards set by the 2024 MATS Rule by July 6, 2027, or one year later if the state provides a statutory extension. Because construction of control technologies takes significant time, power plants such as Colstrip must decide soon whether to make expensive and uncertain investments to comply with the Rule, with no assurance of timely compliance. Colstrip has diligently moved forward with the design of potential control technology, but it has not been able to develop assurance that it can effectively, economically, or in a timely manner comply with the Rule. Meanwhile, the time is soon coming for decisions to be made and expenditures to rise steeply. Moreover, the Colstrip owners face this major investment decision with significant challenges to complying with the Section 111 Greenhouse Gas Rule, 89 Fed. Reg. 39798 (May 9, 2024) (GHG Rule), on the horizon, in just a few short years after the 2024 MATS Rule compliance is due.

On March 12, 2025, EPA published the "Mercury and Air Toxics Standards (MATS): Powering the Great American Comeback Fact Sheet" (Fact Sheet). In this Fact Sheet, the Agency stated that it seeks to reconsider the 2024 MATS Rule. The Fact Sheet and EPA's Press Release issued the same day alerted the public and the regulated community to Section 112(i)(4) of the Clean Air Act (CAA), which allows the President of the United States to grant a compliance exemption of up to two years "if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so," 42 U.S.C. § 7412(i)(4). EPA notified the public in the Fact Sheet that any source interested in such exemption from the 2024 MATS Rule "should provide their recommendations to EPA by March 31, 2025." EPA stated that sources only need to provide why the technology is unavailable and why it is in the national security interest for an exemption. EPA's Press Release further explained that the Agency is considering exemptions via CAA Section 112(i)(4) while the Agency goes through the rulemaking process to reconsider the Rule.

III. REQUEST FOR EXEMPTION

In CAA Section 112(i)(4), Congress expressly provided the President ***the discretion*** to determine whether a technology is "not available" and whether exempting a stationary source would be in the "national security interests." In exercising this discretion, the President should consider technological unavailability and national security broadly.

As set forth in the Executive Summary, the control technology for Colstrip to meet the standard is unavailable for the following reasons:

- ***The control technology is technologically unavailable.*** The application of new baghouses following wet venturi scrubbers is unproven and untested and comes with significant risks to the operation of Colstrip.

- ***The control technology is economically unavailable.*** Applying baghouse technology to Colstrip is prohibitively expensive. When the Rule was finalized, Talen Montana estimated the compliance cost to be around $350 million. Currently the cost estimates exceed $500 million, plus operation and maintenance costs of $15 million annually. Market realities, such as difficulties in funding and rate recovery, make such a project uneconomic meaning that it is more likely that Colstrip will shut down.

- ***The control technology is unavailable from a timing standpoint.*** At a minimum, the technology to control emissions to the levels required within the statutory timelines simply does not exist. No control technology could be installed by July 6, 2027, the compliance date set by the 2024 MATS Rule. A significant risk remains that even a one-year extension would not be enough due to the unique financial and technological constraints Colstrip faces.

The President should account for the following in determining that exempting Colstrip from the Rule would advance national security interests.

- At least two Executive Orders have already declared that any emergency suspension of regulations hindering energy production would advance national security. *See* Executive Order 14154 & Executive Order 14156.

- Exempting Colstrip from the Rule falls squarely within advancing national interests because Colstrip is essential in providing much needed, reliable electricity in the western region of the United States, where there is an abundance of critical military infrastructure. Colstrip is also a core economic driver for Montana.

A. The technology to implement the 2024 MATS Rule specifically for Colstrip is unavailable.

Concerning technological availability, CAA Section 112(i)(4) states: "The President may exempt any stationary source from compliance with any standard or limitation under this section for a period of not more than 2 years if the President determines that the technology to implement such standard is not available." 42 U.S.C. § 7412(i)(4). The President should exempt Colstrip pursuant to CAA Section 112(i)(4) because Colstrip does not have a practically available technology to implement the 2024 MATS Rule.

1. Application of baghouses to Colstrip is technologically unproven and untested given Colstrip's existing pollution control technology.

It is true that baghouses, for ***new*** power plants, are widely available because the control technology is installed after the combustion device (the boiler). But in the case of Colstrip, the baghouse must be installed after the already-existing wet venturi scrubbers, which the plant currently uses to control fPM emissions and sulfur dioxide (SO_2). To utilize only a baghouse would require a complete redesign of the facility and likely a new stack, which would be cost prohibitive. The wet venturi scrubbers already capture 99.6% of the fPM, but to capture the remaining 0.2% as required by the 2024 MATS Rule, the baghouses would be needed as an addition to the backend of the wet venturi scrubbers, which would be a unique and unproven combination.

While this arrangement may be theoretically possible, it is challenging and untested in practice. The combination of wet venturi scrubbers followed by baghouses increases the risk that the condensed water droplets (from the scrubbers) would meet the fly ash emitted by the plant, creating particles similar to concrete on the filter bags, thereby crippling the baghouse. Effectively, the combination increases the likelihood that the entire facility gets clogged with concrete particles. Additionally, once the bags are plugged, they must be replaced, and a significant number of plugged bags could result in emission exceedances, the plant being derated, or the plant being forced offline. Talen Montana is unaware of such control technologies ever being applied together in this arrangement at any other facility in the entire United States. As such, there is no proof that such technology is available to capture the small, remaining amount of particulate that exists following the installed wet venturi scrubbers. And because of the short compliance deadline, Colstrip would be required to construct, test, and implement this unprecedented combination on the fly, potentially spending at least $500 million only to have the revamped control system fail. As a result, the technology to comply with the Rule is technologically unavailable.

2. The technology is financially unavailable.

When Talen Montana requested a judicial stay of the 2024 MATS Rule, it submitted a supporting declaration (Lebsack Declaration), included in this request as Exhibit 3.[2] In this declaration, Talen Montana stated that a project to comply with the emission standards would cost "$350 million,"[3] with a "$15 million annually" in operation and maintenance costs. Lebsack Declaration ¶¶ 16, 34. These cost figures already presented challenges to Colstrip, as reflected by the litigation and request for judicial stay.

With the Rule now in effect, Talen Montana has conducted further engineering studies to get a more accurate assessment of the project costs. The most recent, up-to-date engineering estimates exceed $500 million. This new projection accounts for sole source risk allowance, more accurate wage rates, structural steel install rates, scaffolding costs, duct installation costs, and total delivery costs—all of which were not accounted for in studies leading up to the Lebsack Declaration.

These costs will only increase. Because Colstrip cannot handle this project in-house, it must work with a third-party vendor. Colstrip is currently waiting on a turnkey proposal, but it is expected that costs will increase by up to 30%. This is because it will be the vendor that must procure the materials, assume liability, and hire contractors.

Such cost figures are exorbitant and burdensome to the point that it is more likely that some owners of Colstrip will forego installing the control technology altogether, and instead consider shutting down the plant. At least three market conditions cause the installation of baghouses to be financially unavailable.

First, a significant number of Colstrip's co-owners might not be interested in funding such a project. As explained in the Lebsack Declaration, some of Colstrip's co-owners are located in the Pacific Northwest. And because of shifting political sentiments against coal in the region, these co-owners would not be interested in any involvement that would allow a coal-fired power plant to continue operating. For example, the public utility commissions in Oregon and Washington do not want any electricity powered by coal. In fact, the State of Washington passed a statute that would impose ***penalties*** on utilities that provide coal-fired electricity to certain Washington customers after December 31, 2025. Wash. Rev. Code §§ 19.405.030(1)(a), (4) and 19.405.090(1)(a)(i). With express disapprovals from Pacific Northwest utility commissions, it

---

[2] Of note, even opponents to the judicial stay carefully tailored their argument and implicitly recognized Colstrip's unique constraints and challenges. They claimed that any judicial stay in favor of Colstrip should not be extended to others. *See, e.g.*, EPA Opp'n 50, *Talen Montana, LLC v. EPA* (D.C. Cir. filed July 22, 2024), ECF No. 2065849; Env't Intervenors Opp'n 13 (D.C. Cir. filed July 22, 2024), ECF No. 2065869.

[3] The Lebsack Declaration includes an "Attachment A," which provides select excerpts from a report prepared by technical consultants that assessed the cost breakdown. Table 1-1 of Attachment A (located in page 1-9) provides a summary of the cost breakdown.

would be difficult for these co-owners to justify any project that would let Colstrip to continue operate. Lebsack Declaration 9 10.

Second, it is possible that public utility commissions disapprove rate recovery for the project. This is exactly the conundrum NorthWestern currently faces as a regulated utility. In the comments submitted during the rulemaking period for the 2024 MATS Rule, NorthWestern expressly flagged this scenario as a grave area of concern. NorthWestern already planned on investing over $2.4 billion in electricity infrastructure improvements, which has spurred significant rate recovery controversy. When NorthWestern filed its comments, the Montana Public Service Commission was weighing a 28% residential electricity rate settlement that did not account for the 2024 MATS Rule. NorthWestern Comments 20 21. The Commission largely approved the settlement, allowing NorthWestern to recover for its past investments. However, to maintain the utility's health, NorthWestern filed another rate review in Summer 2024, seeking recovery of essential investments made through December 2024 to serve customers. There has been no final decision, and that filing presents no costs directly attributable to the construction of a baghouse itself.

Third, the future of EPA's GHG Rule further complicates the feasibility of such a project that the 2024 MATS Rule demands. While the Trump Administration has expressed intent to reconsider and possibly rescind the GHG Rule, it is still on the books. And as expressed by Talen Montana and NorthWestern, under this rule, Colstrip has no option but to shut down the plant by 2031. Lebsack Declaration ¶¶ 41–43.[4] This is because Colstrip cannot switch to burning natural gas instead of coal as required by the GHG Rule. Nor could Colstrip switch to natural gas to comply with the 2024 MATS Rule. *See id.* If the GHG Rule forces Colstrip to shut down, Colstrip's cost-recovery period for any technology installment would greatly decrease. While it is true that this particular concern may not materialize, it is still a financial uncertainty and a material factor that any investor must consider when deciding to commit to a project.

3. The technology is not available by July 6, 2027, and there is a significant risk that a one-year extension would be insufficient.

The 2024 MATS Rule directs all applicable facilities to comply with the new emission standard by July 6, 2027. *See, e.g.*, 40 C.F.R. § 63.9991 ("Before July 6, 2027, you must meet each operating limit in . . . this subpart . . . ."); 89 Fed. Reg. at 38508 (setting the effective date of the 2024 MATS Rule to be "July 8, 2024"); 42 U.S.C. § 7412(i)(3)(A) (directing EPA to "establish a compliance date . . . in no event later than 3 years after the effective date of such standard"). This deadline could be extended by one year by a permitting authority. 42 U.S.C. § 7412(i)(3)(B). Colstrip cannot meet the fPM emission standard of 0.010 lb/MMBtu unless it installs baghouses, a major infrastructure addition to the facility.

[4] The Lebsack Declaration includes an "Attachment B," which is a separate declaration in support of judicially staying the GHG Rule. *See West Virginia v. EPA*, No. 24-1120 (D.C. Cir.).

Meeting the July 6, 2027 compliance timeline always has been ambitious, if not impossible. Such a project, at an absolute minimum, would take 36 to 42 months to complete. Construction alone would take two years because the first year would be devoted solely to foundation work. The time necessary for preliminary investigation and design finalization prior to construction would add an additional two and a half years. This timeline tracks Colstrip's experience—the facility's engineers had commenced preliminary investigation on May 1, 2023, and only around now is the plant moving onto the design phase, projected to last another year.

When requesting a judicial stay of the 2024 MATS Rule, Talen Montana explained how the only way to meet the Rule's deadline is if detailed engineering and design work begin in the fall of 2024, and construction commences in the spring of 2025. "[E]ven if the project could begin in the fall of 2024, it will be a challenge to complete by the compliance deadline of July 8, 2027, and may still be tight for a compliance even if granted a one-year deadline extension under the rule." Lebsack Declaration ¶ 37.

These have always been best-case projections with zero margin of error. Multiple complications could delay the project. Due to its location in Montana, any construction project for Colstrip is subject to weather extremes. Cold temperature often makes concrete pouring impossible. Staff would be unable to work for an extended period once temperatures fall to 30 degrees or below or once it snows extensively.

Labor availability is also an issue. The closest "large" city is Billings, Montana, 100 miles away. It is challenging to provide temporary lodging for all workers involved in a project of this scope. In fact, skilled labor in this specific field (of installing baghouses) is limited due to the fact that most projects of this kind occurred in 2012 (when the original MATS rule was promulgated), and specialists have either retired or moved on to work on other projects. Even if labor could be procured, it will be difficult to staff personnel in both the baghouse construction project and normal plant maintenance activities. Inherent tradeoffs must be made where allocating boilermakers to the baghouse could cause labor shortage in the normal operation of the plant.

Lastly, inherent supply chain uncertainty lingers. The project requires significant amounts of steel and electrical components (such as transformers, motors, and switch gear). All of these are imported, and procurement is becoming challenging due to market conditions.

And while Talen Montana has been diligent in its efforts to ensure Colstrip's compliance with the Rule, complications have pushed back these timelines. As discussed *supra* pages 6 7, there are significant challenges funding a project of such magnitude where the project has the potential to create severe technological complications and sufficient time does not exist to recover costs (due to the Biden EPA's GHG Rule). Additionally, because the co-owners hold divergent opinions on whether such funding is justified in the first place, any agreement would likely come in January 2026 at the earliest (after certain anticipated ownership changes). Colstrip's engineers project that, as soon as funding is available the first day of 2026, the entire project could potentially be completed by Spring of 2029. That still misses the compliance deadline even if the Montana

Department of Environmental Quality grants a one-year extension that is the maximum extension allowable under law. As a result, the project is unavailable within the regulatory timeframe.

B. It is in the "national security interests of the United States" to exempt Colstrip from compliance with the 2024 MATS Rule.

The statute requires the President to determine that exempting Colstrip from the 2024 MATS Rule "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4).

As a threshold matter, Presidential determinations on national security receive the utmost deference. "[T]he Supreme Court has always been reluctant to second-guess the Executive Branch on matters of national security—especially where Congress has not acted to restrict it." *Lee v. Garland*, 120 F.4th 880, 889 (D.C. Cir. 2024); *see also Haig v. Agee*, 453 U.S. 280, 291 (1981) ("[I]n the areas of . . . national security, . . . congressional silence is not to be equated with congressional disapproval."); *United States v. Curtiss-Wright Exp. Corp.*, 299 U.S. 304, 320 (1936) (discussing "the very delicate, plenary and exclusive power of the President as the sole organ of the federal government in the field of international relations").[5]

And the President has spoken. Through Executive Order 14156, the President declared a "national energy emergency" concerning energy resources and costs. 90 Fed. Reg. 8433 (Jan. 29, 2025) ("Declaring a National Energy Emergency"). According to the President, "a reliable, diversified, and affordable supply of energy" is necessary for the nation's "defense industries" and "military preparedness." *Id.* Further, "an affordable and reliable domestic supply of energy is a fundamental requirement for the national and economic security of any nation," especially when "hostile state and non-state foreign actors have targeted our domestic energy infrastructure, [and] weaponized our reliance on foreign energy." *Id.*

The national security implications of reliable, unrestrained energy production echoes in Executive Order 14154 as well. 90 Fed. Reg. 8353 (Jan. 29, 2025) ("Unleashing American Energy"). Through this Executive Order, the President determined that various regulations have impeded resource development, "limited the generation of reliable and affordable electricity," and inflicted high energy costs, all of which "weaken[s] our national security." *Id.* Thus, the President determined that it is "in the national interest to unleash America's affordable and reliable energy and natural resources" which, in turn, will "rebuild our Nation's economic and military security." *Id.*

As such, the President directed all agencies to "exercise any lawful emergency authorities" to facilitate "production, transportation, refining, and generation of domestic energy resources," including "in and through the West Coast of the United States." 90 Fed. Reg. at 8434. Likewise, the President directed all agencies to "suspend, revise, or rescind" all regulations that "impose an

[5] Because CAA Section 112(i)(4) is fundamentally concerned with national security, this same high level of discretion must be afforded to Presidential determinations on all elements of the Section, including determinations that a particular control technology is "not available."

undue burden" on the use of coal as "expeditiously as possible" in the interest of national security. *See* 90 Fed. Reg. at 8353 54 (discussing the Executive Order's policy goals of "reduc[ing] the global influence of malign and adversarial states," and "protect[ing] the United States's economic and national security and military preparedness by ensuring . . . an abundant supply of reliable energy").

The slew of passages in the Executive Orders make clear: The President has already determined that ***any*** reduction of regulatory burden when it comes to energy production including an emergency exemption of the 2024 MATS Rule for any power plant—would be in the national security interest. This is unsurprising. Coal still supplies 16% of America's electricity. U.S. Energy Information Administration, *What is U.S. electricity generation by energy source?* (Feb. 2024).[6] This share is especially important because coal provides efficient, low-cost, reliable 24/7 baseload power. In doing so, it stabilizes electrical grids under increasing threats. Moreover, the United States has abundant coal reserves, providing a secure and reliable supply, and generating domestic jobs and economic activity.

The continued operation of Colstrip fits comfortably into President Trump's directives, as evinced by the Executive Orders discussed. Therefore, specifically exempting Colstrip from the 2024 MATS Rule would be in the national security interests of the United States.

As Talen Montana submitted in its comments to EPA when the 2024 MATS Rule was proposed, "Colstrip is one of Montana's most important energy assets, especially as demand for reliable baseload power in the western U.S. continues to grow." Talen Montana Comments 7. Colstrip "is vital to ensuring that Montanans have affordable and reliability electricity, especially during peak winter and summer months." *Id.*

NorthWestern, the largest public utility in Montana, also extensively commented on Colstrip's importance to the grid. In the lawsuit challenging the Rule and as part of the request for a judicial stay, NorthWestern submitted a declaration as well (Hines Declaration), included in this recommendation as Exhibit 4. Both these documents flag the importance of Colstrip to the nation's grid and electricity supply, and how the 2024 MATS Rule hinders national security by disrupting Colstrip's operations.

- The 2024 MATS Rule will increase electricity rates for Montana ratepayers. Hines Declaration 7 10; NorthWestern Comments 21. In fact, the diversion of funds alone for compliance with the Rule would complicate meeting generation demand. NorthWestern Comments 2–3.

- Replacement electrical generation and transmission capacity does not exist for Colstrip. In other words, Colstrip is truly irreplaceable from an electricity production standpoint, at

[6] Available at https://www.eia.gov/tools/faqs/faq.php?id=427&t=3.

least in the near future. Hines Declaration ¶¶ 45–52; NorthWestern Comments 13–16 ("Transmission limitations on the ability to import power").

- "Colstrip plays a critical voltage-maintenance function." Hines Declaration ¶ 65. Without Colstrip and its uninterrupted operation, there is a significant blackout risks which would affect businesses and "important infrastructure." *Id.* ¶¶ 66, 67. This is especially the case because NorthWestern, as a regulated utility, made targeted capital investments improving grid reliability, which had not planned for the 2024 MATS Rule and its costs. NorthWestern Comments 21–22.

The economic consequences of grid disruptions are severe and well-documented, and they pose a national security concern in and of themselves. If Colstrip is forced to reduce or cease operations because it cannot timely comply with the 2024 MATS Rule, there would be an increased risk of the kinds of devastating disruptions that have recently hit California and Texas. Hines Declaration ¶¶ 52, 64 67. All these issues warrant heightened attention when considering military readiness. Colstrip powers the northwestern region generally, including the military bases located in the area. The State of Washington alone is home to nine known military bases. And Oregon, Montana, and Idaho collectively house seven more. Any risk to power disruption in and around these bases affect core national security issues.

External sources confirm Talen Montana and NorthWestern's grid reliability concerns. The Western Power Pool projects that for July to August, the planning reserve margin falls below 10% for most of 2026 to 2029. The North American Electric Reliability Corporation (NERC) projects that reserve margins reach levels of 10% or below ***overall*** starting in 2031. NERC, *2024 Long Term Reliability Assessment* 127 (Dec. 2024).[7]

Lastly, Colstrip is also vital to protecting "economic security" as expressed in the two Executive Orders discussed above. *See* 90 Fed. Reg. at 8433; 90 Fed. Reg. at 8353. Colstrip supports more than 3,000 jobs in the local economy, provides $240.3 million in income for Montana households, and about $102.8 million in state tax revenue to Montana. Indeed, it has been calculated that Montana benefits in economic activity worth over $1 billion from Colstrip in the form of electricity costs and reliability, inter-region trade, and lower state government spending. Lebsack Declaration ¶ 58 (including Attachment C);[8] Talen Montana Comments 6 7.

[8] The Lebsack Declaration includes an "Attachment C," which is a study of Colstrip's economic contributions prepared by Dr. Patrick M. Barkey, Ph.D.

IV. CONCLUSION

Talen Montana and NorthWestern appreciate the opportunity to submit its request to exempt Colstrip from the 2024 MATS Rule. Talen Montana and NorthWestern respectfully request that the President exercise his discretion to exempt Colstrip from the 2024 MATS Rule.

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Dear Principal Deputy Assistant Administrator Tardif,

Please find attached two follow-up letters from Dow and Dow's subsidiary, Union Carbide, reiterating our immediate request for an extension of the compliance date for the HON. Thank you again for meeting with us in February to discuss this rule and the urgent nature of this request. As we mentioned in our meeting, and in our comments and meetings with EPA during the HON rulemaking process, the two-year compliance deadline is not practical for the types of projects needed to comply with this rule. That has been confirmed by our project teams and further detailed in the attached letters. In addition, we express support for the ACC and AFPM petition for reconsideration due to the technically unachievable requirements in the final rule, also further detailed in the attachments.

Please contact me with any questions or information you may need to assist with this request. Thank you for your attention to this.

Best regards,
Kari

RE: Request for Extension of the Compliance Deadline and Letter of Support for ACC/AFPM Petition for Reconsideration In Re: New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry (89 Fed. Reg. 42932). Docket ID: EPA-HQ-OAR-2022-0730 ("HON rule").

Dear Principal Deputy Assistant Administrator Tardif:

We are writing on behalf of The Dow Chemical Company ("Dow") to thank you for meeting with us on February 18[th] to discuss our concerns with the final HON rule and express our support for the petition for reconsideration filed by the American Chemistry Council ("ACC") and the American Fuel & Petrochemical Manufacturers ("AFPM") urging the Environmental Protection Agency ("EPA") to reconsider its final HON rule. First and foremost, Dow requests immediate relief and a one-year extension to the impractical compliance deadlines, which are fast approaching, as the final rule's deadlines are unrealistic and cannot be met. Without an extension, this will lead to facility shutdowns and jeopardize important ethylene oxide supply chains including military jet fuels, aircraft deicing fluids, semiconductors, pharmaceuticals, and sterilization.

We also support the call to revoke the regulatory provisions promulgated under Clean Air Act section 112(f) because they exceed EPA's statutory authority and do not comply with the requirements of reasoned decision-making. While the petition filed by ACC and AFPM speaks to the general need for immediate relief and the rule's consequences from a national perspective, we wanted to ensure that you also had input from a regulated entity that is subject to EPA's final HON rule. The final rule's deadlines are unrealistic and there is a need for immediate relief. The final rule also harms the national interest because it exceeds EPA's statutory authority and imposes undue burdens and costs that impede private enterprise and far outweigh any public benefit.

Dow and its subsidiaries have long been committed to high operational and safety practices that consistently meet or exceed regulations and applicable laws wherever it operates. Dow works proactively and collaboratively with regulators to ensure compliance with all applicable federal, state, and local regulations and continues to advocate for sensible, risk-based emissions standards based on the best available science. Long before EPA promulgated its final HON rule, Dow established an Ethylene Oxide (EO) Emissions Reduction Program overseen by the Corporate EO Steering Team, which consists of members from the company's business, engineering, procurement, strategy, and leadership teams. The Corporate EO Steering Team has focused on five key steps (1) compliance (establishing confidence in EO emission data); (2) robust operation (preventing EO releases and limit exceedances); (3) risk reduction (preventing unplanned events resulting in EO emissions); (4) operating discipline (accomplishing sustained improvement); and (5) communications. Dow's efforts to implement these steps significantly decreased EO emissions. In 2021, Dow's EO emissions declined by more than 70% from a 2018 baseline[1]. Dow has also engaged with its local communities to listen to the concerns, questions, and needs of community members.

EPA Should Extend Upcoming Deadlines

Dow and its subsidiary (which will send its own separate communication), have submitted requests to extend the compliance deadline of July 15, 2026 by one year for five of their twenty-eight projects that are being implemented to comply with the ethylene oxide provisions of the HON rule. We are continuing to work with EPA on their request for more information related to these extension requests.

In preparing to comply with the HON rule, Dow has undertaken an extensive amount of work to sample and test individual process vents and process wastewater streams to determine if these sources meet the definition of "In Ethylene Oxide Service". Dow has also expended significant financial resources on project scoping and engineering for all the projects, and devoting significant employee time, including new hires and reallocation of human capital away from other workstreams. Beginning in April 2024, Dow commenced comprehensive sampling and monitoring at two of its facilities (and two of its subsidiary's facilities) to identify which projects would need upgrades to comply with the HON rule and which projects are "in ethylene oxide service" (meaning that the projects include equipment that processes ethylene oxide ("EO")). Because of the sheer number of product lines and the vastness of Dow equipment that is involved in EO-related processes, those efforts remain ongoing. The breadth of projects that Dow must implement to comply with the final rule is constantly evolving, as Dow has been forced to add and subtract projects as new sampling information becomes available.

Dow is required to undertake an extensive assessment process to determine whether equipment is in EO service, and how Dow can and should upgrade its equipment to meet the HON rule's extraordinarily stringent limits. That process requires (1) testing vents for flow rate and composition; (2) scoping out potential solutions to bring EO emissions into compliance with

the final rule; and (3) sourcing bids from external vendors who may be able to develop the required technology. Each of these steps presents significant practical challenges. For example, there are few vendors who are qualified to build the necessary devices and, because every EO emitting industry needs to comply simultaneously, industry faces a significant backlog. Similarly, some of the technologies needed to comply with EPA's requirements have known reliability issues.

In addition to this detailed assessment process, each of the five separate projects, for which Dow seeks an extension, independently require (1) six months to determine if equipment is in EO service; (2) 12 months for front-end engineering design; (3) nine months of detailed design engineering; (4) 19 months for procurement of vendor bids, vendor questions and selection, equipment fabrication and delivery (overlaps with front end engineering design); (5) ten months for construction of required equipment, piping, and instrumentation (overlaps with detailed design engineering); and (6) 1-1.5 months to develop operating procedures, commissioning the equipment, and placing it into service. This information was provided to EPA several times with our comments on the rule and in meetings with the Agency.

Without an extension, Dow will not be able to meet the compliance timeline and potentially will have to shut down some of its facilities until we complete these projects. Dow will also be forced to implement projects at a rate that increases safety risks; diverts resources from other previously planned projects; and limits Dow's ability to innovate and develop new products to help the American people in everyday life. Therefore, an extension is needed ***now*** to avoid expending significant resources to comply with the final rule's unreasonable deadlines.

EPA Should Grant the Motion for Reconsideration

EO serves as an important chemical precursor used to produce a wide range of other chemicals, including home and personal care products, pharmaceuticals, agricultural products, antifreeze, military jet fuels, plastics, detergents, and textiles. It also performs a crucial role as a sterilizing agent for heat-sensitive medical equipment that cannot be sterilized with steam or radiation. Dow estimates that its U.S. manufactured EO supplies the requirements of 75% of the U.S. government's jet fuel additive, 35% of the osmotic laxative market, 25% of the automotive brake fluid market, and nearly 10% of aircraft deicing fluids – all essential products required for national safety and the smooth functioning of the U.S. economy.

Dow may have to shut down some facilities that produce or use ethylene oxide in the second half of 2026 to comply with the HON rule, which is likely to have downstream impacts on the derivatives of EO with consequences for all of the sectors mentioned above. If Dow were to shut down the facilities simultaneously, the cascading impacts of the loss of EO production would be widespread and felt throughout the U.S., both economically and from an essential products perspective. During these outages, hourly employees will also face loss of work, negatively impacting the local community and individual American families' households.

There are several provisions of the final rule that are untenable. Two of the most challenging are EPA's decision to regulate process wastewater streams at a level of 1 ppmw without any allowance for low mass flows or any consideration that some of the ethylene oxide in the process wastewater streams will react with water to form ethylene glycol. EPA's assumption that 50% of the ethylene oxide in the wastewater streams will be emitted to the atmosphere is much higher than fraction emitted values calculated by Dow's estimating tools, which predict 5 to 15% will be emitted. These wastewater streams require additional unit operations to react or remove the ethylene oxide from the process wastewater. In addition, EPA's decision to regulate small process vent streams at a level of 1 ppmv without regard to the stream pressure, flowrate or net heating value also create engineering challenges when determining how to collect and transport these streams to a control device and then what type of control system to design.

In addition to these engineering concerns, EPA has finalized requirements that would actually increase ethylene oxide emissions. For example, EPA has eliminated the Delay of Repair option for addressing small equipment leaks. This means that if a manufacturer cannot fix a small leak within fifteen days, the entire plant must be shut down to address that leak. By removing this delay of repair option, manufacturers estimate this could lead to 4-6 more plant shutdowns a year. Shutting down and starting up plants would emit more ethylene oxide emissions than allowing a small leak to continue until it can be safely fixed. And this may not only impact the ethylene oxide unit but could also force units offline that rely on ethylene oxide as an input in making other products.

In addition, EPA has finalized requirements that are not technically feasible. For thermal oxidizers, EPA is requiring continuous monitoring of flue gas. Flue gas temperatures are 1300 1600°F for smaller thermal oxidizers with no heat recovery. Technology is not available to continuously measure flowrates at these high temperatures. This makes compliance impossible.

EPA has finalized a fenceline monitoring action level of 0.2 μ/m^3 of ethylene oxide based on a new ambient air monitoring method (Method 327). There are many technical concerns with the new Method 327 and the ability of commercial labs to run the new method and analyze the number of canisters required for each site. The final action level is also below background levels taken at areas where there is no ethylene oxide being manufactured or used. This makes compliance impossible.

Finally, these requirements are all based on an overly conservative scientific assessment. EPA is relying on a risk value from the EPA EO IRIS assessment, which has been challenged as flawed and overly conservative. Further, EPA is utilizing this IRIS value without taking other scientific and peer-reviewed data into consideration. The IRIS risk value is 23,000 times lower than what is naturally occurring in the human body and below background levels.[ii]

Despite the critical role EO plays in everyday life and the substantial work Dow has taken to reduce EO emissions, EPA refused to incorporate several of Dow's comments into the HON rule. Nor has it adequately addressed the objections that EPA has exceeded its authority and imposed burdensome regulations that do not reflect the best and most appropriate reading of the statutory requirements. The rule imposes significant costs that are not outweighed by the expected public benefits, and it will harm national interests. As a result, EPA should grant the petition for reconsideration and take time to impose a HON rule that is appropriate, cost-effective, and consistent with the national interest.

Respectfully submitted,

Louis Vega

RE: Request for Extension of the Compliance Deadline and Letter of Support for ACC/AFPM Petition for Reconsideration In Re: New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry (89 Fed. Reg. 42932). Docket ID: EPA-HQ-OAR-2022-0730 ("HON rule").

Dear Principal Deputy Assistant Administrator Tardif:

We are writing on behalf of Union Carbide Corporation ("UCC"), a wholly owned subsidiary of The Dow Chemical Company to express our support for the petition for reconsideration filed by the American Chemistry Council ("ACC") and the American Fuel & Petrochemical Manufacturers ("AFPM") urging the Environmental Protection Agency ("EPA") to reconsider its final HON rule. First and foremost, UCC requests immediate relief and a one-year extension to the impractical compliance deadlines, which are fast approaching, as the final rule's deadlines are unrealistic and cannot be met. Without an extension, this will lead to facility shutdowns and jeopardize important ethylene oxide supply chains including military jet fuels, aircraft deicing fluids, semiconductors, pharmaceuticals, and sterilization.

We also support the call to revoke the regulatory provisions promulgated under Clean Air Act section 112(f) because they exceed EPA's statutory authority and do not comply with the requirements of reasoned decision-making. While the petition filed by ACC and AFPM speaks to the general need for immediate relief and the rule's consequences from a national perspective, we wanted to ensure that you also had input from a regulated entity that is subject to EPA's final HON rule. The final rule's deadlines are unrealistic and there is a need for immediate relief. The final rule also harms the national interest because it exceeds EPA's statutory authority and imposes undue burdens and costs that impede private enterprise and far outweigh any public benefit.

EPA Should Extend Upcoming Deadlines

UCC has submitted requests to extend the compliance deadline of July 15, 2026 by one year for four projects that are being implemented to comply with the ethylene oxide provisions

of the HON rule. We are continuing to work with EPA on their request for more information related to these extension requests.

In preparing to comply with the HON rule, UCC has undertaken an extensive amount of work to sample and test individual process vents and process wastewater streams to determine if these sources meet the definition of "In Ethylene Oxide Service". UCC has also expended significant financial resources on project scoping and engineering for all of the projects, and devoting significant employee time, including new hires and reallocation of human capital away from other workstreams. Beginning in April 2024, UCC commenced comprehensive sampling and monitoring at two of its facilities to identify which projects would need upgrades to comply with the HON rule and which projects are "in ethylene oxide service" (meaning that the projects include equipment that processes ethylene oxide ("EO")). Because of the sheer number of product lines and the vastness of UCC equipment that is involved in EO-related processes, those efforts remain ongoing. The breadth of projects that UCC must implement to comply with the final rule is constantly evolving, as UCC has been forced to add and subtract projects as new sampling information becomes available.

UCC is required to undertake an extensive assessment process to determine whether equipment is in EO service, and how UCC can and should upgrade its equipment to meet the HON rule's extraordinarily stringent limits. That process requires (1) testing vents for flow rate and composition; (2) scoping out potential solutions to bring EO emissions into compliance with the final rule; and (3) sourcing bids from external vendors who may be able to develop the required technology. Each of these steps presents significant practical challenges. For example, there are few vendors who are qualified to build the necessary devices and, because every EO emitting industry needs to comply simultaneously, industry faces a significant backlog. Similarly, some of the technologies needed to comply with EPA's requirements have known reliability issues.

Without an extension, UCC will not be able to meet the compliance timeline and potentially will have to shut down some of its facilities until we complete these projects. UCC will also be forced to implement projects at a rate that increases safety risks; diverts resources from other previously planned projects; and limits UCC's ability to innovate and develop new products to help the American people in everyday life. An extension is therefore needed ***now*** to avoid expending significant resources to comply with the final rule's unreasonable deadlines.

EPA Should Grant the Motion for Reconsideration

EO serves as an important chemical precursor used to produce a wide range of other chemicals, including home and personal care products, pharmaceuticals, agricultural products, antifreeze, military jet fuels, plastics, detergents, and textiles. It also performs a crucial role as a sterilizing agent for heat-sensitive medical equipment that cannot be sterilized with steam or radiation.

UCC may have to shut down some facilities that produce or use ethylene oxide in the second half of 2026 to comply with the HON rule, which is likely to have downstream impacts on the derivatives of EO with consequences for all of the sectors mentioned above.

Despite the critical role EO plays in everyday life, EPA refused to incorporate several of industry's comments into the HON rule. Nor has it adequately addressed the objections that EPA has exceeded its authority and imposed burdensome regulations that do not reflect the best and most appropriate reading of the statutory requirements. The rule imposes significant costs that are not outweighed by the expected public benefits, and it will harm national interests. As a result, EPA should grant the petition for reconsideration and take time to impose a HON rule that is appropriate, cost-effective, and consistent with the national interest.

Respectfully submitted,

Andrew J. Switalski
Vice President, General Counsel and Secretary

Saint Paul, Minnesota 55104; *and*

NATURAL RESOURCES DEFENSE COUNCIL, INC.
40 West 20th Street, 11th Floor,
New York, New York 10011;

Plaintiffs,

v.

DONALD TRUMP, President of the United States, in his official capacity;

U.S. ENVIRONMENTAL PROTECTION AGENCY; *and*

LEE ZELDIN, Administrator of the U.S. Environmental Protection Agency, in his official capacity;

Defendants.

Case No. 1:26-cv-287

COMPLAINT FOR DECLARATORY AND INJUNCTIVE RELIEF

1. On July 17, 2025, President Donald Trump seized on a narrow and, until last year, never-before-used provision of the Clean Air Act, 42 U.S.C. § 7412(i)(4), to exempt the entirety of the taconite iron ore processing industry for two years from the 2024 updates to the National Emission Standards for Hazardous Air Pollutants ("NESHAP") for the Taconite Iron Ore Processing source category (known as the "2024 Taconite Rule"). Proclamation No. 10958,

ED_021114_00001748-00001

Regulatory Relief for Certain Stationary Sources to Promote American Iron Ore Processing Security, 90 Fed. Reg. 34,743 (July 17, 2025) ("Taconite Proclamation" or "Proclamation"). Taconite processing emits mercury – a known neurotoxin linked to IQ loss, deficiencies in attention-span, motor function, language, and visual spatial ability that is especially of concern for developing fetuses and young children – among other toxic air pollutants. After nearly 20 years of regulatory delay, the 2024 Taconite Rule established the first and only federally enforceable mercury emission standard for the taconite source category.

2. Besides establishing mercury standards, the 2024 Taconite Rule revised the standards for hydrogen chloride and hydrogen fluoride ("acid gas") by directly regulating them rather than using particulate matter ("PM") emissions limits as a surrogate. EPA estimated that these more stringent emissions standards will reduce combined acid gas emissions by 719 tons per year (hydrogen chloride and hydrogen fluoride emissions by 683 tons per year and 36 tons per year, respectively) and mercury emissions by 247 pounds per year. *National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing*, 89 Fed. Reg. 16,420 (Mar. 6, 2024). EPA determined the 2024 Taconite Rule will reduce the risk or incidence of premature death, aggravated asthma, and non-fatal heart attacks. *Id.* at 16,421.

3. EPA issued the 2024 Taconite Rule in part to comply with the D.C. Circuit's decision in *Louisiana Environmental Action Network v. EPA*, 955 F.3d. 1088 (D.C. Cir. 2020) ("*LEAN*"), which held that EPA must set emission standards for all unregulated hazardous air pollutants ("HAPs") emitted by a major source category when conducting its required 8-year technology review under Section 7412(d)(6) of the Clean Air Act. EPA's "gap filling" in the 2024 Taconite Rule established for the first time—as required under the *LEAN* Court's mandate—

standards for mercury emissions from the Taconite Iron Ore Processing source category. *See* 89 Fed. Reg. at 16,409.

4. There are seven active and one indefinitely idled taconite iron ore processing facilities in the United States, located in Minnesota and Michigan as illustrated in Figure 1, below. President Trump's Taconite Proclamation exempts all of them, effectively suspending the 2024 Taconite Rule for two years and, putting communities at risk from toxic air pollutants emitted by taconite facilities. The eight facilities are owned by just two parent companies: U.S. Steel and Cleveland-Cliffs. The cost of compliance with the 2024 Taconite Rule is less than 1 percent of the annual sales revenue per ultimate owner. 89 Fed. Reg. 16,421. By granting these exemptions, President Trump has given a free pass to the industry to continue delaying controls at the expense of environmental protection and public health: due to these exemptions, facilities may continue to emit mercury in whatever amounts result from their operations with no federally enforceable emissions limit.

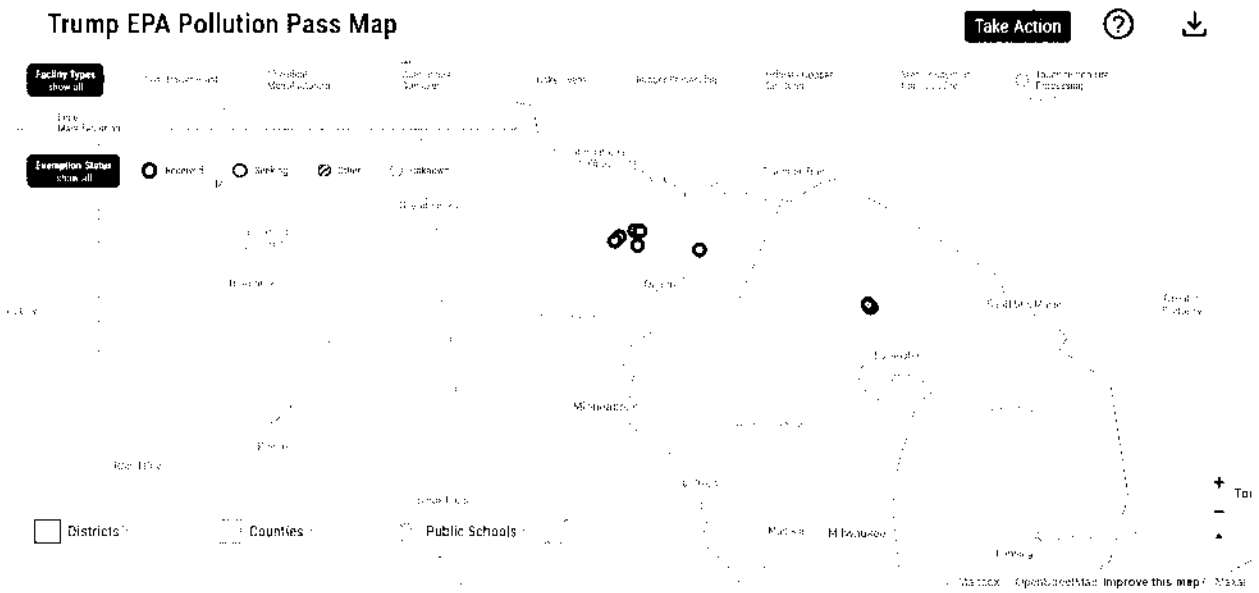

Image from https://www.edf.org/maps/epa-pollution-pass/ (last accessed Jan. 12, 2026)

5. The never-before-used provision of the Clean Air Act invoked in the Taconite Proclamation allows the President to exempt a source from a hazardous air pollutant standard for up to two years only if "the technology to implement" the relevant standard is "not available" *and* if exempting the source "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4). Both predicates are not met here.

6. In the fifty-five years since Congress enacted Section 7412(i)(4), no President had ever used that exemption authority. In just the first year of his second term, President Trump has done so seven times for more than 180 facilities. Besides the Taconite Proclamation that exempted the entire taconite iron ore processing industry from mercury standards, President Trump issued proclamations exempting nearly one-third of U.S. coal-fired power plants from mercury and other air toxics standards, nearly half of commercial sterilizers from ethylene oxide standards, 50 chemical manufacturers from ethylene oxide and other hazardous air pollutant standards, one of two primary copper smelters from mercury and other HAP standards, and all eleven coke oven facilities from applicable hazardous air pollutant standards.

7. President Trump's far-reaching Taconite Proclamation grossly exceeds the bounds of the Section 7412(i)(4) exemption authority. The Proclamation exempts all operating facilities regulated by the 2024 Taconite Rule from complying with any part of the Rule without any standard or facility-specific analysis to show that any (let alone all) of the eight exempted facilities meet the statutory standard. The air pollution control technology needed to comply with the acid gas standards already exists at the majority of operating facilities and effectively controls both acid gas and mercury pollution. The technology needed to comply with the mercury standards has been piloted by taconite facilities and has been used for many years to effectively reduce mercury emissions from plants in other industries. That the control technology

for mercury has not previously been required for taconite ore processing due to the lack of federally enforceable emission standards—and thus that the technology has not been installed at those facilities does not mean the technology to implement it is "not available."

8. The scope, content, and context of the Taconite Proclamation show it for what it really is: a pretext to relieve polluters from working to comply with the 2024 Taconite Rule while EPA works administratively to repeal those critical protections. Congress explicitly prohibited the agency from staying the effective date of such a rule, during reconsideration, by more than three months. *See* 42 U.S.C. § 7607(d)(7)(B).

9. The Taconite Proclamation violates the Clean Air Act and exceeds the President's lawful authority. Plaintiffs ask the Court to enter appropriate relief declaring the Proclamation unlawful and invalid and enjoining EPA and its Administrator from implementing or giving effect to it.

JURISDICTION AND VENUE

10. This Court has subject matter jurisdiction under 28 U.S.C. § 1331 because this is a civil action arising under laws of the United States, including the Clean Air Act.

11. Venue is proper in this Court under 28 U.S.C. § 1391(e) because Defendants reside in this judicial district, and because a substantial part of the events giving rise to the claim occurred in this judicial district.

12. The Court has authority to enter a declaratory judgment and to provide injunctive relief pursuant to Rules 57 and 65 of the Federal Rules of Civil Procedure; the Declaratory Judgment Act, 28 U.S.C. §§ 2201-2202; the All-Writs Act, 28 U.S.C. § 1651; and the Court's inherent equitable powers.

PARTIES

The Plaintiffs

13. Plaintiff Minnesota Center for Environmental Advocacy ("MCEA") is a Minnesota 501(c)(3) nonprofit organization with members residing across Minnesota and has offices in St. Paul and Duluth. MCEA's mission is to use law and science to protect Minnesota's environment, its natural resources, and the health of its people. MCEA has worked to reduce pollution from the taconite industry and improve water quality for more than fifty years as a means of protecting Minnesota communities, particularly those that are disparately impacted by mercury emissions, such as Indigenous communities and those residing, working, and recreating in Northeastern Minnesota. It has done so across multiple program areas, including Healthy Communities, Northeastern Minnesota, and its Water program. MCEA was established in 1974 and is located at 1919 University Ave. W., Suite 515, St. Paul, Minnesota 55104. MCEA has members that live, work, and recreate near facilities that received exemptions and the Taconite Proclamation will directly harm these members by depriving them of the protections afforded by the Taconite Rule.

14. Plaintiff Natural Resources Defense Council, Inc. ("NRDC") is a national 501(c)(3) nonprofit environmental membership organization with hundreds of thousands of members nationwide. NRDC's purpose is to safeguard the Earth—its people, its plants and animals, and the natural systems on which all life depends. Part of NRDC's core mission is to improve air quality and safeguard public health by combating hazardous air pollutant emissions. NRDC has members that live, work, and recreate near facilities that received exemptions and the Taconite Proclamation will directly harm these members by depriving them of the protections afforded by the Taconite Rule.

15. Plaintiffs' members live, work, and recreate in areas affected by the excess pollution that is and will be emitted from the exempted facilities. They are harmed by breathing air pollution from the exempted facilities and are concerned that exposure to hazardous air pollutants from the exempted facilities could have harmful effects on their health.

16. Plaintiffs' members stood to benefit from the mercury and acid gas standards in the 2024 Taconite Rule, which existing facilities were required to comply with by March 8, 2027, the latest allowable timeframe in Section 7412(i)(3) of three years after the effective date of the Rule. Exempted facilities are now not required to comply with the emission controls in the 2024 Taconite Rule and will be able to emit toxic air pollution at higher levels than otherwise would be allowed. Plaintiffs and Plaintiffs' members are harmed by the excess emissions that will result from the Taconite Proclamation exemptions.

17. Exposure to mercury, acid gases, and other hazardous air pollutants emitted by exempted facilities causes adverse health effects. These exemptions increase the likelihood of hazardous pollutant exposure and related harms in the communities surrounding the exempted facilities.

18. Craig Beveroth is a member of MCEA. He owns a cabin on Lake Vermillion in Tower, Minnesota, less than 30 miles from the U.S. Steel Corp Minntac facility. His cabin is a year-round residential home, and Mr. Beveroth resides in this cabin every other week in the summer and approximately once per month in the winter. When he travels to his cabin, Mr. Beveroth shops at one of several grocery stores in the area proximate to his cabin including the Walmart located one mile from the Minntac facility. Mr. Beveroth is concerned about mercury contamination and sulfation and the impacts of that pollution on Lake Vermillion. Due to these concerns about mercury contamination, he eats less fish from the area.

19. Robin Raplinger is a member of NRDC. He lives in Virginia, Minnesota within three miles of the ArcelorMittal/Cleveland-Cliffs Minorca facility and five miles of the U.S. Steel Corp Minntac facility. He has had a stroke in the past and is concerned that his health conditions will be exacerbated by living in an area that is in such proximity to the processing facilities. Mr. Raplinger spends significant time outdoors engaging in recreational activities including mountain biking, snowshoeing, and skiing on trails that are within one mile of the Minorca facility, and is concerned about the air pollution from the facilities getting into his own lungs during these outdoor activities. He also fishes in the Boundary Water Canoe Area Wilderness and is aware of advisories that warn against eating too many fish due to mercury accumulation in the fish. Although he recreationally fishes, he rarely eats the fish he catches due to concerns about mercury accumulation. He has taken measures including installing a reverse osmosis filtration system in his home because he is concerned about the negative health impacts of hazardous air pollutants from the taconite ore processing facilities. As a result of the Taconite Proclamation, Mr. Raplinger is concerned that the Minorca and Minntac facilities will emit more hazardous air pollutants during the two-year exemption period.

20. Plaintiffs and their members are therefore harmed by the Taconite Proclamation exemptions.

The Defendants

21. Defendant Donald Trump is the President of the United States. He resides and conducts his duties in Washington, D.C. He is sued in his official capacity.

22. Defendant U.S. Environmental Protection Agency ("EPA") is a federal agency of the United States. Its mission is to protect human health and the environment, and

responsibilities include issuing and enforcing hazardous air pollutant standards, including the Taconite Rule at issue here. EPA is headquartered in Washington, D.C.

23. Defendant Lee Zeldin is the Administrator of the U.S. Environmental Protection Agency. He resides and conducts his duties in Washington, D.C. He is sued in his official capacity.

LEGAL BACKGROUND

The Clean Air Act's Program to Address Hazardous Air Pollution

24. Clean Air Act Section 7412, 42 U.S.C. § 7412, establishes the framework for EPA's regulation of "hazardous air pollutants" from stationary sources, including industrial facilities.

25. "Hazardous air pollutants" for Section 7412 purposes are a group of 188 air pollutants determined by Congress and EPA to be particularly harmful to human health. Mercury and acid gases are hazardous air pollutants. Section 7412 requires EPA to regulate hazardous air pollutants by issuing emissions standards for categories and subcategories of stationary sources of such pollutants. Emissions standards must require the maximum degree of reduction that EPA deems "achievable," taking into consideration cost and any non-air quality health and environmental impacts and energy requirements. *Id.* § 7412(d)(2).

26. After EPA establishes Section 7412 standards for a source category, the Clean Air Act requires EPA to perform recurring reviews to ensure that the standards adequately address risks to health and welfare from hazardous air emissions and that they reflect advancements in technology and practice that allow sources to achieve even greater emission reductions. These reviews are often done together and are known as the "residual risk and technology review."

27. In a technology review, EPA must "review, and revise" the Section 7412 standards "as necessary (taking into account developments in practices, processes, and control technologies)." *Id.* § 7412(d)(6).

28. In a risk review, EPA determines whether unacceptable risk to public health remains, or is likely to remain, from hazardous air pollutant emissions even after the application of Section 7412 standards. If unacceptable risk remains, EPA must promulgate additional standards that eliminate the unacceptable risk, "provide an ample margin of safety to protect public health," and prevent "an adverse environmental effect." *Id.* § 7412(f)(2)(A).

29. Congress also prescribed strict compliance schedules for Section 7412 standards. Residual risk-based emissions standards "shall become effective upon promulgation" for new sources, or 90 days after the effective date for existing sources. *Id.* §§ 7412(f)(3), (4). EPA may waive compliance for up to two years only if it determines "such period is necessary for the installation of controls and that steps will be taken during the period of the waiver to assure that the health of persons will be protected from imminent endangerment." *Id.* § 7412(f)(4)(B).

30. For standards revised as the result of a technology review, EPA must require existing sources to comply "as expeditiously as practicable," and generally no later than three years after the effective date. *Id.* § 7412(i)(3)(A). EPA may grant a source up to one additional year to comply only where "such additional period is necessary for the installation of controls." *Id.* § 7412(i)(3)(B).

Clean Air Act Procedural Requirements

31. The Clean Air Act sets out rulemaking requirements that apply to "the promulgation or revision of any . . . emission standard or limitation under Section 7412(d)." *Id.* § 7607(d)(1)(C). EPA must establish a rulemaking docket, publish a notice of proposed

rulemaking in the Federal Register, and provide a statement of basis and purpose for the rule that includes the factual data on which the proposed rule is based, the methodology used in obtaining and analyzing the data, and the major legal interpretations and policy considerations underlying the proposed rule. *Id.* § 7607(d)(3). EPA must also provide, along with the proposal, any comments by the Scientific Review Committee and the National Academy of Sciences and data, information, and documents on which the proposed rule relies. *Id.*

32. The Clean Air Act also requires EPA to allow any person to submit written comment, and to provide an opportunity for oral presentation of data, views, or arguments, on a proposed rule. *Id.* § 7607(d)(5); *see also id.* § 7607(h). In promulgating a final rule, EPA must provide a statement of basis and purpose as required at the proposal stage and must explain major changes from the proposed to final rule. *Id.* § 7607(d)(6)(A). EPA must also provide a response to each of the significant comments, criticisms, and new data submitted during the comment period. *Id.* § 7607(d)(6)(B). EPA may not base a promulgated rule on "any information or data which has not been placed in the docket as of the date of such promulgation." *Id.* § 7607(d)(6)(C).

33. The Clean Air Act also provides procedures for reconsidering a promulgated rule. The EPA Administrator can "convene a proceeding for reconsideration of the rule" but must "provide the same procedural rights as would have been afforded" in the original proceeding. *Id.* § 7607(d)(7)(B). The Clean Air Act states, however, that reconsideration "shall not postpone the effectiveness of the rule," except that the Administrator or a reviewing court may stay the effectiveness of the rule "for a period not to exceed three months." *Id.* Section 7607(d)(7)(B) is the sole authority EPA has to stay a rule after its effective date has passed. *See Clean Air Council v. Pruitt*, 862 F.3d 1, 9 (D.C. Cir. 2017).

ED_021114_00001748-00011

Presidential Exemption Provision

34. Section 7412(i)(4) of the Clean Air Act authorizes the President, in narrowly prescribed circumstances, to "exempt any stationary source from compliance" with hazardous air pollutant standards promulgated under Section 7412, "for a period of not more than 2 years if the President determines [1] that the technology to implement such standard is not available and [2] that it is in the national security interests of the United States to do so." 42 U.S.C. § 7412(i)(4).

35. The President may extend the original exemption "for 1 or more additional periods, each period not to exceed 2 years." *Id.*

FACTUAL AND PROCEDURAL BACKGROUND

Taconite Iron Ore Processing Industry NESHAP

36. In 2003, EPA promulgated the first hazardous air pollutant standards for taconite iron ore processing facilities at 40 C.F.R. part 63, subpart RRRRR. National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing, 68 Fed. Reg. 61,868 (Oct. 30, 2003) ("2003 Taconite Rule"). EPA completed a residual risk and technology review for the Taconite Rule in 2020. National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Residual Risk and Technology Review, 85 Fed. Reg. 45,476 (July 28, 2020) ("2020 Taconite Rule").

37. The taconite iron ore processing facility source category comprises any facility engaged in the separation and concentration of iron ore from taconite to produce taconite pellets, including taconite ore crushing and handling operations, indurating furnaces, finished pellet handling operations, and ore dryers. *Id.* at 45,478. The taconite pellets produced by this source category serve as raw materials for the manufacture and production of steel. U.S. EPA, *Economic Impact Analysis for the Final National Emission Standards for Hazardous Air Pollutants:*

Taconite Iron Ore Processing Amendments, No. EPA-HQ-OAR-2017-0664-0309, at 1-1 (Jan. 2024). Currently, the U.S. has eight total taconite ore processing facilities, located in Minnesota and Michigan. One of these facilities, the Empire Mine in Ishpeming, Michigan, is idled and has no plans to resume operations. *Id.* at 3-2. The six operating taconite plants in Minnesota account for approximately half of the state's mercury emissions.

38. Emissions from taconite iron ore processing facilities are a major driver of adverse health effects.

39. Mercury is an environmentally persistent neurotoxin that bioaccumulates in humans and leads to especially troublesome health effects in developing fetuses and young children. 89 Fed. Reg. at 16,415, 16,421. Indigenous communities around the Great Lakes are particularly impacted by mercury exposure from taconite iron ore processing facilities because fish are an important subsistence resource for these communities. *Id.* at 16,414-16,415.

40. Acid gases such as hydrochloric acid and hydrofluoric acid cause irritation and inflammation of the respiratory tract, heart attacks, asthma, and even premature death. *Id.* at 16,421; *see also* U.S. EPA, *Fact Sheet: Final Amendments to Air Toxics Standards for Taconite Iron Ore Processing*, https://perma.cc/WA9S-KS73.

The 2003 Taconite Rule

41. In the 2003 Taconite Iron Ore Processing NESHAP, EPA promulgated the first maximum achievable control technology ("MACT") standards for the taconite source category under Section 7412(d). 68 Fed. Reg. 61,868. Because this was the initial regulation of HAPs from taconite processing, EPA's task was limited to establishing the MACT floor for new and existing major sources using the statutory formula set forth in Section 7412(d)(2)-(3), rather than conducting any risk review under Section 7412(f). *See id.* at 61,869.

42. EPA identified the relevant affected emission points – ore crushing and handling, ore dryers, indurating furnaces, and finished pellet handling operations – and determined that these units collectively represent the predominant sources of HAP emissions in the source category. *Id.* at 61,869.

43. The 2003 Taconite Rule included a descriptive summary of the health effects associated with taconite HAPs, including mercury, noting chronic and acute adverse effects on blood, the heart, kidneys, and the reproductive, respiratory, and central nervous systems. It further recognized that some of the HAPs emitted by this source category are carcinogens. *Id.* at 61,868.

44. Although the 2003 Taconite Rule recognized mercury as a listed metal HAP emitted by taconite iron ore processing facilities, it did not set any emission standards for mercury. *Id.* at 61,869.

The 2020 Taconite Rule

45. In 2020, EPA completed its required residual risk review under Clean Air Act Section 7412(f)(2) and technology review under Section 7412(d)(6) for the taconite source category. 85 Fed. Reg. at 45,479. It made no revisions to the numerical emissions limits of the 2003 Taconite Rule, only amendments to monitoring, compliance, and implementation. *Id.*

46. At the time EPA conducted the 2020 risk and technology review, it found that risks due to emissions of air toxics from this source category, not including mercury, were acceptable and that the existing emission standards provided an ample margin of safety to protect public health and prevent adverse environmental effects. *Id.* at 45,484; *see also* U.S. EPA, *Residual Risk Assessment for the Taconite Iron Ore Processing Source Category in Support of*

the 2019 Risk and Technology Review Proposed Rule, No. EPA HQ OAR 2017 0664 0130 (Aug. 1, 2019).

47. It determined that no revision of the 2003 MACT standards was warranted and therefore continued to rely on the existing 2003 standards which used PM as a surrogate for metal HAP emissions. 85 Fed. Reg. at 45,476, 45,479.

48. EPA explained that Section 7412(f)(2) requires it to determine whether the existing MACT standards established in 2003 provide an "ample margin of safety" to protect public health and whether additional standards are necessary to prevent adverse environmental effects. *Id.* at 45,478. It went on to explain that it was required under Section 7412(d)(6) to review technological developments and revise MACT standards "as necessary," but that it read this as a "limited provision" that did not "direc[t]" the Agency to "develop new emission standards to address HAP . . .for which standards were not previously promulgated." *Id.* at 45,485. Notably, it acknowledged that "as [it] was preparing the final rule for signature, a decision was issued in *[LEAN]* in which the Court held that the EPA has an obligation to set standards for unregulated pollutants as part of technology reviews under CAA section 112(d)(6)" but that "[a]t the time of signature, the mandate in [*LEAN*] had not been issued and the EPA is continuing to evaluate the decision." *Id.* at 45,485 n.2.

49. Accordingly, EPA did not comply with the *LEAN* mandate at the time of the 2020 risk and technology review. That compliance would not come until the 2024 Taconite Rule, when the Agency would address the regulatory gap and establish new standards for mercury emissions.

The 2024 Taconite Rule

50. In the 2024 Taconite Rule, EPA promulgated revised NESHAP amendments for the taconite iron ore processing source category to close previously identified regulatory gaps

and to satisfy Clean Air Act residual risk and technology review obligations. 89 Fed. Reg. at 16,409.

51. EPA discussed the health effects of mercury and acid gases, explaining that mercury is a persistent, bioaccumulative neurotoxin that poses particular risks to developing fetuses, children, and subsistence fishers like Tribal communities. *Id.* at 16,413-15. It acknowledged record evidence linking mercury deposition in the Upper Great Lakes Region to fish consumption advisories and adverse impacts on wildlife and human health. *Id.*

52. Similarly, it explained that the rule would limit emissions of directly emitted particulate matter which would reduce non-fatal heart attacks, cases of aggravated asthma, and other adverse health effects. *Id.* at 16,421.

53. The revisions EPA made were demanded by updated emissions data revealing that mercury, an unregulated HAP under the previous taconite rules, was being emitted from taconite iron ore processors. *Id.* at 16,409-10.

54. The new emissions data prompting the review were acquired through a 2022 information collection request under Section 7414 of the Clean Air Act. *Id.* at 16,410; *see also id.* at 16,417 (citing David Putney, U.S. EPA, *Final Emissions Data Collected in 2022 for Indurating Furnaces Located at Taconite Iron Ore Processing Plants*, No. EPA-HQ-OAR-2017-0664-0301 (Sept. 2023)). In that information request, EPA gathered stack testing data on PM and acid gas emissions from indurating furnaces at all taconite facilities. It produced exhaust stack testing and a dataset much more robust and representative of current conditions, revealing that the indurating furnaces emit mercury. *Id.* at 16,417.

55. The D.C. Circuit held in *LEAN* that EPA has an obligation to address regulatory gaps, such as missing standards for HAPs known to be emitted from a major source category,

when it conducts the eight-year technology review required by Section 7412(d)(6) of the Clean Air Act. 955 F.3d. at 1098-99.

56. Consistent with *LEAN*, the Agency was obligated to establish standards for mercury emissions under the taconite iron ore processing NESHAP because mercury emissions were not regulated under the existing NESHAP. 89 Fed. Reg. at 16,409 (citing *LEAN*, 955 F.3d 1088).

57. For mercury, EPA conducted a technology-based review as mandated in Section 7412(d)(2)-(3) to establish a MACT standard for the mercury emitted from taconite indurating furnaces. *Id.* at 16,409.

58. In establishing the MACT floor for existing sources, EPA identified the five best-performing existing units with respect to each pollutant and used their emissions performance as the basis, consistent with Section 7412(d)(3). *Id.* at 16,414. EPA identified the five best-performing indurating furnaces based on stack test data received and calculated the MACT floor using a 99-percent upper prediction limit reflecting emissions achieved in practice by those units. *Id.* at 16,410-11. This method ensured that the floor reflects achievable performance while accounting for operational variability. *See id.* at 16,419. EPA finalized mercury emission limits of 1.4×10^{-5} pounds of mercury emitted per long ton of taconite pellets produced for existing sources. *Id.* at 16,415.

59. For new sources, EPA set the MACT standard equal to the emissions level achieved in practice by the single best-controlled similar source. *Id.* at 16,414. EPA finalized mercury emission limits of 2.6×10^{-6} pounds of mercury emitted per long ton of taconite pellets produced for new sources, with an emissions-averaging compliance option for facilities with multiple furnaces. *Id.* at 16,415. This would reduce mercury emissions from taconite facilities by

about 247 pounds per year, which EPA expects to result in corresponding reductions in mercury deposition and improved public health outcomes. *Id.* at 16,420-21.

60. EPA explained that, in setting the MACT floor, it may not consider cost, energy impacts, or economic feasibility because Section 7412(d)(2)-(3) requires the MACT floor to be based solely on emissions performance actually achieved in practice. *Id.* at 16,414.

61. EPA found activated carbon injection systems to be an accessible control technology for complying with the new mercury standards. David Putney, U.S. EPA, *Development of Impacts for the Final Amendments to the NESHAP for Taconite Iron Ore Processing*, No. EPA-HQ-OAR-2017-0664-0307, at 6-7 (Jan. 29, 2024) ("Impacts of 2024 Rule Analysis"). An activated carbon injection system is an add-on air pollution control system that injects activated carbon or brominated activated carbon into the flue gas steam upstream of a particulate matter control device.The activated carbon absorbs mercury, and this mercury-laden carbon is then collected in the particulate matter control device. 89 Fed. Reg. at 16,437-38.

62. The Agency also separately evaluated a range of add-on control technologies to determine whether standards more stringent than the MACT floor (beyond-the-floor standards) were warranted for mercury, but it ultimately declined to adopt beyond-the-floor mercury standards and finalized the mercury standards at the MACT floor. *Id.* at 16,415.

63. EPA also set revised standards for acid gases following a technology review. *Id.* at 16,409. The Agency relied on the updated emissions data from the 2022 information request and corrected data errors identified through public comments from industry to derive revised MACT standards. *Id.* at 16,416-17. It explained that existing PM-based surrogate standards no longer accurately reflect current emissions performance or technological developments. *Id.* at 16,417.

64. EPA recalculated the MACT floor for acid gases using corrected data and finalized numerical limits that reflect emissions achieved by the best-performing existing units. *Id.* at 16,416.

65. The Agency found wet scrubbers and dry sorbent injection to be feasible control technologies to meet the revised acid gas standards. *Id.* at 16,417. A wet scrubber is an air pollution control device that removes PM and acid gases from a coal gas stream by introducing a liquid solution which dissolves the pollutants and is collected for disposal. U.S. EPA, *Control Cost Manual*, § 5, ch. 1, at 1-3 (Apr. 2021), https://perma.cc/6G6T-PYXF. A venturi scrubber[1] is a type of wet scrubber that cleans exhaust air by forcing it through a set of narrow parallel metal pipes, called venturi throats, where an injected liquid forms droplets that capture the pollutants. *Id.* at 1-5; 68 Fed. Reg. at 61,902. Dry sorbent injection systems inject an alkaline sorbent into the flue gas stream, where the sorbent reacts with acid gases to produce salts that are collected by a downstream particulate control device. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 11 (Jan. 29, 2024).

66. A number of groups submitted public comment on the proposed rule. 89 Fed. Reg. at 16,410-19. In response to industry concerns about the proposed mercury MACT standards, EPA responded that it had incorporated the revised emissions data of several facilities shared by industry commenters and "recalculated the baseline emissions, MACT floor emission limits, emission reductions, and estimated capital and annual costs . . . for the final rule." *Id.* at 16,410. EPA further appropriately adjusted the estimated capital and operating costs for mercury controls

[1] In the final 2024 NESHAP, EPA identifies wet scrubbers as a feasible control technology to limit acid gas emissions. 89 Fed. Reg. at 16,417. The specific type of wet scrubber that EPA discusses in its technical memoranda as an accessible control option is called a "wet venturi scrubber." Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 8-9 (Jan. 29, 2024).

based on industry commenters' provided information that costs were underestimated in the proposed rule. *Id.* at 16,411.

67. EPA determined that the controls required by the 2024 Taconite Rule are feasible and reasonably achievable. It considered developments in practices, processes, and control technologies as well as the costs of compliance and determined that the facilities could achieve these standards in a manner that did not impose a significant financial burden on industry. *Id.* at 16,412, 16,414, 16,417. It further explained that six of the seven operational facilities would not need to install additional controls to comply with the revised MACT standards for acid gases and two of the seven would not need to install additional controls to comply with the MACT standard for mercury. *Id.* at 16,420, 16,423.

68. EPA set March 8, 2027, as the deadline for all existing taconite facilities to comply with the requirements of the 2024 Taconite Rule. *Id.* at 16,425.

EPA Announces Reconsideration, Solicits Exemption Requests

69. Industry groups complained about the 2024 Taconite Rule to the EPA Administrator in a letter dated June 14, 2024, where they stated that the final rule was one of a set of rules that would "undermine. . . national security." Pet'rs' Mot. Stay at 69, *Cleveland-Cliffs Inc. v. U.S. EPA*, Case No. 0:2024rev01211 (D.C. Cir. June 26, 2024), Doc. #2061787). Weeks later, the owners of the facilities subject to the 2024 Taconite Rule moved for a stay of the 2024 Taconite Rule. *Id.* at 8. They contended, among other arguments, that "there are no gaps to fill where EPA made an affirmative determination not to regulate" mercury, *id.* at 9, attempting to evade the *LEAN* court's unequivocal mandate. The D.C. Circuit denied the motion for stay, finding that industry groups had failed to make a "strong showing" that they were likely to succeed in arguments that EPA "was not required to regulate mercury emissions from taconite

iron ore processing facilities or that it should have considered costs in setting a floor standard." Order Den. Pet'rs' Mot. to Stay at 2, *Cleveland-Cliffs Inc. v. U.S. E.P.A.*, Case No. 0:2024rev01211, Doc. #2078098 (D.C. Cir.), filed Oct. 3, 2024. The Court went on to hold that the industry groups had also failed to demonstrate that their compliance costs were "certain and great" during the time it would take for the Court to resolve the petitions for review. *Id.* at 3.

70. On March 12, 2025, in a press event billed as "the greatest day of deregulation our nation has seen," EPA announced that it would "reconsider" the 2024 Taconite NESHAP and dozens of other regulations protecting human health and the environment. U.S. EPA, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://perma.cc/EXL5-FAMQ.

71. Along with its press release, EPA published a "fact sheet" about its planned reconsideration of the 2024 Taconite Rule and seven other recent hazardous air pollutant rules. That fact sheet included an invitation that "[a]ny source interested in a Presidential exemption," from any of the eight rules "should provide their recommendations to EPA by March 31, 2025." U.S. EPA, *National Emission Standards for Hazardous Air Pollutants (NESHAP): Powering the Great American Comeback Fact Sheet* 3, https://perma.cc/E8UM-RN3K. It further explained, "Sources need only provide why technology is unavailable and why it is in the national security interests of the United States to provide the exemption." *Id.*

72. Following up on its invitation to request exemptions, on or about March 24, 2025, EPA posted a new webpage announcing it had established "an electronic mailbox to allow the regulated community to request a Presidential Exemption under section 112(i)(4)." U.S. EPA, *Clean Air Act Section 112 Presidential Exemption Information* (last updated Apr. 14, 2025),

ED_021114_00001748-00021

https://perma.cc/WKL5-44FC. EPA asked that requests be submitted by March 31, 2025, a week after the webpage was posted.[2]

73. EPA did not solicit any information from the public or provide any opportunity for public comment.

74. Facility owners sent exemption requests to that email inbox. In a 9-page letter, Cleveland-Cliffs explained that it needed relief from the 2024 Taconite Rule because of the cost to evaluate compliance with the Rule. And in its own 14-page letter, the owner of the remaining processing facilities, U.S. Steel, requested an exemption because the Rule would require immediate actions that would unfairly burden it.

The Taconite Proclamation

75. On July 17, 2025, President Trump issued a proclamation that exempted "certain stationary sources . . . as identified in Annex I of this proclamation" from the 2024 Taconite Rule "for a period of 2 years beyond the Taconite Rule's relevant compliance dates." Regulatory Relief for Certain Stationary Sources to Promote American Iron Ore Processing Security, 90 Fed. Reg. at 34,743. Every facility subject to the Taconite NESHAP was included in Annex I.

76. The Taconite Proclamation cited "authority vested in [the President] by the Constitution and the laws of the United States, including section 112(i)(4) of the Clean Air Act, 42 U.S.C. 7412(i)(4)." *Id.* It stated that it "applies to all compliance deadlines established under the Taconite Rule, with each such deadline extended by 2 years from the date originally required for such deadline." *Id.*

[2] EPA removed much of the information it initially posted in an April 14, 2025 update to the webpage. *See* U.S. EPA, *Clean Air Act Section 112 Presidential Exemption Information* (last updated Apr. 14, 2025), https://perma.cc/WKL5-44FC.

77. The Taconite Proclamation included what it referred to as two "determinations." *Id.* at 34,743-44.

78. First, the Taconite Proclamation purported to determine that "[t]he technology to implement the Taconite Rule is not available," stating that "[s]uch technology does not exist in a commercially viable form sufficient to allow implementation of and compliance with the Taconite Rule by the compliance dates in the Taconite Rule." *Id.*

79. Second, the Taconite Proclamation purported to determine that "[i]t is in the national security interests of the United States to issue this Exemption for the reasons stated in paragraphs 1 and 3 of this proclamation." *Id.* at 34,744. Paragraph 1 asserted that "[t]aconite iron ore processing is fundamental to the United States' steel production and manufacturing sectors," and "[p]reserving and enhancing domestic taconite processing capabilities is vital to reducing reliance on foreign sources and ensuring resilience of American industrial supply chains." *Id.* at 34,743. Paragraph 3 asserted that "[t]he Taconite Rule places significant burdens on a sector [the steel industry] critical to the Nation's industrial foundation," and provides a compliance timeline that "risks forcing shutdowns, reducing domestic production, and undermining the Nation's ability to supply steel for defense, energy, and critical manufacturing." *Id.*

80. The Taconite Proclamation and "Annex I" were published in the Federal Register on July 23, 2025. *Id.*

81. The Taconite Proclamation included no facility-, standard-, or technology-specific determinations. Instead, the Taconite Proclamation broadly and conclusory purported to "determin[e]" that the technology to implement the 2024 Taconite Rule (in its entirety) was not available and that exemptions are in the national security interests of the United States.

82. The Taconite Proclamation indiscriminately exempted an entire industry from compliance with the 2024 Taconite Rule. Indeed, it purports to exempt the Empire Mining facility in Ishpeming, Michigan from the 2024 Taconite Rule a facility which is idle and has no plans to resume operations.

83. The Taconite Proclamation's purported determination regarding technological unavailability is in direct conflict with EPA's findings that the technologies to implement the mercury and acid gas standards imposed by the 2024 Taconite Rule are used by facilities regulated by the 2024 Taconite Rule and other regulated sources.

Technology to Implement the Rule's Requirements is Feasible

84. The Taconite Proclamation's unsupported determinations are unambiguously contradicted by factual evidence on the grounds of technological availability, including EPA's own findings and record for the 2024 Taconite Rule.

85. *Controls for Acid Gas Standards*: Technology to implement the acid gas limits is accessible.

86. EPA reviewed air pollution controls for acid gases and expressly stated that the controls "are available and cost-effective." 89 Fed. Reg. at 16,417.

87. Wet venturi scrubbers are a demonstrated control technology that can be used to comply with the acid gas standard. EPA determined as much in the 2024 Taconite Rule.

88. Wet venturi scrubbers are already being used by the majority of operating taconite plants to meet the preexisting PM standards. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 8 (Jan. 29, 2024). In fact, wet venturi scrubbers have been in use at many operating taconite plants for decades, even before the promulgation of the 2003 Taconite

ED_021114_00001748-00024

NESHAP. 67 Fed. Reg. 77,562, 77,565 (Dec. 18, 2002); 68 Fed. Reg. 61,868, 61,884 (Oct. 30, 2003).

89. Five of the seven operating facilities in this source category already use wet scrubbers to meet preexisting PM limits for the Taconite NESHAP. U.S. EPA. *Economic Impact Analysis for the Final National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments*, at 3-2 (Jan. 2024). At least four of those facilities use wet venturi scrubbers specifically. *Id.* at 3-3; David Putney, U.S. EPA, *Development of Impacts for the Proposed Amendments to the NESHAP for Taconite Iron Ore Processing*, No. EPA-HQ-OAR-2017-0664-0257, at 8 (Mar. 21, 2023). The MACT standard that EPA decided on in the 2024 Taconite Rule reflects existing, demonstrated performance. 89 Fed. Reg. at 16,419.

90. Dry sorbent injection is a demonstrated control technology that can be used to comply with the acid gas standard. EPA determined as much in the 2024 Taconite Rule.

91. In the 2024 Taconite Rule, EPA found that dry sorbent injection systems are low cost and have been used to control acid gas emissions since the late 1980s in industries such as coal-fired utilities, cement plants, pulp and paper mills, and brick kilns. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 11 (Jan. 29, 2024).

92. Compliance with the acid gas standards imposed by the 2024 Taconite Rule will not require significant retrofits or additional controls.

93. EPA estimated that all existing indurating furnaces would be able to comply with the revised hydrogen fluoride limits without add-on control devices. 89 Fed. Reg. at 16,416-17, 16423; *see also* National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments, 88 Fed. Reg. 30,917, 30,927 (May 15, 2023). The agency further estimated that all but two furnaces would be able to comply with the revised hydrogen chloride

limits without additional controls. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 10 (Jan. 29, 2024); *see also* 88 Fed. Reg. at 30,927. For the two furnaces that require additional controls to meet the revised hydrogen chloride standard, EPA found dry sorbent injection, with existing dry electrostatic precipitators, to be a feasible and cost-effective control option. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 11 (Jan. 29, 2024); 89 Fed. Reg. at 16,417.

94. *Controls for Mercury Standards*: Technology to implement the mercury standards is accessible.

95. Wet venturi scrubbers are a demonstrated control technology that can be used to comply with the mercury standard. EPA determined as much in the 2024 Taconite Rule.

96. Wet venturi scrubbers, in addition to effectively controlling acid gases, also have the ability to control mercury. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 8-9 (Jan. 29, 2024).

97. Activated carbon injection is a demonstrated control technology that can be used to comply with the mercury standard. EPA determined as much in the 2024 Taconite Rule.

98. Activated carbon injection is a widely accessible control technology that can be used by taconite facilities to comply with the mercury standard. EPA identified activated carbon injection to be a "commonly used method[ ] for controlling mercury emissions." *Id.* at 8.

99. EPA found activated carbon injection to be a feasible control technology because, when combined with venturi scrubbers that already exist at the majority of operating facilities in the source category, this technology enables each furnace to meet the new mercury standard. *Id.* at 8-9.

100. Activated carbon injection systems have been a well-established technology for several decades, as far back as the 2003 Taconite NESHAP. 68 Fed. Reg. at 61,878, 61,880.

101. Other regulated industries have used activated carbon injection to effectively control mercury emissions, such as facilities operating coal-fired boilers. *See* Minn. Pollution Control Agency, *Estimated Costs Related to the Implementation of the Mercury Reduction Rules*, No. EPA-HQ-OAR-2017-0664-0213, at 2 (July 2013); 68 Fed. Reg. at 61,880.

102. Taconite facilities have piloted activated carbon injection systems, and test results found carbon injection to be the most feasible and least costly method of reducing mercury emissions compared to other controls. *See* Minn. Pollution Control Agency, *Estimated Costs Related to the Implementation of the Mercury Reduction Rules*, at 3-4.

103. Compliance with the 2024 Taconite Rule only requires performance testing and establishment of operating limits for mercury and the installation of a continuous emission monitoring system. Many furnaces would meet the revised limits by using activated carbon injection in combination with existing or upgraded wet venturi scrubbers. Impacts of 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 9 (Jan. 29, 2024). In fact, using activated carbon injection systems in conjunction with preexisting wet venturi scrubbers would yield a maximum mercury removal efficiency of 85 percent. *Id.*

104. EPA found that the combination of activated carbon injection systems and wet venturi scrubbers would allow facilities to meet the new mercury standards, and the revised acid gas limits, set forth in the 2024 Taconite Rule. *Id.* Venturi scrubbers are already installed at each furnace that requires additional controls to meet the new limits, and venturi scrubbers can remove acid gas and mercury emissions. Impacts of Final 2024 Rule Analysis, No. EPA-HQ-OAR-2017-0664-0307, at 9 (Jan. 29, 2024). The control combination of activated carbon

injection systems and venturi scrubbers allows facilities to effectively meet both acid gas and mercury limits.

105. Industry commenters asserted that any updated MACT requirements would impose substantial capital and operating costs that would require multi-year outages and impossible equipment retrofits.

106. EPA's docket demonstrates that these industry arguments are misdirected. EPA explained in the 2024 Taconite Rule that it was not possible to assess the accuracy of industry's proffered cost estimates where industry's capital cost information included no detailed breakdown from which to ascertain what was included in the purported cost and had little supporting documentation. 89 Fed. Reg. at 16,411-12.

107. The 2024 Taconite Rule does not require major installation for most of the existing indurating furnaces in the first place. Although 11 of the existing indurating furnaces would require improved performance to comply with the mercury MACT floor limit, the Agency estimated that installation and operation of activated carbon injection with a high efficiency venturi scrubber would provide the level of required mercury reduction at these furnaces. 88 Fed. Reg. at 30,924.

The Court's Equitable Authority to Review Ultra Vires Executive Action

108. The Taconite Proclamation exceeds the bounds of the President's Section 7412(i)(4) authority by granting sweeping exemptions to all of the regulated sources without making facility-, standard-, or technology-specific determinations.

109. The Taconite Proclamation unlawfully amends the compliance dates of EPA's 2024 Taconite Rule, thus exceeding the bounds of Section 7412(i)(4). Section 7412(i)(4) is a narrow exemption applicable in specific statutorily defined circumstances; it does not give the

ED_021114_00001748-00028

President authority to amend EPA standards or their compliance deadlines. Only EPA may amend those standards and only after notice-and-comment rulemaking.

110. This Circuit allows for review of presidential actions to ensure conformity with statutory requirements, provided that "the authorizing statute or another statute places discernible limits on the President's discretion." *Mountain States Legal Found. v. Bush*, 306 F.3d 1132, 1136 (D.C. Cir. 2002) (citing, *inter alia*, *Chamber of Com. v. Reich*, 74 F.3d 1322, 1331 (D.C. Cir. 1996)).

111. The statutory provision at issue, Section 7412(i)(4), provides such discernable limits on the President's discretion by requiring a determination that, for specific facilities, "technology to implement" a standard "is not available" *and* that the exemption "is in the national security interests of the United States." 42 U.S.C. § 7412(i)(4).

112. The Court therefore has authority to review the Taconite Proclamation to determine whether the President's exercise of statutory authority complied with the statutory conditions on that authority.

113. Indisputable facts demonstrate that the President was applying an unreasonable construction of the statutory conditions under which he may exercise the Section 7412(i)(4) exemption authority.

114. Because a necessary factual predicate required by the Clean Air Act—that the technology to implement "is not available" is not present, the Taconite Proclamation unlawfully exercises authority not conveyed by Section 7412(i)(4).

115. The Court has the power to declare that the Taconite Proclamation is unlawful and *ultra vires* because the necessary factual predicate required by the Clean Air Act is not present, and because the Taconite Proclamation unlawfully exercises authority not conveyed by Section

7412(i)(4), contrary to Congress's explicit restrictions on stay regulations and extensions of compliance deadlines.

CLAIMS FOR RELIEF

COUNT ONE:
Unlawful Executive Action in Violation of the Clean Air Act
(Nonstatutory Review for Violations of Federal Law by Federal Officials; Against All Defendants)

116. Plaintiffs incorporate by reference Paragraphs 1-115.

117. The President has limited authority to exempt stationary sources from duly promulgated hazardous air pollutant regulations solely by virtue of the authority delegated by Congress in 42 U.S.C. § 7412(i)(4). The President lacks any independent authority under the U.S. Constitution to issue the exemptions.

118. Section 7412(i)(4) permits the President to exempt a source from a hazardous air pollutant standard only if "the technology to implement such standard is not available" and if an exemption "is in the national security interests of the United States."

119. Section 7412(i)(4) establishes a judicially manageable standard with clear and precise limits of the sort federal courts routinely construe to determine whether officials have acted consistent with law.

120. Whether technology to implement a standard is or is not available is a discrete, yes-or-no factual inquiry that limits the President's discretion to grant exemptions.

121. There is no statutory basis for the President's indiscriminately broad determination that technology to implement the 2024 Taconite Rule is not available. The President patently misconstrued the statutory terms "technology" and "not available" in purporting to exercise the Section 7412(i)(4) exemptions authority.

122. The Taconite Proclamation's purported determination that technology needed to implement the various new standards of the 2024 Taconite Rule is not available for all taconite iron ore processing facilities is a conclusory statement without specific findings as to any specific standard, any specific technology, or any specific facility.

123. Technology to implement the 2024 Taconite Rule is in fact available. The relevant technologies to implement each aspect of the 2024 Taconite Rule standards are in use among facilities regulated by the 2024 Taconite Rule and/or similar regulated sources. The technology to implement the acid gas standards imposed by the 2024 Taconite Rule already exists at the majority of facilities in the source category, with minimal add-on controls required. And the technology to implement the mercury standards imposed by the 2024 Taconite Rule has been piloted by the taconite industry and used by other regulated industries to effectively reduce mercury emissions.

124. The Taconite Proclamation's purported determination that technology to implement the various standards of the 2024 Taconite Rule is not available is unambiguously contradicted by factual evidence. The Taconite Proclamation contains cursory and conclusory statements without specific findings as to any particular standard, technology, or facility.

125. The President's purported determination that the technology to implement the 2024 Taconite Rule is not available instead rests on an unlimited, untenable interpretation and application of the authority conveyed by Section 7412(i)(4) of the Clean Air Act.

126. Because the President grossly exceeded the bounds of his statutory authority by purporting to exempt stationary sources from standards for which the technology to implement is available, the Taconite Proclamation is plainly in excess of the President's delegated powers and contrary to the statute's specific limitations on those powers.

127. The President's action is contrary to the Clean Air Act and is *ultra vires*.

128. The Court possesses inherent equitable power to "grant injunctive relief . . . with respect to violations of federal law by federal officials." *Armstrong v. Exceptional Child Ctr.*, 575 U.S. 320, 326-27 (2015). Congress has nowhere foreclosed review of the interpretation and application of 42 U.S.C. § 7412(i)(4). There is no alternative statutory procedure for review of Plaintiffs' claim.

129. Because the Taconite Proclamation violates the Clean Air Act and is *ultra vires*, EPA actions implementing or giving effect to the Proclamation likewise violate the Clean Air Act and are *ultra vires*.

COUNT TWO:
Ultra Vires, De Facto Rulemaking Without Statutory Authority
(Nonstatutory Review of Action in Excess of Statutory Authority by federal officer; against all Defendants)

130. Plaintiffs incorporate by reference the allegations of Paragraphs 1-115.

131. Congress required EPA to provide for existing sources' compliance with hazardous air pollutant standards "as expeditiously as practicable" and set concrete boundaries on EPA's flexibility to set compliance deadlines "in no event later than 3 years after the effective date of such standard" with certain exceptions not relevant here. 42 U.S.C. § 7412(i)(3)(A).

132. Congress gave EPA and state permitting authorities discrete, limited authority to grant an existing source "up to 1 additional year to comply with standards" promulgated under subsection (d) "if such additional period is necessary for the installation of controls." 42 U.S.C. § 7412(i)(3)(B).

133. Congress further conferred discrete, limited authority on EPA to stay the effectiveness of rules, including hazardous air pollutant standards, for no more than three

months, during EPA's reconsideration of a rule under certain circumstances. 42 U.S.C. § 7607(d)(7)(B).

134. Congress directed EPA to provide for public notice and comment on EPA actions to revise hazardous air pollutant standards, to alter their compliance dates, or to grant source-specific deadline extensions. 42 U.S.C. § 7607(d)(5), (h).

135. The exemption authority conveyed in Section 7412(i)(4) must be construed congruously with the authorities and limitations Congress enacted in Sections 7412 and 7607.

136. EPA and the President are bound by the Clean Air Act's duties with respect to implementing Section 7412(i)(4), including following rulemaking procedures, and being bound by lawfully adopted regulations.

137. Reading Section 7412(i)(4) to authorize exemptions for the entirety of the regulated source category, from every single standard and other requirement of a rule, without facility- or standard-specific justifications tied to the statutory factors, is contrary to the context, purpose, and structure of the Clean Air Act.

138. The content, context, and scope of the Taconite Proclamation demonstrates that the Proclamation is not a true "exemption" within the meaning of Section 7412(i)(4).

139. The Taconite Proclamation's extremely broad sweep reflects an interpretation of the Section 7412(i)(4) authority that would swallow and render superfluous statutory limits.

140. The Taconite Proclamation is functionally a rulemaking and/or stay pending reconsideration granted without observance of the procedural and substantive limitations Congress enacted in Sections 7412 and 7607 of the Clean Air Act.

141. EPA explicitly invited requests for presidential exemptions explicitly in the context of its announced reconsideration of the 2024 Taconite Rule. It stated that the exemptions

are offered "while EPA reconsiders" the underlying rule. *See* EPA, Clean Air Act Section 112 Presidential Exemption Information, https://perma.cc/24UT-J3KW (last accessed Dec. 8, 2025).

142. The President granted sweeping exemptions from all compliance obligations of the 2024 Taconite Rule to all regulated sources. He did so without particularized consideration of facilities and their particular products and processes, or of the specific standards, technologies, or practices needed to comply. All of these are necessary to determine whether technology is not available to implement the standards.

143. The Taconite Proclamation's purported exercise of Section 7412(i)(4) exemption authority is in fact an exercise of rulemaking and/or stay authority despite the President lacking such power. The Clean Air Act gives only EPA that authority and only after following certain procedures in certain circumstances.

144. The sweeping Taconite Proclamation exceeds the narrow bounds of Section 7412(i)(4) to achieve improper goals prohibited by other provisions of the Clean Air Act. In granting compliance relief that far exceeds the Section 7412(i)(4) authority, the President bypassed and contravened the statutory requirements on rulemaking and stays pending reconsideration to accomplish sweeping compliance exemptions unauthorized by law and in excess of the President's statutory authority.

145. The Taconite Proclamation is beyond the authority conveyed by the Clean Air Act and is *ultra vires*.

146. Because the Taconite Proclamation is beyond the Clean Air Act authority and *ultra vires*, EPA actions implementing or giving effect to the proclamation are similarly *ultra vires*.

RELIEF REQUESTED

WHEREFORE Plaintiffs request that the Court:

A. Declare that the Taconite Proclamation is unlawful and invalid and that the Annex I sources remain subject to the 2024 Taconite Rule as promulgated;

B. Issue injunctive relief:

   i. prohibiting EPA and Administrator Lee Zeldin from implementing, relying on, or giving effect to the Taconite Proclamation, including through implementation of the Clean Air Act's Title V operating permit program where applicable; and

   ii. directing EPA to promptly notify, in writing, the operators of facilities listed in Annex I and relevant state, local, and/or Tribal permitting authorities that the Taconite Proclamation is unlawful and invalid, and that any facilities that the Taconite Proclamation purported to exempt may not lawfully delay or avoid compliance with the deadlines promulgated by the 2024 Taconite Rule by relying on the Taconite Proclamation.

C. Award Plaintiffs their fees and costs of litigation as authorized by law;

D. Grant such other relief as the Court deems just and proper.

Dated: February 2, 2026

INSTRUCTIONS FOR COMPLETING CIVIL COVER SHEET JS 44
Authority for Civil Cover Sheet

The JS-44 civil cover sheet and the information contained herein neither replaces nor supplements the filings and services of pleadings or other papers as required by law, except as provided by local rules of court. This form, approved by the Judicial Conference of the United States in September 1974, is required for the use of the Clerk of Court for the purpose of initiating the civil docket sheet. Consequently, a civil cover sheet is submitted to the Clerk of Court for each civil complaint filed. Listed below are tips for completing the civil coversheet. These tips coincide with the Roman Numerals on the cover sheet.

I. COUNTY OF RESIDENCE OF FIRST LISTED PLAINTIFF/DEFENDANT (b) County of residence: Use 11001 to indicate plaintiff if resident of Washington, DC, 88888 if plaintiff is resident of United States but not Washington, DC, and 99999 if plaintiff is outside the United States.

III. CITIZENSHIP OF PRINCIPAL PARTIES: This section is completed only if diversity of citizenship was selected as the Basis of Jurisdiction under Section II.

IV. CASE ASSIGNMENT AND NATURE OF SUIT: The assignment of a judge to your case will depend on the category you select that best represents the primary cause of action found in your complaint. You may select only one category. You must also select one corresponding nature of suit found under the category of the case.

VI. CAUSE OF ACTION: Cite the U.S. Civil Statute under which you are filing and write a brief statement of the primary cause.

VIII. RELATED CASE(S), IF ANY: If you indicated that there is a related case, you must complete a related case form, which may be obtained from the Clerk's Office.

Because of the need for accurate and complete information, you should ensure the accuracy of the information provided prior to signing the form.

AO 440 (Rev. 06 12) Summons in a Civil Action

UNITED STATES DISTRICT COURT

for the

District of Columbia

Minnesota Center For Environmental Advocacy, et al.

Plaintiff(s)

v.

Donald Trump, et al.

Defendant(s)

Civil Action No. 1:26-cv-287

SUMMONS IN A CIVIL ACTION

To: *(Defendant's name and address)* United States Attorney's Office for the District of Columbia
Civil Process Clerk
U.S. Attorney' s Office for D.C.
601 D Street, NW
Washington, DC 20530

A lawsuit has been filed against you.

Within 21 days after service of this summons on you (not counting the day you received it) or 60 days if you are the United States or a United States agency, or an officer or employee of the United States described in Fed. R. Civ. P. 12 (a)(2) or (3) you must serve on the plaintiff an answer to the attached complaint or a motion under Rule 12 of the Federal Rules of Civil Procedure. The answer or motion must be served on the plaintiff or plaintiff's attorney, whose name and address are: Shampa Panda
Natural Resources Defense Council Inc.
1152 15th St NW #300,
Washington, DC 20005

If you fail to respond, judgment by default will be entered against you for the relief demanded in the complaint. You also must file your answer or motion with the court.

INTRODUCTION

The Clean Air Act protects the nation's air quality through a broad range of programs, each tailored by Congress to address an air pollution problem. As relevant to this action, the Act directs the Environmental Protection Agency ("EPA") to regulate hazardous air pollutants by setting emission standards based on the emissions reductions that are achievable and sufficient to protect public health and the environment.

As a general matter, the statute instructs EPA to promulgate compliance deadlines for emission standards that come into effect within three years. But, recognizing that neither Congress nor EPA could foresee all eventualities, the Clean Air Act reserves a special place for the President to relieve emissions sources from those deadlines. In particular, the President may exempt any stationary source from compliance with an emission standard for a period of not more than two years if the President determines that the technology to implement that standard is not available and that it is in the national security interests of the United States to do so.

President Trump exercised this authority in July 2025, exempting certain chemical manufacturing plants from EPA's 2024 emission standards governing the chemical manufacturing industry. As authorized by the Clean Air Act, the President chose to issue this exemption after determining: (1) that the technology to achieve these standards is not available; and (2) that the exemption is in the national security interests of the United States.

Plaintiffs' Complaint challenges these exemptions on the grounds that the President's technology and national security determinations are erroneous. But Congress has foreclosed review of those determinations by enacting the Clean Air Act's comprehensive judicial review scheme without providing for review of such determinations. The Court should dismiss the Complaint.

BACKGROUND

1. The Clean Air Act

The Clean Air Act contains seven subchapters, each designed to address a particular air pollution problem while advancing the Act's overall goal of "protect[ing] and enhanc[ing] the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population." 42 U.S.C. § 7401(b). Relevant here, Subchapter I addresses air quality and emission limitations.

This case concerns one method of addressing air quality and emission limitations, the National Emission Standards for Hazardous Air Pollutants. Clean Air Act § 112; 42 U.S.C. § 7412. These standards regulate hazardous air pollutants that can cause adverse health or environmental effects, such as asbestos, benzene, and chlorine. *Id.* § 7412(b). The Clean Air Act requires EPA to set standards for categories of sources that emit air toxics. *Id.* § 7412(d). Eight years after setting those standards, EPA must complete a risk review, assessing whether the standards provide "an ample margin of safety" for public health and the environment. *Id.* § 7412(f)(2)(A). Separately, EPA must complete a recurring technology review of these standards every eight years. *Id.* § 7412(d)(6).

When EPA promulgates an emission standard for a category or subcategory of existing sources under CAA section 112, EPA generally must establish a compliance date that provides for compliance as expeditiously as practicable, but in no event later than three years after the standard's effective date. *Id.* § 7412(i)(3)(A). Consistent with other environmental statutes, Congress also provided for certain compliance exemptions. *Id.* § 7412(i).

Specifically as relevant here, when an emission standard implicates national security, the President, rather than EPA, may exempt any source from compliance for a period of not more than two years "if the President determines that the technology to implement such standard is not

available and that it is in the national security interests of the United States to do so." *Id.* § 7412(i)(4). The President may extend this exemption period for additional two-year periods and must report each exemption (or extension) to Congress. *Id.* In contrast to its provisions governing EPA's rulemaking authority, *see id.* § 7607(d), the Act establishes no procedural requirements for the President's exemption authority, *see id.* § 7412(i)(4), and does not subject the President's determinations to judicial review, *see id.* § 7607(b)(1).

2. EPA's 2024 HON Rule

EPA first promulgated emission standards for the synthetic organic chemical manufacturing industry in 1994. 59 Fed. Reg. 19402 (Apr. 22, 1994). Those standards are generally reflected in 40 C.F.R. part 63, subparts F, G, H, and I. EPA first promulgated national emission standards for certain polymer and resins manufacturing sources in 1995 and 1996. 60 Fed. Reg. 12670 (Mar. 8, 1995); 61 Fed. Reg. 46906 (Sept. 5, 1996). Those standards are generally reflected in 40 C.F.R. part 63, subparts U and W.

In April 2023, EPA proposed amendments to these standards based on its periodic technology review of those standards. 88 Fed. Reg. 25080 (Apr. 25, 2023). After considering public comments on the proposed rule, EPA promulgated a final rule in May 2024 entitled, "New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry." 89 Fed. Reg. 42932 (May 16, 2024). That rule is commonly referred to (including by Plaintiffs in their Complaint) as the "HON Rule" because it mainly concerns the various standards for the synthetic organic chemical manufacturing industry, which EPA collectively refers to as the Hazardous Organic NESHAP or HON. The HON Rule set compliance deadlines for meeting the standards as July

15, 2026, or July 15, 2027, depending on the particular standard. HON Rule, 89 Fed. Reg. at 43236.

3. The President's 2025 HON Proclamation

On July 17, 2025, President Trump issued a proclamation under his Clean Air Act section 112(i)(4) authority, 42 U.S.C. § 7412(i)(4), exempting a specified list of stationary sources (Annex I) from the HON Rule for two years. Regulatory Relief for Certain Stationary Sources To Promote American Chemical Manufacturing Security (the "HON Proclamation"), 90 Fed. Reg. 34587 (July 23, 2025). Specifically, the HON Proclamation stated that the President was exempting the Annex I sources from compliance with "those aspects of the HON Rule that were promulgated under section 112 of the Clean Air Act, 42 U.S.C. § 7412 for a period of 2 years beyond the HON Rule's relevant compliance dates[.]" *Id.* at 34587. Thus, for the sources in Annex I the HON Rule will not apply until two years after the rule's compliance deadlines (*i.e.*, until July 15, 2028, for the 2026 compliance deadlines and until July 15, 2029, for the 2027 compliance deadlines). *Id.* The Annex I sources remain regulated by the emission standards in effect before the HON Rule's promulgation.

In support of the exemption, the HON Proclamation stated that the nation's domestic chemical manufacturing sector was vital to "safeguarding the supply chains that underpin our economy and to reducing the Nation's dependence on foreign control over materials critical to national resilience," citing the need for continued domestic production in light of expanded adversary influence over foreign manufacture. *Id.* The HON Proclamation also stated that many of the HON Rule's testing and monitoring requirements were not available because they have not been demonstrated at the necessary scale or cannot be implemented safely or consistently under real-world conditions, considering the "significant variation in site conditions, permitting realities, and equipment configurations" across diverse facilities. *Id.*

Based on the foregoing, the President made two determinations in support of the exemption. First, he determined that the technology to implement the HON Rule was not available because it "does not exist in a commercially viable form sufficient to allow implementation of and compliance with the HON Rule" by the compliance deadlines. *Id.* Second, he determined that it is "in the national security interests of the United States to issue this Exemption for the reasons stated" in the Proclamation. *Id.*

4. Plaintiffs' Challenges

Plaintiffs are ten organizations and associations that allege they have members who "live, work, and recreate in areas affected by the excess pollution that is and will be emitted from the exempted facilities." Dkt. No. 1 ¶ 129. Plaintiffs brought the instant suit against President Trump, EPA, and EPA Administrator Lee Zeldin on October 22, 2025, and upon Defendants' motion the Court extended the deadline to answer to January 29, 2026. Minute Order (Dec. 5, 2025), Dkt. No. 32.

In their Complaint, Plaintiffs seek a declaration that the HON Proclamation is unlawful and they seek an injunction preventing EPA from effectuating the exemption. Compl. ¶¶ 149–183; ¶¶ A–B. Plaintiffs identify two claims for relief in their Complaint, both styled as "nonstatutory review." *Id.* at pp. 37, 40. Count One alleges that the President has violated the Clean Air Act by issuing the exemption. *Id.* at p. 37. Count Two alleges that the President lacked authority to issue the exemption here. *Id.* at p. 40.

STANDARD OF REVIEW

Federal courts have "limited jurisdiction" and "possess only that power authorized by Constitution and statute." *Kokkonen v. Guardian Life Ins. Co. of Am.*, 511 U.S. 375, 377 (1994) (citations omitted). Thus, before a federal district court may consider the merits of a lawsuit, it

ED_021114_00001917-00012

must determine it has subject matter jurisdiction to preside over the issue(s) raised. *Steel Co. v. Citizens for a Better Env't*, 523 U.S. 83, 94 (1998). There is a presumption against subject matter jurisdiction, and "the burden of establishing the contrary rests upon the party asserting jurisdiction." *Kokkonen*, 511 U.S. at 377 (citation omitted).

In deciding a Rule 12(b)(1) motion to dismiss for lack of subject matter jurisdiction, the court must "accept as true all the factual allegations in the complaint." *Leatherman v. Tarrant Cnty. Narcotics Intel. & Coordination Unit*, 507 U.S. 163, 164 (1993) (citing *United States v. Gaubert,* 499 U.S. 315, 327 (1991)). But the court is not limited to the allegations in the complaint; the court may also consider "such materials outside the pleadings as it deems appropriate to resolve the question whether it has jurisdiction in the case." *Bates v. Rumsfeld*, 271 F. Supp. 2d 54, 60 (D.D.C. 2002) (citation omitted).

A motion under Rule 12(b)(6) "challenges the adequacy of a complaint on its face, testing whether a plaintiff has properly stated a claim." *Davis v. Sarles*, 134 F. Supp. 3d 223, 226 (D.D.C. 2015). In making its determination on a 12(b)(6) motion, the court may "consider the facts alleged in the complaint, documents attached as exhibits or incorporated by reference in the complaint, and matters about which the Court may take judicial notice." *Gustave-Schmidt v. Chao*, 226 F. Supp. 2d 191, 196 (D.D.C. 2002) (citation omitted). The court may also consider "documents 'upon which the plaintiff's complaint necessarily relies' even if the document is produced not by the plaintiff in the complaint but by the defendant in a motion to dismiss." *Hinton v. Corr. Corp. of Am.*, 624 F. Supp. 2d 45, 46 (D.D.C. 2009) (quoting *Parrino v. FHP, Inc.*, 146 F.3d 699, 706 (9th Cir. 1998)).

ARGUMENT

Plaintiffs' Complaint disavows a cause of action against the President and EPA under either the Clean Air Act or the Administrative Procedure Act. *See* Compl. at pp. 37, 40

ED_021114_00001917-00013

("nonstatutory review"). Thus, it appears Plaintiffs attempt to "dress up a typical statutory-authority argument as an ultra vires claim." *NRC v. Texas*, 605 U.S. 665, 682 (2025). However, ultra vires review is extremely narrow and is "unavailable . . . if a statutory review scheme forecloses all other forms of judicial review" and only applies if an agency taken action "entirely in excess of its delegated powers and contrary to a *specific prohibition*" in a statute. *Id.* at 681 (emphasis in original, quotation and internal citation omitted).

The Court should dismiss the Complaint on this basis. First, ultra vires review is unavailable because the Clean Air Act forecloses such review. Second, even if review were available, the President has not acted in excess of his delegated powers or contrary to a specific prohibition in the Clean Air Act. Third, EPA has not taken any reviewable final action and so is not a proper party to this challenge to presidential action. Fourth, as an alternative, the Court should significantly narrow the scope of the Complaint because Plaintiffs lack standing to challenge many of the exempted facilities.

1. The Clean Air Act's Comprehensive Judicial Review Scheme Bars Review of the President's HON Proclamation.

The Court should dismiss the Complaint because Congress has foreclosed Plaintiffs' nonstatutory review claims in the context of Clean Air Act presidential exemptions.

The Clean Air Act sets forth a comprehensive and unambiguous judicial review scheme that governs both review of governmental action, 42 U.S.C. § 7607, and governmental inaction, 42 U.S.C. § 7604. Clean Air Act section 307 governs review of EPA action by individually listing each type of EPA action seriatim and then assigning review of those actions to either the regional courts of appeals or the District of Columbia Circuit. 42 U.S.C. § 7607(b)(1). In such cases, section 307 also establishes the record for review, the standard of review, and the available causes of action. *Id.* § 7607(d). And finally, if that was not enough, it provides that other methods

of judicial review are not authorized "except as provided in this section." *Id.* § 7607(e); *see Oljato Chapter of Navajo Tribe v. Train*, 515 F.2d 654, 664 (D.C. Cir. 1975) (Clean Air Act supplants APA review). The Supreme Court has interpreted section 307(b)(1) broadly to cover every way EPA may exercise its power under the Clean Air Act. *See Harrison v. PPG Indus., Inc.*, 446 U.S. 578, 587 89 (1980) (phrase "any other final action" is to be construed literally to reach any final EPA action). For cases of agency inaction, Congress created a specific cause of action in district court to challenge an alleged failure to perform "any act or duty under this chapter which is not discretionary," 42 U.S.C. § 7604(a)(2), subject to the express condition of advance notice, *id.* § 7604(b).

Where, as here, Congress has provided "a detailed mechanism for judicial consideration of particular issues at the behest of particular persons," the Court has rejected challenges falling outside of that scheme. *Block v. Cmty. Nutrition Inst.*, 467 U.S. 340, 349 (1984). In *Block*, for instance, the Secretary of Agriculture was authorized to issue orders regulating the milk market under the Agricultural Marketing Agreement Act of 1937. *Id.* at 342. The statute authorized dairy handlers to challenge those orders using a bespoke statutory procedure but was silent about milk consumers' rights. *Id.* at 346–347. Notwithstanding the lack of an express statement that such judicial review was precluded, the Court had no difficulty in concluding that "congressional intent to preclude judicial review [was] 'fairly discernible' in the detail of the legislative scheme." *Id.* at 351.

Likewise with the Clean Air Act, Congress has clearly indicated that judicial review of presidential exemptions under section 112(i)(4) is unavailable. First, Congress did not include presidential exemptions in the list of actions that the Clean Air Act subjects to judicial review, despite its near-exhaustive list of other types of reviewable actions. *See* 42 U.S.C. § 7607(b)(1)

ED_021114_00001917-00015

(listing only actions of "the Administrator"). Second, Congress required the President to "report" each exemption to itself. *Id.* § 7412(i)(4). While congressional supervision "does not provide the immediate protection that the [plaintiff] seeks, it does evince a congressional intent to review the President's decisions and safeguard the environmental interests at stake itself." *Colon v. Carter*, 633 F.2d 964, 967 (1st Cir. 1980).

Plaintiffs accordingly cannot satisfy the first prong of ultra vires review—that Congress has not already acted to foreclose judicial review. The Court should dismiss the Complaint on that basis.

2. To the Extent Ultra Vires Review is Available Outside of the Clean Air Act, How the President Exercised his Exemption Discretion Remains Unreviewable.

Even assuming that Plaintiffs may seek judicial review outside of the narrow confines of the Clean Air Act, the Court should nonetheless dismiss this action. As an unbroken line of Supreme Court precedent makes clear, where a statute "commits decisionmaking to the discretion of the President, judicial review of the President's decision is not available." *Dalton v. Specter*, 511 U.S. 462, 477 (1994); *see also Trump v. Hawai'i*, 585 U.S. 667 (2018); *Franklin v. Massachusetts*, 505 U.S. 788 (1992); *Chi. & S. Air Lines, Inc. v. Waterman S. S. Corp.*, 333 U.S. 103 (1948); *United States v. George S. Bush & Co.*, 310 U.S. 371 (1940); *Dakota Cent. Tel. Co. v. South Dakota ex rel. Payne*, 250 U.S. 163 (1919).

As stated above, Plaintiffs' Complaint does not appear to include claims under the Administrative Procedure Act's or Clean Air Act's judicial review mechanisms and so Defendants assume that Plaintiffs are attempting to bring a nonstatutory ultra vires claim. The scope of review in such a challenge is extremely narrow, comprising at most review for constitutionality and whether the President exceeded a specific statutory prohibition on his authority. *See Franklin*, 505 U.S. at 801 (presidential acts may be reviewed for constitutionality

but not abuse of discretion.);); *see also Glob. Health Council v. Trump*, 153 F.4th 1, 20 (D.C. Cir. 2025) ("To prevail on an ultra vires claim, a plaintiff must establish that (1) review is not expressly precluded by statute, (2) there is no alternative procedure for review of the statutory claim and (3) the challenged action is plainly in excess of [the President's] delegated powers and contrary to a specific prohibition in the statute that is clear and mandatory." (internal quotations omitted)).

Plaintiffs assert no constitutional challenge. Therefore, this Court's review is limited to whether the President has exceeded the statute's limitations. For that analysis, this Court must circumscribe its review to asking (a) whether the statute confers the discretion that the President has exercised; and (b) whether the President exceeded a specific statutory prohibition on his authority. *See Hawai'i*, 585 U.S. at 686 88 (first discussing whether the Immigration and Nationality Act gives the President discretion to suspend entry of noncitizens based on nationality, then reviewing whether the President's action comported with "any textual limit on the President's authority"); *NRC*, 605 U.S. at 681 (ultra vires review applies only when an agency has taken action both (1) entirely in excess of delegated powers and (2) contrary to a specific prohibition). Judicial review is not available to evaluate "the President's judgment as to the existence of the facts on which his discretionary judgment is based," or "to assess a particular exercise of presidential discretion." *Utah Ass'n of Cntys. v. Bush*, 316 F. Supp. 2d 1172, 1186 (D. Utah 2004); *see also Dalton*, 511 U.S. at 474 (assuming *arguendo* that courts may review whether the President has violated a statutory mandate outside the framework of the Administrative Procedure Act, "longstanding authority holds that such review is not available when the statute in question commits the decision to the discretion of the President").

Applied to the HON Proclamation in this case, Clean Air Act section 112(i)(4) fits squarely within the category of statutes that commit discretion to the President. In contrast to the remainder of section 112, which instructs that EPA "shall" take various actions in a specific sequence, section 112(i)(4) states that the President "may" exempt any stationary source from compliance with "any standard or limitation under" section 112, so long as the President makes the necessary determinations, limits the exemption to two years, and reports to Congress. 42 U.S.C. § 7412(i)(4). "May" does "not just suggest discretion, it clearly connotes it." *Biden v. Texas*, 597 U.S. 785, 802 (2022) (emphasis and internal quotation marks omitted). "That connotation is particularly apt where, as here, 'may' is used in contraposition to the word 'shall.'" *Id.* (quoting *Jama v. ICE*, 543 U.S. 335, 346 (2005)). Likewise, Congress's use of the word "determines" reflects the culmination of Presidential decision-making, as opposed to discrete and easily discernible procedural checkboxes more amenable to judicial second-guessing. *Cf. Heckler v. Chaney*, 470 U.S. 821, 831 (1985) ("[A]n agency's decision not to prosecute or enforce, whether through civil or criminal process, is a decision generally committed to an agency's absolute discretion."). The statute's explicit reference to national security concerns reinforces that conclusion. The D.C. Circuit has cautioned that "courts are not a forum for reconsidering the wisdom of discretionary decisions made by the political branches in the realm of foreign policy or national security." *El-Shifa Pharm. Indus. Co. v. United States*, 607 F.3d 836, 842 (D.C. Cir. 2010). Thus, there can be no doubt from the plain text of the statute that President Trump was within the boundaries of the authority Congress conferred upon him when he issued the exemption. *See Hawai'i*, 585 U.S. at 684 ("[8 U.S.C. §] 1182(f) vests the President with 'ample power' to impose entry restrictions." (citation omitted)).

ED_021114_00001917-00018

Moreover, Plaintiffs cannot satisfy the next prong of ultra vires review that the President violated a "*specific prohibition*" against his action in the Clean Air Act. *NRC*, 605 U.S. at 681. The exemption applies only to specific "standards" set by EPA — namely, "those aspects of the HON Rule that were promulgated under section 112 of the Clean Air Act." 90 Fed. Reg. at 34587. The exemption lasts only the duration allowed by the statute — two years. *Id.* And the exemption is predicated on the determinations required by statute—that the "technology to implement the HON Rule is not available" and the exemption is "in the national security interests of the United States[.]" *Id.* at 34588. The President therefore complied with the Clean Air Act by exercising no more than the discretion entrusted to him in the statute and by complying with the limitations Congress placed on that discretion; that is, by making the required determinations in support of an exemption that clearly falls within the statute. *See Hawai'i*, 585 U.S. at 686–88; *NRC*, 605 U.S. at 681.

The Complaint's proposed scope of judicial review vastly exceeds the limited jurisdiction recognized by the precedents cited above. Though Plaintiffs attempt to set up a dispute over the Clean Air Act's meaning by casting their claim as the President "misconstru[ing]" the Clean Air Act, *e.g.*, Compl. ¶¶ 154, 160, the gravamen of the Complaint is that Plaintiffs disagree with the President's determinations on technology availability and national security. For instance, Plaintiffs would have this Court make factual inquiries into whether "[t]echnology to implement the 2024 HON Rule is in fact available" *id.* ¶ 156, and whether the domestic chemical manufacturing industry's inputs and outputs actually "have any national security nexus," *id.* ¶ 162. Likewise, Plaintiffs allege that the President "grossly exceeded the bounds of his statutory authority" because "the technology to implement is available and the exemptions do not further national security interests." *Id.* ¶ 165.

The Court should reject Plaintiffs' requests to expand judicial review of the President's factual determinations in violation of Supreme Court precedent. Even setting aside the mind-boggling discovery and trial proofs that would be necessary for this Court to complete a nationwide review of the chemical manufacturing industry, available technology, and the nexus to national security, engaging in that sort of review would enmesh this Court in questions of "Presidential discretion as to political matters beyond the competence of the courts to adjudicate." *Dalton*, 511 U.S. at 475 (quotation omitted). Indeed, Plaintiffs' request for "a searching inquiry into the persuasiveness of the President's justifications is inconsistent with the broad statutory text and the deference traditionally accorded the President in this sphere." *Hawai'i*, 585 U.S. at 686. In such circumstances, the Supreme Court has never required the President to make a predicate determination in "sufficient detail to enable judicial review." *Id.*

The Court should therefore dismiss Counts One and Two against the President for lack of jurisdiction and failure to state a claim.

3. EPA Has Not Taken Action to Implement the HON Proclamation and is Not a Proper Party Here.

Even assuming that ultra vires review is available here despite the Clean Air Act's comprehensive scheme, the Complaint likewise fails to state a claim against EPA because EPA has not taken any action susceptible to review under the Clean Air Act, Administrative Procedure Act, or ultra vires review.

First, under the Clean Air Act, EPA is not a proper party here. As with the Administrative Procedure Act, which does not permit judicial review before "agency action" is "final," 5 U.S.C. § 704, lawsuits against EPA under the Clean Air Act are not ripe until EPA has taken "final action." 42 U.S.C. § 7607(b); *see also Sierra Club v. EPA*, 873 F.3d 946, 951 (D.C. Cir. 2017) ("[F]inal action" in the Clean Air Act is synonymous with "final agency action" in the

Administrative Procedure Act.). "Final action" means "action" that (1) marks the "consummation of the agency's decisionmaking process" and (2) is one "by which rights or obligations have been determined, or from which legal consequences will flow." *Bennett v. Spear*, 520 U.S. 154, 177–78 (1997) (citations and internal quotation marks omitted). Plaintiffs have failed to identify any official EPA act that even remotely qualifies as "action" under this standard; nor can they, as EPA has done nothing to implement the HON Proclamation.

Second, assuming that EPA can be sued for Clean Air Act violations on an ultra vires theory, Plaintiffs fail to allege that EPA has taken action that violates a specific provision of the Clean Air Act. The Clean Air Act is comprehensive and unambiguous in its division of authority between EPA, States, and the President. In the normal course, Congress entrusted EPA with setting standards and compliance deadlines for regulating hazardous air pollutants. *Id.* § 7412(d), (i)(3). But in the unique case of national security, Congress entrusted the President, and *only* the President, with the authority to issue an exemption. *Id.* § 7412(i)(4). The statutory text is clear that EPA has no role in effectuating such national security exemptions, and the Complaint does not allege that EPA has taken any action to do so here. Accordingly, the Complaint fails to allege that EPA is violating or plans to violate federal law. *See Dart v. United States*, 848 F.2d 217, 224 (D.C. Cir. 1988) ("When an executive *acts* ultra vires, courts are normally available to reestablish the limits on his authority." (emphasis added)).

Moreover, to the extent that Plaintiffs seek to include EPA in this case on the speculative theory that EPA might take some action *in the future* to implement the HON Proclamation, that theory is neither ripe nor an avenue for relief where the real party in question is the President. Certainly, final agency action is traditionally reviewable when Congress has entrusted authority and discretion to act to an agency head, even if the President directs how he wishes that agency

to proceed. But, as discussed above, when Congress enacts a statute entrusting discretion to the President, how the President exercises that discretion is not reviewable. *Dalton*, 511 U.S. at 476. The mere fact that a plaintiff sues an agency defendant who will ministerially implement that exercise of discretion does not transmute the claim from unreviewable to justiciable. *Id.*; *see also Chi. & S. Air Lines, Inc.*, 333 U.S. at 113–14 (no review of Civil Aeronautics Board decision where statute committed discretion to review decision to President, even though organic act generally permitted judicial review).

The Supreme Court reaffirmed this longstanding distinction between agency action delegated to an agency head and agency action implementing discretion vested in the President only last year. *See Trump v. Orr*, 146 S. Ct. 44, 46 (2025). In the context of the federal passport issuance law, the State Department issues passports "under such rules as the President shall designate and prescribe." 22 U.S.C. § 211a. When certain plaintiffs sought to challenge President Trump's executive order governing sex on passports, the Supreme Court granted a stay application from the State Department seeking relief from an order against its implementation of that directive. *See Orr*, 146 S. Ct. at 46. The Court explained that respondents were not likely to prevail in "arguing that the State Department acted arbitrarily and capriciously by declining to depart from *Presidential rules that Congress expressly required it to follow*." *Orr*, 146 S. Ct. at 46 (emphasis added; citing 22 U.S.C. § 211a).

So too here. The Clean Air Act entrusts the decision whether to grant an exemption entirely to the President. 42 U.S.C. § 7412(i)(4). Any future EPA action to implement an exemption (in addition to being unripe, not plausibly alleged, and speculative) would be merely ministerial and not subject to review. The Court should therefore dismiss EPA and Administrator Zeldin as Defendants because they have taken no action susceptible to challenge.

4. Plaintiffs Lack Standing to Challenge the HON Proclamation's Exemptions for 39 Facilities.

Finally, Plaintiffs lack Article III standing to challenge the HON Proclamation's exemptions for 39 of the 50 facilities identified in Annex I. To the extent the Court does not dismiss the Complaint in full for the reasons described above in Sections I and II, it should narrow the Complaint and consider relief only with regard to the 11 facilities that Plaintiffs have alleged concretely affect their members.

Standing requires that a plaintiff have "a personal stake in the outcome of the controversy [so] as to warrant his invocation of federal-court jurisdiction." *Warth v. Seldin*, 422 U.S. 490, 498 (1975). A plaintiff seeking relief must establish the three elements constituting the "irreducible constitutional minimum" of Article III standing. *Lujan v. Defs. of Wildlife*, 504 U.S. 555, 560 (1992). The plaintiff has the burden of showing: "that it has suffered a concrete and particularized injury that is: (1) actual or imminent; (2) caused by or fairly traceable to, an act that the litigant challenges in the instant litigation; and (3) redressable by the court." *Fla. Audubon Soc'y v. Bentsen*, 94 F.3d 658, 663 (D.C. Cir. 1996) (internal quotation and citation omitted). The injury cannot be "'conjectural or hypothetical.'" *Spokeo, Inc. v. Robins*, 578 U.S. 330, 339 (2016) (quoting *Lujan*, 504 U.S. at 560).

A plaintiff organization, like the ten Plaintiffs here, may establish "associational standing" based on injury to its members by showing that "(a) its members would otherwise have standing to sue in their own right; (b) the interests it seeks to protect are germane to the organization's purpose; and (c) neither the claim asserted nor the relief requested requires the participation of individual members in the lawsuit." *Hunt v. Wash. State Apple Adver. Comm'n*, 432 U.S. 333, 343 (1977). Alternatively, to show standing on its own behalf, the organization itself must meet the same standing test that applies to individuals: an actual or threatened injury

in fact that is fairly traceable to the defendant's allegedly unlawful conduct and likely to be redressed by a favorable court decision. *Am. Soc. for Prevention of Cruelty to Animals v. Feld Ent., Inc.*, 659 F.3d 13, 24 (D.C. Cir. 2011).

Plaintiffs' Complaint asserts standing based on two types of alleged injuries: (1) harm from "increased exposure to hazardous air pollutants as a result of the HON Proclamation," Compl. ¶ 134, and their members' concerns about such increased exposure, Compl. ¶ 142–148; and (2) an informational injury on the grounds that exempt facilities are no longer required to conduct "fenceline monitoring," reports of which Plaintiffs allege must be made available to the public, Compl. ¶¶ 134 141.[1] As for relief, Plaintiffs seek a declaration from this Court that the Proclamation "is unlawful and invalid and that the Annex I sources remain subject to the 2024 HON Rule." *See* Compl. § "Relief Requested." But, as detailed below, Plaintiffs have not pleaded facts sufficient to support their allegations of injury from the increased emissions at 39 of the exempted facilities listed in Annex I. Additionally, Plaintiffs claim of informational injury fails because they do not have a right to the information they seek.

A. Plaintiffs Have Not Sufficiently Alleged Injury Resulting from All Exempted Facilities.

As noted above, Plaintiffs allege that their members are harmed by "excess" exposure to hazardous air pollutants because the HON Proclamation exempted 50 facilities listed in its Annex I from compliance with the HON Rule. Compl. ¶¶ 1, 129–134. Yet Plaintiffs allege facts supporting harm to their members arising from "excess" emissions at only 11 of the facilities listed in Annex I.[2] Compl. ¶¶ 142–148. With respect to the remaining 39 facilities, Plaintiffs have

[1] Fenceline monitoring refers to monitoring for specific air pollutants along the perimeter of the facility's property line.

[2] Plaintiffs identify members with concerns regarding the following exempted facilities: (1) Citgo Petroleum Corporation's Lemont Refinery in Illinois; (2) Denka Performance's

ED_021114_00001917-00024

not pleaded any facts to support their assertion that their members have been or will be harmed by excess emissions from those facilities. And Plaintiffs' generic assertion that their members will be harmed by breathing air pollution from exempted facilities lacks any factual support. *See* Compl. ¶ 129. It is long accepted that allegations of "generalized harm to . . . the environment will not alone support standing." *Summers v. Earth Island Inst.*, 555 U.S. 488, 494 (2009); *see also Lujan v. Nat'l Wildlife Fed'n*, 497 U.S. 871, 889 (1990) (holding that requirements of standing are not met when plaintiff alleges harm in an "immense tract of territory"). Moreover, any alleged general harm caused by potential "excess" emissions is nonsensical because the exemptions are, at most, delaying *reductions* by a period of two years, not allowing for increased emissions. *See* 90 Fed. Reg. at 34587.

Similarly, Plaintiffs have not alleged a specific injury to their organizations that could support standing in their own right. Plaintiffs' alleged injury to their advocacy efforts, *see* Compl. ¶ 139, is not sufficient because organizations that "seek to do no more than vindicate their own value preferences through the judicial process" generally cannot establish standing. *Sierra Club v. Morton*, 405 U.S. 727, 740 (1972); *see also Food & Drug Admin. v. All. for Hippocratic Med.*, 602 U.S. 367, 381 (2024). Thus, Plaintiffs have not alleged facts sufficient to support associational standing.

B. Plaintiffs Cannot Establish Standing Based on an Informational Injury.

Moreover, Plaintiffs cannot establish standing (for the 39 facilities described above, or any other facility) based on an alleged informational injury because they are not entitled to the

---

Elastomer facility in Louisiana; (3) DuPont Specialty Products' Pontchartrain facility in Louisiana; (3) BASF's North Geismar facility in Louisiana; (4) BASF's Geismar facility in Louisiana; (5) Shell's Geismar facility in Louisiana; (6) Westlake Vinyl's facility in Ascension Parrish, Louisiana; (7) Formosa Plastics' facility in Baton Rouge, Louisiana; (8) Dow's facility in Plaquemine, Louisiana; (9) BASF's facility in Freeport, Texas; (10) Celanese's Clear Lake facility in Texas; and (11) Ineos Styrolution's facility in Texas. Compl. ¶¶ 142–148.

fenceline monitoring reports they seek. To establish injury in fact based on informational interests, Plaintiffs must demonstrate: (1) they have been deprived of information that, in their interpretation, *a statute* requires the government or a third party to disclose to them; and (2) they suffer, by being denied access to that information, the type of harm Congress sought to prevent by requiring disclosure. *Friends of Animals v. Jewell*, 828 F.3d 989, 992 (D.C. Cir. 2016). Although the D.C. Circuit has, in the past, found that an organization may have standing based on informational harm even though the organization had no legal right to it, *Am. Anti-Vivisection Soc'y v. U.S. Dep't of Agric.*, 946 F.3d 615, 619 (D.C. Cir. 2020) (citation omitted), "the Supreme Court has since 'cautioned against'" that approach, *Indep. Mkt. Monitor for PJM v. FERC*, 162 F.4th 1167, 1173 (D.C. Cir. 2025) (quoting *Ctr. for Biological Diversity v. U.S. Dep't of the Interior*, 144 F.4th 296, 315 (D.C. Cir. 2025)). Moreover, even if a plaintiff organization can show that its interests are harmed, it must, to establish standing, also show that it has used resources to counteract that harm. *PETA v. Dep't of Agric.*, 797 F.3d 1087, 1094 (D.C. Cir. 2015).

Here, Plaintiffs have not established that they (or their members) are legally entitled to the fenceline monitoring reports that they seek. It is true that the HON Rule requires facilities to conduct fenceline monitoring and submit monitoring reports to EPA. HON Rule, 89 Fed. Reg. at 43227 34, 43254, 43260. Additionally, under the Clean Air Act, to the extent EPA receives monitoring reports, it must make them available to the public. *See* 42 U.S.C. § 7414(c). However, *the Clean Air Act* does not require that EPA collect fenceline monitoring reports in the first instance; that requirement came from EPA's decision to impose such reporting in the HON Rule. Absent that legal duty, Plaintiffs cannot claim an entitlement to monitoring reports that the statute does not require. *See Jewell*, 828 F.3d at 992; *NRDC v. Bodine*, 471 F. Supp. 3d 524, 535

(S.D.N.Y. 2020) (finding no informational injury to support standing where plaintiff had not demonstrated legal entitlement to information).

But, even if the Court were to find that such entitlement exists and accept as true Plaintiffs' allegation that their organizational missions have been harmed by EPA's failure to provide monitoring reports (that are not statutorily required), Plaintiffs must also show that they have "used [their] resources to counteract that harm." *PETA,* 797 F.3d at 1094. Plaintiffs' Complaint does not contain any allegations that they have expended resources to ameliorate the alleged harm to their missions. *See Indep. Mkt. Monitor for PJM*, 162 F.4th at 1174 (finding no standing based on alleged informational injury where plaintiff "does not identify programmatic expenditures it must make to fill the gap caused by [the] absence" of information) (internal quotations omitted). Thus, Plaintiffs have not adequately alleged an informational injury.

CONCLUSION

The Complaint seeks injunctive relief against the President for exercising discretion conferred upon him by Congress and for which Congress foreclosed judicial review. That exercise of discretion is accordingly unreviewable, and including EPA as a party makes no difference to that fundamental principle. The Court should dismiss the Complaint.

Dear Administrator Zeldin:

Re: ***United States Steel Corporation – Edgar Thomson Plant, Gary Works, Granite City Works, and Great Lakes Works***
Request for Clean Air Act Section 112(i)(4) Presidential Exemption from National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities, 89 Fed. Reg. 23,294 (April 3, 2024)

United States Steel Corporation (U. S. Steel) respectfully requests a two-year Presidential Exemption for the compliance with the 2024 amendments to the National Emission Standards for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities, 89 Fed. Reg. 23,294 (April 3, 2024 (the "IIS RTR Rule") for the following U. S. Steel integrated iron and steel manufacturing facilities[1]:

- **United States Steel Corporation - Mon Valley Works, Edgar Thomson Plant**
  13th Street and Braddock Avenue
  Braddock, Pennsylvania 15104

- **United States Steel Corporation - Gary Works**
  One North Broadway
  Gary, Indiana 46402

- **United States Steel Corporation – Granite City Works**
  20th and State Street
  Granite City, Illinois 62040

- **United States Steel Corporation – Great Lakes Works**
  1 Quality Drive
  Ecorse, Michigan 48229

[1] U. S. Steel is requesting a Presidential Exemption for its Granite City Works located at 20th and State Street in Granite City Illinois, and its Great Lakes Works located at 1 Quality Drive, Ecorse, Michigan. The facilities are currently idled but could be put back online, and if so, an exemption is necessary and appropriate for these facilities as well.

As specifically noted herein, technology to implement the requirements to comply with the IIS RTR Rule is not available, which has been recognized as including "unavailable in time for installation and operation,"[2] and it is in the national security interests which includes economic security,[3] interests of the United States that a two-year Presidential Exemption be granted.

On March 12, 2025, EPA announced that it was taking appropriate action to advance President Trump's initiative of "Powering the Great American Comeback." As part of that effort, EPA indicated that it was reconsidering the IIS RTR Rule as well as several other rules; and advised that "any source interested in a Presidential exemption, should provide their recommendations to EPA by March 31, 2025;" and that sources need only provide why technology is unavailable and why it is in the national security interests of the United States to provide the exemption. In response to that announcement, and consistent with our previously submitted petition for judicial review, and petition for administrative stay and reconsideration, U. S. Steel is submitting its request for a Presidential Exemption pursuant to Clean Air Act Section 112(i)(4) for the IIS RTR Rule for the above-referenced integrated iron and steel facilities owned by U. S. Steel.

EXECUTIVE SUMMARY

U. S. Steel is respectfully requesting a two-year Clean Air Act § 112(i)(4) Presidential Exemption from all of the 2024 amendments to the IIS RTR Rule because, as U. S. Steel has clearly shown in prior submissions to EPA, no integrated iron and steel facility is actually meeting the HAP limits; nor does any integrated iron and steel facility employ technology that demonstrates the limits can consistently be met. Furthermore, even outside the integrated iron and steel industry, no technology exists that has demonstrated that the limits can consistently be met. U. S. Steel's efforts to comply with the 2024 amendments would result in significant, adverse financial and operational impacts to the company and the domestic steel industry. Without a Presidential Exemption, U. S. Steel's and the domestic steel industry's ability to provide for infrastructure, investments and national security would be significantly compromised.

EXEMPTION REQUEST

The President has the authority to grant exemptions from NESHAP emissions standards of up to two years pursuant to Clean Air Act (CAA) § 112(i)(4) and 40 C.F.R. § 63.6(j).

U. S. Steel is requesting a two-year Presidential Exemption, with the possibility to extend the exemption for additional periods if necessary and appropriate as authorized under the Clean

[2] 90 Fed. Reg. 6,773, 6,774 (Jan. 17, 2025).

[3] *See* America First Investment Policy, https://www.whitehouse.gov/presidential-actions/2025/02/america-first-investment-policy/ (Feb. 21, 2025) ("Economic security is national security.")

Air Act, for the IIS RTR Rule compliance requirements for its three integrated iron and steel manufacturing facilities, as identified above. U. S. Steel specifically requests a two-year Presidential Exemption to the amendments to the 2024 National Emission Standards for Hazardous Air Pollutants (NESHAP) for its Integrated Iron and Steel Manufacturing Facilities, which imposes unavailable technology and impractical, impossible, unsafe requirements including:

- New fugitive emissions work practices, observations, planning, reporting, recordkeeping and other requirements for Blast Furnace Bell Leaks, Unplanned Bleeder Valve Openings, Planned Bleeder Valve Openings, Slag Processing, Handling, and Storage Operations; and Beaching; (*See amendments to 40 CFR 63 Subpart FFFFF, including but not limited to 40 CFR §§ 63.7793(c), (c)(1), and (c)(2); 63.7793(d), (d)(1), and (d)(2); 63.7793(e), (e)(1), and (e)(2)); 63.7783(g), (g)(1), (g)(2), (g)(3) and (g)(4); 63.7800(b)(8) and (b)(9); 63.7821(i) 63.7821(k),(k)(1) and (k)(2); 63.7821(l); 63.7823(f), (f)(1) and(f)(2); 63.7823(g), (g)(1), (g)(2) and (g)(3); 63.7823(h)(1)-(2); 63.7833(j), (j)(1) and (j)(2); and 63.7842(d);); and 63.7783(g); 63.7793(b), (b)(2)-(7)* (b)(3); *63.7821(j); 63.7823(f); 63.7823(g), (g)(1), and (g)(2); 63.7823(h); and Subpart FFFFF Tables 1, 2, 3, 4, 5, and 6).*

- New carbonyl sulfide (COS), carbon disulfide (CS2), mercury (Hg), hydrochloric acid (HCl), and hydrogen fluoride (HF) standards and associated performance testing, monitoring, reporting, and recordkeeping requirements; and revised standards and associated monitoring, reporting, and recordkeeping requirements for D/F (TEQ) and polycyclic aromatic hydrocarbons (PAH) for sinter plants; (*See amendments to 40 CFR 63 Subpart FFFFF, including but not limited to 40 CFR §§ 63.7783(g), (g)(1), (g)(2), (g3), and (g)(4); 63.7821(f);63.7821(g) and Subpart Tables 1, 2, 3, 4, 5, and 6.)*

- New Total hydrocarbons (THC), HCl, and dioxins/furans (D/F) or TEQ standards and associated performance testing, monitoring, reporting, and recordkeeping requirements for blast furnace (BF) stoves and basic oxygen process furnaces (BOPF); (*See amendments to 40 CFR 63 Subpart FFFFF, including but not limited to 40 CFR §§ 63.7783(g), (g)(1), (g)(2), (g3), and (g)(4); 63.7821(f); 63.7821(g);and Subpart FFFFF Tables 1, 2, 3, 4, 5, and 6.)*

- New or revised THC and HCl and associated monitoring, reporting, and recordkeeping requirements standards for blast furnace primary control devices; (*See amendments to 40 CFR 63 Subpart FFFFF, including but not limited to 40 CFR §§ 63.7783(g), (g)(1), (g)(2), (g3), and (g)(4);63.7821(f); 63,7821(g); and Subpart FFFFF Tables 1, 2, 3, 4, 5, and 6.)*

- New work practice standards and modified monitoring, reporting and recordkeeping requirements for blast furnaces and basic oxygen process furnace (BOPF) shops; *See amendments to 40 CFR 63 Subpart FFFFF, including but not*

limited to 40 CFR §§ 63.7793(a), 63.7793(b), (b)(1), (b)(2), and (b)(3); 63.7793(c), (c)(1), and (c)(2); 63.7793(d), (d)(1), and (d)(2); 63.7793(e), (e)(1), and (e)(2); and 63.7793(f), including (f)(1) through (f)(8);

- New fenceline monitoring, reporting and recordkeeping requirements for total chromium (Cr), including requirements for root cause analyses and purported corrective actions at integrated iron and steel facilities. *See amendments to 40 CFR 63 Subpart FFFFF, including but not limited to 40 CFR §§ 63.7792; 63.7841(h); and 63.7842(f)).*

A two-year Presidential Exemption for these requirements is in the national security interest because it is necessary and appropriate to prevent irreparable harm to the domestic steel industry, which is vital to national security, and is supported for the reasons below.

BACKGROUND

In CAA § 112(i)(4), Congress gave exclusive authority to the President to "exempt any stationary source from compliance with any standard or limitation under this section [Clean Air Act Section 112] for a period of not more than 2 years if the President determines that the technology to implement such standard is not available and that it is in the national security, which includes economic security,[4] interests of the United States to do so. An exemption under this paragraph may be extended for 1 or more additional periods, each period not to exceed 2 years. The President shall report to Congress with respect to each exemption (or extension thereof) made under this paragraph." While the provision has very little precedent in being exercised, if there were ever a time to exercise such authority, the time to do so is now with respect to the IIS RTR Rule as the IIS RTR Rule, without such an exemption and if left in place, would result in materially adverse consequences on U. S. Steel and domestic steel industry. These consequences would significantly and harmfully alter domestic steel production as well as the United States' infrastructure, investments and economic security landscape which as the current and prior administrations have determined the domestic steel industry is a key, vital component.

While the President has broad authority in issuing such exemptions and while not controlling to issuing Presidential Exemptions, we note that in implementing extensions under Clean Air Act Section 112(i)(3)(B), EPA has broadly construed "standards" to include compliance measures. (See 66 Fed. Reg. 16318, 16328 (Mar. 23, 2001) Such "other compliance measures" include, among other things, "… obtaining or implementing technology hardware or software systems and process changes to accommodate pollution prevention or other emission reduction measures." *Id.*

It is significant to note that in 2020, EPA conducted a residual risk and technology review for the II&S source category. 85 Fed. Reg. 42,074 (July 13, 2020). There, EPA concluded that "risks due to emissions of air toxics from this source category are acceptable and that the current

[4] *See* America First Investment Policy, https://www.whitehouse.gov/presidential-actions/2025/02/america-first-investment-policy/ (Feb. 21, 2025) ("Economic security is national security.")

NESHAP provides an ample margin of safety to protect public health." *Id.* Further, "[u]nder the technology review, we found no developments in practices, processes, or control technologies that necessitate revision of the standards." *Id.*

Just three years later, without identifying any error in the original 2003 rule or 2020 residual risk and technology review, and while affirming the risks are acceptable and provide and ample margin of safety, EPA inexplicably proposed a raft of revisions, purportedly to "complete the required CAA section 112(d)(6) technology review promulgated on July 13, 2020." 88 Fed. Reg. 49,402 (July 31, 2023). EPA asserted that several amendments were necessary due to a broad overarching interpretation of the D.C. Circuit's decision in *Louisiana Environmental Action Network v. EPA*, 955 F.3d 1088 (D.C. Cir. 2020) ("*LEAN*"). It also proposed several revisions to existing standards, purportedly to "improve the emissions standards for this source category based on new information regarding developments in practices, processes and control technologies" in direct contrast to what it determined in 2020.

The concerns noted herein are the subject of petitions for administrative reconsideration and stay of the IIS RTR Rule that are currently pending with EPA[5] as well as petitions for judicial review with the United States Court of Appeals for the District of Columbia Circuit. We are pleased that EPA granted reconsideration and a 90-day administrative stay of the rule, but a two-year Presidential Exemption is necessary to prevent irreparable harm to the domestic steel industry while EPA reconsiders the IIS RTR Rule and proceeds with any necessary rule changes. Granting the Presidential Exemption is in the interest of national security as it is critical to prevent disruption of the domestic steel industry and the critical supply chain; and is appropriate while EPA reconsiders the IIS RTR Rule.

TECHNOLOGY IS UNAVAILABLE

A. Planned Bleeder Valve Openings (40 CFR §§ 63.7821(i); 63.7823(f), (f)(1) and(f)(2); Subpart FFFF Table 1 (16), Table 2 (16), and Table 3 (16))

The rule imposes an 8% opacity limit on planned bleeder openings and a requirement that all planned bleeder openings be monitored. 40 CFR 63. § 7821(i). These requirements are arbitrary and capricious. First, the dataset EPA used does not support an 8% opacity limit. EPA's own data suggests that the limit should be higher. EPA's dataset also does not capture variability in actual performance of both large and small furnaces. Significantly, the data does not establish a limit with which the best-performing sources have or can consistently comply. Furthermore, there is no known technology that would ensure that sources can consistently comply with an opacity limit for planned bleeder valve openings; nor has EPA identified any such technology or work practice. Therefore, if the requirement remains, sources with planned

[5] *See* U. S. Steel Petition for Reconsideration and of the National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities, EPA-HQ-OAR-2002-0083, 89 Fed. Reg. 23,294 (April 3, 2024), dated June 3, 2024; and Cleveland-Cliffs, Inc. Petition for Reconsideration and Request for Administrative Stay of the National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review, 89 Fed. Reg. 23294 (April 3, 2024) dated June 3, 2024.

bleeders with opacity exceeding 8% are either forced to incur potential significant penalties or shutdown.

Second, the Method 9 testing requirements are not possible over every operating scenario. While called "planned" bleeder openings, EPA has defined this term to include any opening that is performed by an operator. 89 Fed. Reg. at 23,298. A planned bleeder opening can therefore occur at any time without any real notice, even to the operator who initiates it. There are times an operator must immediately initiate furnace curtailment procedures to prevent catastrophic injury to personnel or damage to equipment, resulting in a bleeder opening which meets the definition of "planned," but provides no opportunity for a trained observer to begin collecting valid compliance data. As a result, reading each planned bleeder opening would require having a reader onsite, in position, and available at any time and even then, depending on the timing and daylight, etc, the observation may not be able to be made. In addition, such a requirement poses significant safety concerns as to needing an observer in a specific area to meet the Method 9 requirements.

EPA has not shown that it is a requirement necessary to control HAP emissions; nor has it identified any technology that would ensure the limit could be consistently met and that required observations of the event could be made on a moment's notice.

B. Bell Leaks - (40 CFR §§ 63.7793(c), (c)(1), and (c)(2); 63.7793(d), (d)(1), and (d)(2); 63.7800(b)(8); 63.7821(k),(k)(1) and (k)(2); 63.7821(l); 63.7823(h)(1)-(2); 63.7833(j), (j)(1) and (j)(2); and 63.7842(d)

Large Bells

The visible emission observation requirements for large bells are unclear and inconsistent. In addition, the IIS RTR Rule includes monitoring provisions for large bells that were not part of the proposed IIS RTR rule nor are they a logical outgrowth from the proposed rule as they are not logical in any case. In addition, in the IIS RTR Rule, EPA assumes that a reader will know when the large bell is open, which is not observable from where a Method 9 reader will need to be positioned. Further, there is no way to correlate the large bell seal to relief valve emissions due to the physical construction of the furnace. The conditions compromise the integrity of the data collected and would yield results that are not compliant with Method 9 because the source of any opacity cannot necessarily be identified with specificity and Method 9 requires such specificity and it requires that no more than one plume be read at a time. Furthermore, the IIS RTR Rule arbitrarily requires sources to "repair or replace" the bell seal within 4 months if the "average of 3 instantaneous visible emission readings" exceeds 20 percent. EPA has not provided any basis for this "repair or replace" requirement based upon the presence of emissions. Occasional visible emissions from the inter relief valve or large bell is not necessarily an indication that any corrective action is necessary; nor is it an indication that the bell needs to be replaced. There is no technology (or work practice) that can consistently ensure that emissions from an interbell relief valve will not occur or ensure that three instantaneous visible emission readings taken while the interbell relief valve is exhausting are under 20%; nor is there a technology or practice available to read the furnace tops to the specificity required. The IIS RTR Rule would require unnecessary down time; and would arbitrarily require repairs or replacements

for large bells that are not in need of repair or replacement; and has the potential to require some large bells to be replaced every four months even if the bell is in good, proper condition.

Small Bells

For small bells, EPA is effectively imposing a zero-opacity limit, through which corrective action is required when any visible emissions are observed. This is unsupported by data and inconsistent with the Clean Air Act.

First, there is no direct way to distinguish any opacity from the small bell seal from opacity originating from the blast furnace top from other sources and activities. This includes material from skip cars charging the blast furnace and/or material buildup when the small bell is open for the material to feed into the blast furnace. Any readings would be partly based on assumptions. U. S. Steel is not aware of any technology or methodology that would enable such a distinction.

Second, there is no substantive evidence that small bells have visible emissions only if there is improper operation or a need for maintenance. Even more inexplicably, the IIS RTR Rule appears to be based on the assumption that there is a direct correlation between time or metal throughput and emissions. EPA cites no data or documentation to support this conclusion and U. S. Steel is aware of none. Emissions from the small bell are not strictly correlated with metal throughput. New bells with low throughput can on occasion have visible emissions. Other bells can operate for an extended period of time and metal throughput without visible emissions. There is no metal throughput value that U. S. Steel can specify with certainty that has been proven and documented to produce no opacity from the small bell on its double-bell furnaces. Requiring new "metal throughput limits" every time any opacity is observed results in unnecessarily shortening the use of small bells and could result in very small values. This could result in having a short bell throughput of only a few thousand tons if visible emissions are observed after a short period of time. There is no technology available that can ensure that even a new small bell consistently will not result in any visible emissions.

C. Beaching (40 CFR §§ 63.7783(g)(3); and 63.7793(e), (e)(1), and (e)(2)); and as incorporated as applied into 40 CFR Subpart FFFFF Table 4

EPA has not justified the enclosure and work practice requirements in the IIS RTR Rule. EPA has not shown in the record that the beaching requirements are "the average emission limitation achieved" by these sources. 42 U.S.C. § 7412(d)(3). The IIS RTR Rule imposes overly prescriptive requirements for beaching; and EPA inexplicably disregarded comments suggesting alternative work practices. EPA has not shown how its prescriptive requirements, including carbon dioxide shielding and/or full or partial enclosure, comply with the Clean Air Act. By EPA's own interpretation, because of the relative infrequency and short durations associated with it, and EPA's determination that the risks provide an ample margin of safety, spending millions of dollars with no meaningful improvement is not justified.

Even accepting that partial enclosure, CO_2 shielding, and work practices can reduce emissions from beaching, EPA must show more than that before forcing industry to uniformly adopt those controls and practices as a MACT requirement. Even under EPA's reading of the Clean Air Act, which U. S. Steel disagrees with, EPA must show that the requirements it is imposing are the "emission control that is achieved in practice by the best controlled similar source." 42 U.S.C. § 7412(d)(3). EPA has no record basis for finding that the requirements in the Rule meet this requirement.

D. Slag Handling and Processing (40 CFR §§ 63.7783(g); 7821(j); 63.7823(g), (g)(1), and (g)(2); Subpart FFFFF Table 1 (17); Table 2(17); Table 3 (17); and Table 4.

In the IIS RTR Rule, EPA imposes a 10% opacity limit on slag processing, handling and storage based on what it claims is a "straight average of the top five performing facilities." 89 Fed. Reg. at 23,301. First, it is important to note that when promulgating the Iron and Steel MACT in 2003, EPA was aware of slag handling and processing but determined it was not appropriate to impose any Federal standards. In the 2003 and 2020 IIS MACT rules, EPA did not include slag handling, processing and storage as part of the source category. In promulgating the IIS RTR Rule, EPA inconsistently describes slag processing, handling and storage activities, creating both material ambiguities in the IIS RTR Rule requirements and an inadequate record basis for the IIS RTR Rule's requirements. Furthermore, EPA's determination of setting a 10% opacity limit is not supported by the data; and is inconsistent with EPA' own UPL methodology to develop limits. (Without any sound basis, EPA simply asserted that the UPL approach is not appropriate.)

In requesting data from sources, EPA requested that the sources conduct Method 9 readings from "each operating piece of equipment handing slag" and "each of the following: slag dumping to a pile, digging from a pile, and dumping to stationary equipment." *See* Information Collection Request to U. S. Steel, Enclosure 2, EPA-HQ-OAR-2002-0083-1337-attachment 3, at Table 2. EPA knew at the time that this was only a subset of the slag processing, handling, and storage activities that can lead to visible emissions. As noted in the information request, "[p]rocessing operations include, but are not limited to, crushing, grinding, screening, and sizing. Handling and storage events include, but are not limited to: slag flowing in the runners; slag dropping into a slag container (if applicable); slag dropping into the pit; slag flowing and cooling in the pit; end-loader digging and dumping; in-plant truck dumping; use of conveyors, stackers, and reclaimers; storage piles; and loadout for shipping slag offsite, if applicable." *Id.* at 2, n.1.

The IIS RTR Rule, however, EPA requires that initial compliance be demonstrated by conducting Method 9 readings at a different list of activities, including "slag dumping to BF pit, BOPF slag dumping to pit, BF pit digging, BOPF pit digging, slag dumping to a pile, slag dumping to a piece of slag handling equipment such as crusher." 89 Fed. Reg. at 23,324-25. Subsequent performance tests are then to be conducted on "BF pit filling; BOPF slag pit filling; BF pit digging; BOPF slag pit digging; and one slag handling (either truck loading or dumping slag to slag piles)." *Id.* at 23,324. It is not clear if EPA intended any distinction between the list of activities to be monitored for initial and subsequent testing. For example, it is unclear whether "dumping to" a "BF pit" is meant to be the same as "BF pit filling." None of these terms are defined in the Rule and they are not commonly used in the industry, leaving operators with no

clear guidance as to what activities EPA is even trying to require be read. But it is equally clear that these activities are not the same as those for which EPA collected data. EPA cannot claim that its opacity limits are reasonably based on the record when the record has no relevant data.

The IIS RTR Rule slag handling and processing requirements present an additional problem by requiring Method 9 observations "at each" listed step in the processing, handling and storage of slag. *See* 89 Fed. Reg. at 23,324-25. This presents not only an unduly burdensome monitoring requirement, but in some cases, it will present a safety hazard to Method 9 readers and requires monitoring that is, at best, impractical or, at times, simply impossible. Even if a reader could be positioned despite the risk, the readings would not be reliable given the lack of contrast necessary to make valid Method 9 readings.

Many of the IIS RTR Rule slag handing and processing requirements are inconsistent, impractical and impossible. For this reason, U. S. Steel has significant concerns on whether it can compliantly implement such requirements. Furthermore, the IIS RTR Rule opacity limits for slag handling were not properly determined – as EPA did not collect any opacity data for some operations - and it is not clear if a technology is available to ensure the IIS RTR Rule slag handling and processing requirements, including the opacity limits, can consistently be met. If EPA intends to regulate slag handling and processing with opacity limits, a significant departure from the original IIS MACT Rule promulgated in 2003, EPA must determine such limits with valid data and in a manner consistent with the Clean Air Act.

E. Unplanned Bleeder Openings (40 CFR §§ 63.7783(g)(3); 63.7793(b), (b)(1), (b)(2), and (b)(3); 63.7841(b)(14), (b)(14)(i), (b)(14)(ii), and (b)(14)(iii); Subpart FFFFF Table 1 (7)(e), (8)(e); Table 2 (7)(e), (8)(e); Table 3 (7)(f), (8(f)); and Table 4.

The Rule limits the number of unplanned bleeder valve openings in a given year. 89 Fed. Reg. at 23,333. While there are certain furnace-specific work practices that can be employed to minimize the *risks* of occurrences of unplanned bleeder openings, work practices cannot be used to eliminate or reduce unplanned bleeder valve openings to a specific value. Placing a "limit" on unplanned bleeder valves itself is not a "work practice." In placing a limit to unplanned bleeders, EPA is pitting environmental against safety risks. This is problematic because the steel industry has acknowledged that the valves must be able to open "to mitigate safety issues."

EPA's expectations are also based on a misstatement of the cause of unplanned bleeder openings, insufficient data, and improper use of the limited data EPA chose to use. First, EPA's response to comments makes clear that EPA's expectation is based on the assumption that unplanned bleeder valve openings arise only from large burden slips, and thus can be managed by attentive material management, monitoring of stockline descent, and timely "checking" of the furnace. As U. S. Steel pointed out in comments, and again in our petition for reconsideration, by placing a hard limit on the number of unplanned bleeder openings, EPA's actions are not consistent with the real-world operating experiences of industry. Unexpected pressure buildup can occur for several reasons. Burden hanging in the furnace is one possibility, but it is not the only cause. For example, pressure can increase rapidly, simply because a new pathway has opened in the burden that rapidly changes the upward flow of gas. In placing a hard limit, EPA does not appear to understand the multitude of potential causes for unplanned bleeder openings.

Second, even with respect to burden hangs, EPAs required purported "work practices" will not necessarily prevent or reduce unplanned bleeder openings. When the burden hangs, a stockline monitor alarm could sound to warn the operators that a problem has occurred, but checking the furnace at that time is not likely to address the problem as it most likely will be too late to prevent the occurrence. Further, stockline monitoring will provide no warning of other causes. Third, EPA's asserted connection between the number of unplanned bleeder openings and the mass of HAP emitted is arbitrary and capricious. It is largely based on unwarranted assumptions and oversimplifications that imply a relationship for which there is none

Finally, the timeline for implementing screening is not justified or sufficient. The Rule provides 2 years in which to implement unplanned bleeder valve requirements. 89 Fed. Reg. at 23,320. Additional screening will require permitting and purchasing equipment which cannot be guaranteed to be completed within 2 years. In some cases, a new screening area may need to be designed into the existing footprint. This may not be technically feasible, but if required, the work will easily exceed two years.

In sum, while it is true that some practices can assist in reducing the risks for the occurrences of certain unplanned bleeder events, which U. S. Steel currently employs, the technology to ensure that unplanned bleeder events do not exceed a set number is not available. If a blast furnace reaches the limit of such events, the source would be left with a Hobson's choice of shutting down to void exceeding the "limit" and potential associated penalties or continue to operate knowing that it will be in violation the next time an unplanned bleeder event occurs.

F. IIS RTR Rule New HAP Limits for sinter plants, blast furnaces and basic oxygen furnaces (40 CFR §§ 63.7783(g), (g)(1) and (g)(2); and as provided in 40 CFR 63 Subparts FFFFF Tables 1, 2, 3, 4, 5 and 6)

The IIS RTR Rule includes several new MACT standards covering multiple hazardous air pollutants (HAP). However, the technology to control these HAP at these sources is not available because no such technology has been demonstrated to control and meet the IIS RTR HAP limits for the integrated iron and steel industry, either in the US or internationally.

A Presidential Exemption is warranted for several reasons:

- No technologies employed at any sinter plant, blast furnace or basic oxygen furnace have demonstrated the ability to meet the new MACT standards. No integrated iron and steel facility has installed such controls for the new HAPs; nor are the facilities subject to any existing limits for the new HAPs. EPA's approach to completing the RTR and purported "gap filling" pursuant to the *LEAN* decision are contrary to a plain reading of the Clean Air Act and are due no deference.

- Contrary to the Clean Air Act, the IIS RTR Rule imposes requirements that no source, domestically or globally, is known to *actually achieve*.

- The new HAP limits were erroneously determined, as more fully explained in U. S. Steel's comments to the proposed IIS RTR rule and in our petition for reconsideration. For example, EPA ignored data with no justified basis when determining the MACT floor. EPA's excuse that it did not have time to consider the data is not sufficient; and is inconsistent with the Clean Air Act and legal precedent. Because the IIS RTR Rule is based upon insufficient data, attempts to continuously comply with the new limits will require the addition of controls. Furthermore, even with the installation of and operation of additional controls, continuous compliance with the new limits remains uncertain because no technology has demonstrated that it is able to continuously achieve such standards. The estimated cost effectiveness of controls for the integrated iron and steel industry would be unprecedented and exorbitant. Because the new limits are not based upon proven technologies as Congress intended and as EPA has historically done to comply with Section 112 of the Clean Air Act, U. S. Steel must incur substantial unrecoverable costs in its attempt to design and implement controls that will attempt to consistently meet the new limits in an impossible time period resulting in irreparable harm to U. S. Steel. Data in EPA's possession suggests that continuous compliance cannot be met without modifications at integrated iron and steel facilities; and there is no technology that has demonstrated the ability to consistently meet the limits.

- U. S. Steel's integrated iron and steel facilities need to generate additional data to better account for raw material and process variability and to determine technology feasibility. The MACT floor datasets are too limited, are not representative of the integrated iron and steel industry, and do not adequately reflect variability in operating conditions. As a result, no technology is available that has demonstrated that the new limits are achievable under all reasonably foreseeable conditions.

- Controlling multiple pollutants and retrofitting controls into existing equipment and operations adds complexity and time due to interactions of the requirements for control, including pollutant interactions, flow rates, chemistry, and temperatures.

- Any additional controls would require permitting, which takes 6-12 months - and sometimes longer - after engineering is completed.

- Contrary to the Clean Air Act and EPAs obligations, EPA failed to consider the IIS RTR Rule's impacts to the domestic integrated iron and steel industry and the nation's economic security and national growth interests.

- EPA relied on fewer than five sources for its MACT "pool" as required by Clean Air Act, Section 112(d)(3). EPA's failure was specifically acknowledged by Judge Walker in his dissenting option to the U. S. Court of Appeals for the District of Columbia Circuit's order denying U. S. Steel's motion to stay the effectiveness of the rule. Judge Walker recognized that the IIS RTR Rule "likely violates the Clean Air Act by using fewer than 5 sources to set emission floors. See 42 U.S.C. § 7412(d)(3)(B). That error likely forces the applicants to incur "nonrecoverable" compliance costs during the pendency of this litigation — an irreparable harm. See Ohio v. EPA, 144 S. Ct. 2040, 2053 (2024)." Judge

Walker further explained that the IIS RTR Rule "will likely cause irreparable harm by forcing applicants ***to develop novel technology*** [emphasis added]." Thus, Judge Walker recognized that the technology to comply with the new HAPs was not available. U. S. Steel has given EPA additional data that needs to be included in any limit determination.

- The IIS RTR Rule relies on fewer than 10 data points to calculate many of the Upper Predictive Limits (UPLs) which is contrary to EPA precedent and guidance.[6]

- Many of the IIS RTR Rule new HAP limits are barely above detection limits, and therefore, the derivation of the limits as well as the ability to consistently demonstrate compliance with the new HAP limits may be compromised.

- EPA failed to appropriately consider cost impacts when promulgating the IIS RTR Rule. Furthermore, EPA incorrectly estimated costs for the controls for new HAPs, as more fully explained in our petition for reconsideration.

- Changes to the sinter plants, blast furnaces and basic oxygen furnaces would require several plant outages, affecting the sources' abilities to produce steel.

- Limited available physical space within the areas of the sinter plants, blast furnaces and basic oxygen furnaces add complexity and time to all related construction and may be infeasible altogether.

- Adding controls to existing controls on existing equipment involves unique engineering challenges compared to installing controls when a facility is being constructed.

- EPA failed to appropriately address start-up, shutdown and malfunction (SSM) events in setting the MACT limits and requirements. U. S. Steel believes a work practice requirement in lieu of hard limits is appropriate to account for SSM events.

- EPA failed to address specific concerns and data submitted by U. S. Steel and other commenters showing that no integrated iron and steel facility is actually meeting all of the HAP limits; nor does any IIS facility employ technology that demonstrates the limits can consistently be met. Furthermore, no technology exists that has demonstrated that the limits can consistently be met.

Unfortunately, U. S. Steel's concerns as provided in comments submitted to EPA as well as those raised with the Office of Management and Budget before the IIS RTR rule was finalized were almost entirely ignored. First, during the rule development, EPA grossly underestimated the cost impacts of the rule to the domestic steel industry which is already significantly financially challenged by unfair trade practices by competitors whose operations are not subject to strict, if any, environmental standards that the United States has required for domestic integrated iron and steel facilities for decades. In addition, EPA cherry-picked data to be used in

[6] United States Environmental Protection Agency, ProUCL Version 5.1 User Guide; Statistical Software for Environmental Applications for Data Sets with and without Nondetect Observations. October 2015

the derivation of limits and requirements, and, most astonishingly, excluded valid data as the process fell short of EPA's statutory obligation and precedent in setting MACT floors.

Contrary to the plain language of the Clean Air Act and decades of precedent, EPA has turned the establishment and determination of MACT Standards under the Clean Air Act Section 112 into a research and development statute. Because technology to meet the limits is currently unavailable, U. S. Steel and other sources will need to conduct research, including bench scale testing, to determine the potential technologies that could be used to meet the limits. This research time could be extensive – therefore the three-year time frame to meet the IIS RTR Rule new limits is insufficient. Congress envisioned a three-year time frame to install controls and meet new limits because it intended that the technology would be proven and known during the rule development. This is not the case for the IIS RTR Rule. U. S. Steel needs more time to better determine process and raw material variability impacts on emissions, evaluate additional emission controls and to assess technical feasibility and to test, engineer, permit, fabricate, and install the new equipment and other controls before the date compliance is required. Additional compliance time would also be needed to retrofit new equipment into existing facilities with limited space and to allow facilities to streamline and consolidate compliance testing of sinter plants, blast furnaces, and basic oxygen furnaces; and the associated control devices at integrated iron and steel facilities with other required source testing. The Presidential Exemption is necessary to account for these factors and to prevent irreparable harm to the domestic steel industry; and is appropriate as EPA reconsiders the IIS RTR Rule.

G. New work practice standards and modified monitoring, reporting and recordkeeping requirements for blast furnaces and basic oxygen process furnace (BOPF) shops; (40 CFR §§ 63.7793(a), 63.7793(b), (b)(1), (b)(2), and (b)(3); 63.7793(c), (c)(1), and (c)(2); 63.7793(d), (d)(1), and (d)(2); 63.7793(e), (e)(1), and (e)(2); and 63.7793(f), including (f)(1) through (f)(8)

Complying with the new work practice standards and modified monitoring, reporting and recordkeeping requirements for blast furnaces and basic oxygen process furnace shops is impractical if not impossible. While not part of the *LEAN* decision, in the IIS RTR Rule, during the proposed rule stage, EPA announced a "reconsideration" of casthouse and BOPF Shop fugitive emissions standards pursuant to 42 U.S.C. § 7412(d)(6). 88 Fed. Reg. at 49,412. U. S. Steel and other commenters raised significant concerns with the proposed standards, including with EPA's authority to impose standards before finding that revisions were necessary considering new technological developments, as required by 42 U.S.C. § 7412(d)(6). EPA has not considered, let alone shown, that revised fugitive emissions requirements for casthouses and BOPF Shops are necessary. These requirements should therefore be removed from the IIS RTR Rule.

There are practical problems with conducting Method 9 readings as required by the IIS RTR Rule. Method 9 observations require several conditions, including a safe place to observe the opening and proper orientation to ensure a valid reading and avoid interference. These conditions cannot always be satisfied at the same time for all openings at a BOPF Shop and casthouse.

For example, conducting Method 9 observations from "all" openings at the BOPF shops and blast furnace casthouses present numerous challenges: safe location to observe all the potential openings, being perpendicular to the openings, and distinguishing potential overlapping plumes at each opening. EPA is making an improper assumption that just because there is an opening that there is potential for emissions from that opening. The BOP buildings and casthouses are very large and process knowledge and airflow inside the buildings can determine if an opening needs to be observed or not as U. S. Steel currently implements the monitoring required by the 2003 and 2020 IIS rules. It's unnecessary and wasteful to require multiple observers at all openings. Additionally, Method 9 does not allow for reading overlapping plumes. By treating each opening separately, the Rule does not allow for a valid Method 9 position. By nature of the design, it would be impossible to read perpendicular to the opening and not have overlapping plumes from the casthouse. The point of highest opacity should be read wherever it comes from, consistent with current Method 9 practices. U. S. Steel recognizes that this may be an error in the Rule language, as the Preamble to the Rule states that EPA's intent was to require monitoring "from all openings, or from the one opening known to have the highest opacity." 89 Fed. Reg. At 23,305-06. The preamble language is consistent with how the 2003 and 2020 visible emissions monitoring was conducted; and how U. S. Steel intends to implement the IIS RTR Rule, but the IIS RTR Rule language – if strictly applied – is impossible as there is no technology or methodology to implement the monitoring consistent with a strict application of the IIS RTR Rule for the reasons expressed above.

H. Fenceline Monitoring (40 CFR §§ 63.7792; 63.7841(h); and 63.7842(f))

The fenceline monitoring requirements are infeasible and unhelpful. The IIS RTR Rule specifically recognizes that the technology to implement the fenceline monitoring is not yet available. It is also significant to note that the EPA has asserted that the authority to implement the fenceline monitoring requirements are based upon an improper and unprecedented application of Section 114 of the Clean Air Act. U. S. Steel and other commenters raised significant concerns with even being on notice as to what EPA had proposed, noting that the methodology and technology to implement is unknown and the methodology impacts almost every important aspect of the program, from its feasibility to its basic requirements, such as the number and location of monitors to the sampling duration, action levels, and time periods in which parties must take, interpret, and respond to results. EPA acknowledges the fenceline monitoring method for metals has not yet been proposed or promulgated. (See EPA's response to comments at 159.) EPA stated that it needs to "further investigate and revise these approaches for a stationary source regulatory program to ensure improved precision and accuracy in the method" and stating that "EPA is evaluating alternative approaches/methods for metals sampling at the fenceline and when the EPA can validate these method(s) we will move forward with notice and comment rulemaking to formally propose their use."). Yet, despite all the uncertainties in the yet-to-be determined method, the Rule includes a detailed program for performing fenceline monitoring for chromium, including the very details, such as number of monitors, sampling frequency, sampling duration, action level, and sunset provisions, that will necessarily depend on a new methodology that may differ from the methods facilities employed for the 6-month data collection during the ICR. 89 Fed. Reg. at 23,308. This puts the cart far in front of the horse.

EPA appears to acknowledge this flaw. *See EPA's Response to Comments on the IIS RTR Rule on page* 158 (recognizing that the monitoring method and Rule will require notice and comment rulemaking to incorporate the method). But U. S. Steel is troubled by EPA's decision to, in the absence of a method, "stipulate[] the number of monitors, the frequency and duration of sampling in the rule." *Id.* EPA must base its decision on the record. *State Farm*, 463 U.S. at 43. EPA cites no authority to "stipulate" to facts that are not in the record and EPA's assertion that it can stipulate to the central facts of a monitoring program before it has a methodology that will support those facts is inconsistent with 42 U.S.C. § 7607(d)(6)(C), which provides that "[t]he promulgated rule may not be based (in part or whole) on any information or data which has not been placed in the docket as of the date of such promulgation."

What will each monitor cost? How accurate will it be? How long will it take to get results? U. S. Steel lacks the information to answer these questions. EPA does not yet know the answers either, and the Clean Air Act and APA do not permit it to guess. Indeed, EPA's acknowledgement that the method will need to undergo public notice and comment is a recognition that the final form of the method cannot be known. Nor, to U. S. Steel's knowledge, has the technology for monitoring chromium undergone assessment through the U.S. Environmental Technology Verification program, which is intended to provide key information on relative accuracy, precision, bias, drift, and detection limits. Without this type of assessment, any newly proposed or implemented method for chromium monitoring will not have qualified data to support fenceline measurement results for the intended use. Having already recognized that it does not yet have a sampling method for fenceline monitoring, and without even the data needed to propose a potential methodology, EPA cannot now finalize a fenceline monitoring requirement.

The monitoring methodology inherently affects the results, making any conclusions based upon past data generated with other methods suspect and unreliable. Different methods frequently have different interferences and factors unique to the method. The fenceline monitoring methods, including the action levels, root cause analyses and corrective actions cannot be determined until the technology becomes available regarding the test method and data generated using the test method.

It is also significant to note that EPA has made no nexus between the monitored parameter, chromium, and the action level. The action level bears no relationship to the Occupational Health and Safety Administration's (OSHA's) Permissible Exposure Limit (PEL) for CR^{6+}, which is 50 times higher at 5 µg/m3 and, being based on a single six-month dataset from a single facility, it reflects no consideration of seasonal or annual variability, let alone differences in II&S facilities, which vary greatly in location, age, configuration, processes, alloys, products footprints, and weather patterns.

In sum, a two-year Presidential Exemption is necessary and appropriate for the IIS RTR Rule fenceline monitoring requirements because, as EPA acknowledges, the technology to implement the IIS RTR Rule fenceline monitoring requirements has not yet been determined. The IIS RTR Rule language to not require the monitoring until one year after a method is codified is insufficient to address the concerns identified above, namely the fact that no data is currently available using the yet-to-be codified method to determine if EPA's action level is

otherwise appropriate, noting, too, that EPA has failed to provide any reasonable basis or nexus to the Cr action level in the IIS RTR Rule.

THE EXEMPTION IS IN THE INTEREST OF NATIONAL SECURITY

A. U. S. Steel's Integrated Iron and Steel Facilities are Vital to the Production of Steel at U. S. Steel

U. S. Steel's integrated iron and steel facilities are key and essential operations of U. S. Steel; and are critical for U. S. Steel to produce steel. The facilities have a tremendous impact on the local, regional, and national economy. The facilities employ several thousands of highly skilled United Steelworkers union-represented and non-represented employees. In addition, these integrated operations have a multiplier effect in supporting thousands of additional steel, maintenance, construction, energy, transportation, and supplier jobs, not only in the regions in which they are located, but also across the United States.

B. U.S. Steel Contributes to the Economic Security of the United States, and Economic Security is National Security

U. S. Steel is a leading steel manufacturer in the United States and Europe. U. S. Steel has over 22,000 dedicated employees and produces over 1,000 grades of steel. For more than 100 years, while consistently meeting new challenges, U. S. Steel has been a vital part of America's history, economy, and infrastructure. U. S. Steel's operations located throughout the United States include, among others, coke production, taconite production and integrated iron and steel production, which contribute to the U.S. economy and key industries.

Continued domestic production, including the production by U.S. Steel, is critical to national infrastructure investments and national economic growth. The domestic steel industry is responsible for over $520 billion in economic output, supporting over 2 million jobs. It generates over $56 billion in tax revenues annually. U. S. Steel specifically supplies steel to the U.S. transportation and automotive sectors, including major U.S. automakers; the construction sector; containers and packaging sector; appliances and electrical equipment sector; and oil, gas, and petrochemicals sector. For these industries – which are critical to U.S. economic security –U. S. Steel provides high quality domestically produced steel. U. S. Steel is also a major contributor to the communities in which it operates – including, among others, in Alabama, Arkansas, Pennsylvania, Indiana, Illinois, Minnesota, and Michigan – directly and indirectly supporting jobs and economic growth, which underpin the United States' economic security. As stated in the President's America First Investment Policy, "economic security is national security." Consistent with this, the Federal government has determined that the steel industry is "critical to minimum operations of the *economy* and *government*."[7]

In the case of steel, the history of U.S. Government actions to ensure the continued viability of the domestic steel industry demonstrates that, across decades and Administrations,

---

[7] Department of Commerce, Bureau of Export Administration; *The Effect of Imports of Iron Ore and Semi-Finished Steel on the National Security*, October 2001

there has been consensus that domestic steel production is vital to our national interest. The overall security of the nation is dependent upon a strong economy and investments in industry and infrastructure. All of these goals are supported by the steel industry, and it needs to have protection from the proposed rules until such time as a proper review can take place.

The unprecedented and exorbitant costs that U. S. Steel would need to incur to attempt to comply with the IIS RTR Rule would risk U. S. Steel losing viable commercial production capabilities and will jeopardize the domestic industry's ability to meet the full spectrum of infrastructure and investment needs. Ensuring that U. S. Steel and other steel producers are able to continue to produce steel in the market for U.S. commercial and infrastructure needs is necessary to grow the U. S. market and economy.

The IIS RTR Rule, as well as the other rules affecting the domestic steel industry, will result in unprecedented costs which will jeopardize the long-term operations of U. S. Steel (and other steel producers.) If U. S. Steel is not financially viable to invest in the latest technologies, facilities, and long-term research and development, nor retain skilled workers while attracting a next-generation workforce, it will be unable to support the nation's infrastructure, economy and commercial needs.

C. Cumulative Burden

In 2024, EPA promulgated three new steel sector rules[8] resulting in dozens of new emission limits and work practices materially impacting the domestic iron and steel critical operations in the United States. A Presidential Exemption is necessary to prevent significant direct adverse impacts and irreparable harm to domestic steel production and infrastructure.

The promulgation of these three rules, simultaneously with other recent significant EPA actions, including most notably, the lowering of the PM2.5 NAAQS and the adoption of the overreaching Good Neighbor Rule, harm the competitiveness of the domestic steel industry and jeopardizes the domestic steel industry's ability to support the economy, growth and critical needs of the nation. These rules, individually and collectively, result in marginal, if any, benefits, yet result in unprecedented capital expenditures of billions of dollars for the domestic steel industry. These draconian, job-killing, unlawful rules were promulgated notwithstanding that EPA determined that the existing MACT regulations provide acceptable risks with an ample margin of safety.

---

[8] The three rules at issue are:

1) National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-EPA-OAR-2002-0083), April 3, 2024, *Federal Register*, (89 Fed. Reg. 23294)
2) National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries. (EPA–HQ–OAR–2002–0085 and EPA– HQ–OAR–2003–0051), July 5, 2024, *Federal Register*, (89 Fed. Reg. 55684); and
3) National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments (EPA-HQ-OAR-2017-0664), March 6, 2024, *Federal Register*, (89 Fed. Reg. 16408).

In addition, it is significant to note that in 2020 EPA previously completed its statutory obligation to determine risks and to review technological developments for the taconite and integrated iron and steel categories and determined that no significant revisions to these rules were necessary. However, in 2024, EPA unilaterally reversed course and mandated that the industry comply with dozens of new limits and requirements that will require hundreds of millions if not billions in capital expenditures – and even then – compliance with some of the new limits cannot be assured as the limits are based upon insufficient data and are based upon unproven, untested technologies for the limits imposed. If left in place, the domestic steel industry may be left to choose between prematurely shuttering mills, resulting in job losses and irreparable harm to their local communities, or making huge investments to develop technologies that have no proven application in the steel sector. In short, these rules stand to paralyze an industry that currently leads the world in the pathway to clean steel production. These rules, if left in place, would further skew the market to the benefit of foreign manufacturers and state-owned enterprises – in particular, Chinese state-owned steel producers, which dominate the global steel industry – and which are held to less stringent environmental standards.

Without a Presidential Exemption, the IIS RTR Rule would create significant, unprecedented burdens for domestic steel industry and manufacturers and negatively impact the workforce, who are a vital part of the U.S. economy. In addition, the IIS RTR Rule would substantially raise costs to consumers across the country and would likely cause harm to the domestic economy and supply of materials for infrastructure and growth.

The importance of avoiding these harms to the coke and steel industry is emphasized in a December 6, 2023 letter from eight U.S. Senators – including then-Senator JD Vance – to EPA warning that the Coke Ovens Rule and two other rules aimed at the steel sectors "… would dramatically undermine the domestic steel industry and national security while driving production overseas likely resulting in no net reduction in emissions from the steel industry globally."[9]

Likewise, in a June 14, 2024, letter six U.S. Senators – again including then-Senator Vance – urged EPA to reconsider the Coke Ovens Rule and two other rules aimed at the steel industry, warning that "… the steel industry will be forced to proceed with planning and spending for unproven technologies and work practices while the final provisions of the rules remain uncertain. Given that these regulations will impact nearly every aspect of the integrated iron and steelmaking process, it is imperative that EPA grant both the petitions for reconsideration and requests for stay of the rules."[10] Similar concerns were raised in a letter to EPA from Congress Members Crawford and Mrvan of the Congressional Steel Caucus.[11]

Without a Presidential Exemption, the IIS RTR Rule would require immediate actions by U. S. Steel that unfairly burden U. S. Steel, impose actions that are either unsafe, unlawful,

---

[9] Letter from U.S. Senators Vance, Brown, Braun, Manchin, Casey, Klobuchar, Capito, and Young to Administrator Regan, p. 1 (Dec. 6, 2023) (Att. A).
[10] Letter from U.S. Senators Vance, Brown, Braun, Casey, Klobuchar, and Young to Administrator Regan, p. 2 (June 14, 2024) (Att. B).
[11] Letter from Congressmen Crawford and Mrvan to Administrator Regan, p. 1 (Dec. 18, 2023) (Att. C).

impossible, impractical and/or are ineffective; and require U. S. Steel to spend tens of millions if not hundreds of millions of dollars on unproven technologies, thereby impacting its ability to support the nation's growing economy, infrastructure needs, and continued thriving national investments.

CONCLUSION

Thank you for the opportunity to provide this Request for a Presidential Exemption. The bases of granting an exemption are well grounded in the facts that support a clear finding that the technologies to implement the IIS RTR Rule are not available, and because of the financial and infrastructure implications, it is in the interest of national security to grant the request. Furthermore, while not a factor specifically listed as a basis for the exemption, it is important to note that granting the request will not result in any unacceptable risks to the public or the environment as EPA has determined that the integrated iron and steel source category presents acceptable risks with an ample margin of safety with the present controls, and requirements and limits already in effect to which U. S. Steel consistently demonstrates compliance. If you have questions or need additional information, please contact Matthew DeLibero at (412) 233-1200 or Alexis Piscitelli at (219) 888-5280.

United States Senate

WASHINGTON, DC 20510

December 6, 2023

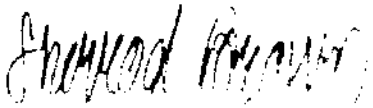
The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

We write to you today regarding the U.S. Environmental Protection Agency's (EPA) three proposed rules related to steel manufacturing and related supply chains. We have serious concerns with these proposed rules because they would dramatically undermine the domestic steel industry and national security while driving production overseas likely resulting in no net reduction in emissions from the steel industry globally. Reducing the emission of harmful air pollutants should be done based upon sound science and with proven technology that is both technically and economically feasible. The irony is that the United States' steel industry is world's cleanest major producer of steel[1]. American steel manufacturers take seriously their commitment to protecting the environment; however, rules that drive production overseas are bad for our economy, bad for national security, and bad for the environment.

These rules:

1) National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-EPA-OAR-2002-0083), 2) National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries. (EPA–HQ–OAR–2002–0085 and EPA– HQ–OAR–2003–0051), and 3) National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments (EPA-HQ-OAR-2017-0664), if finalized as proposed, would require billions of dollars in capital investments and increased annual operating costs for the U.S. steel industry.



We support reducing harmful air pollution. We also support rules that are durable, realistic, and based upon proven technology and reflect a consensus view among stakeholders on how to best improve public health while protecting good paying jobs and supporting industries essential to our national and economic security. These rules fail to meet those standards.

As you move forward with these rulemakings, we urge you to take an inclusive approach – working directly with major stakeholders in developing technically-sound final rules that achieve further emissions reductions while not harming the competitiveness of our American steel companies. Written properly, regulations can help American steel manufacturers lead the world in clean steel production. Poorly written rules undermine domestic manufacturing and promote reliance upon inputs made by foreign manufacturers – manufacturers that pollute more than their American counterparts. Regulations that cost

United States Senate

WASHINGTON, DC 20510

June 14, 2024

The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

We write to you today regarding three U.S. Environmental Protection Agency (EPA) rules that together threaten the economic competitiveness of the American integrated steel industry. We urge EPA to grant the petitions filed by the domestic integrated steel industry seeking administrative reconsiderations and stays of all three final rules until the EPA can complete a comprehensive review of each rule through the administrative reconsideration process.

Working together, EPA and industry have achieved notable reductions in environmental impacts to air, water, and land over the past 50 years. The steel industry in the U.S. is the world's cleanest major producer of steel and is already subject to more environmental regulation than its global competitors, resulting in a cleaner environment. While we appreciate EPA's efforts to address concerns raised by multiple stakeholders – including steel companies, the United Steelworkers (USW), coke producers, and numerous Members of Congress throughout the rulemaking process, we remain concerned that the final rules contain flaws that will undermine the domestic steel industry and national security while driving production overseas. We are specifically concerned about the following three rules:

- National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing (EPA-HQ-OAR-2017-0664)
- National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-OAR-2002-0083)
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries (EPA–HQ OAR 2002–0085 and EPA– HQ–OAR–2003–0051).

A failure to get these regulations right will not only have a negative impact on domestic steel production and American steelworkers, but it will also likely fail to achieve a net reduction in emissions from the steel industry globally. In fact, emissions will likely rise as production moves to countries, like China, with far less stringent rules and regulations. By granting the requested administrative reconsideration and stay of the rules, the EPA and industry can build on their shared track record of success and continue to work together in a constructive manner to achieve durable rules that both protect the environment and our domestic integrated steel industry.

Throughout the rulemaking process, EPA worked to address technical and analytical flaws with these rules raised by multiple stakeholders. The modifications incorporated into the final rules in response to stakeholder feedback were important steps in the right direction, but we remain concerned they did not go far enough in addressing fundamental flaws with the rules. Further modifications are needed to address new information provided to EPA by stakeholders to ensure the rules are achievable by the industry, as required by the Clean Air Act, and that the regulations do not induce unintended consequences, such as loss of domestic steelmaking capacity and jobs. Given all that is at stake in terms of our country's advanced steel manufacturing capabilities and the good-paying, middle class union jobs the steel industry sustains, it is critically important that these rules are technically and economically feasible and do not undermine the competitiveness of the industry.

A stay of these rules will allow EPA to continue to work with industry stakeholders, including domestic companies and the USW, to obtain a complete and thorough understanding of the new information, equipment, and processes and ensure regulations moving forward are sound policy. Absent a stay, the steel industry will be forced to proceed with planning and spending for unproven technologies and work practices while the final provisions of the rules remain uncertain. Given that these regulations will impact nearly every aspect of the integrated iron and steelmaking process, it is imperative that EPA grant both the petitions for reconsideration and requests for stay of the rules.

We urge EPA to grant the industry's petitions for reconsideration and stay requests to ensure that these regulations both safeguard our environment and preserve production capacity and jobs in our strategically important integrated iron and steel sector. Thank you for your work to date with us on these important matters.

ATTACHMENT C

Congress of the United States
House of Representatives
Washington, DC 20515

December 18, 2023

The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

As Chairman and Vice Chairman of the Congressional Steel Caucus, we write to express our concerns regarding the proposed rules below from the U.S. Environmental Protection Agency (EPA):

- National Emission Standards for Hazardous Air Pollutants: National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments (EPA-HQ-OAR-2017-0664)
- Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-EPA-OAR-2002-0083)
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries (EPA–HQ–OAR–2002–0085 and EPA–HQ–OAR–2003–0051).

The American steel industry and its manufacturing workforce produces the world's cleanest steel, made possible by years of substantial investments into climate initiatives. According to the American Iron and Steel Institute, the steel industry has reduced its energy intensity per ton of production by 35 percent and carbon dioxide emissions intensity by 37 percent in the past three decades. We also would highlight that these efforts will continue to be augmented by research and technology investments being made under current law.

We are grateful for your efforts to assist in the implementation of these laws and want to ensure that the proposed rules do not hinder the ability of the American steel industry to make robust investments into these important environmental initiatives.

Industry leaders have shared with us that these rules, as drafted, pose a threat to the competitiveness of steel producers and tens of thousands of good-paying union jobs. Our understanding is that these rules do not consider current technology capabilities and economic feasibility and may jeopardize the industry's ability to meet other environmental initiatives and health requirements for workers. We also are concerned that any action to diminish the ability of the American steel industry to meet the demands of our economy will be manufactured by

foreign-made and illegally subsidized steel entities that do not meet our current environmental, labor, and accountability standards.

As you move forward, we would strongly encourage you to more openly communicate with steel industry experts and other stakeholders to ensure that proposed requirements are based on proven technology and robust scientific data. It is essential to ensure that proposed rules are technically feasible, financially reasonable, and continue protecting the livelihoods, health, and safety of workers and steel-producing communities throughout our nation.

Sincerely,

Eric A. "Rick" Crawford

U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

We write to you today regarding three U.S. Environmental Protection Agency (EPA) rules that together threaten the economic competitiveness of the American integrated steel industry. We urge EPA to grant the petitions filed by the domestic integrated steel industry seeking administrative reconsiderations and stays of all three final rules until the EPA can complete a comprehensive review of each rule through the administrative reconsideration process.

Working together, EPA and industry have achieved notable reductions in environmental impacts to air, water, and land over the past 50 years. The steel industry in the U.S. is the world's cleanest major producer of steel and is already subject to more environmental regulation than its global competitors, resulting in a cleaner environment. While we appreciate EPA's efforts to address concerns raised by multiple stakeholders – including steel companies, the United Steelworkers (USW), coke producers, and numerous Members of Congress – throughout the rulemaking process, we remain concerned that the final rules contain flaws that will undermine the domestic steel industry and national security while driving production overseas. We are specifically concerned about the following three rules:

- National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing (EPA-HQ-OAR-2017-0664)
- National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-OAR-2002-0083)
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries (EPA–HQ–OAR–2002–0085 and EPA HQ OAR 2003 0051).

A failure to get these regulations right will not only have a negative impact on domestic steel production and American steelworkers, but it will also likely fail to achieve a net reduction in emissions from the steel industry globally. In fact, emissions will likely rise as production moves to countries, like China, with far less stringent rules and regulations. By granting the requested administrative reconsideration and stay of the rules, the EPA and industry can build on their shared track record of success and continue to work together in a constructive manner to achieve durable rules that both protect the environment and our domestic integrated steel industry.

Throughout the rulemaking process, EPA worked to address technical and analytical flaws with these rules raised by multiple stakeholders. The modifications incorporated into the final rules in response to stakeholder feedback were important steps in the right direction, but we remain concerned they did not go far enough in addressing fundamental flaws with the rules. Further modifications are needed to address new information provided to EPA by stakeholders to ensure the rules are achievable by the industry, as required by the Clean Air Act, and that the regulations do not induce unintended consequences, such as loss of domestic steelmaking capacity and jobs. Given all that is at stake in terms of our country's advanced steel manufacturing capabilities and the good-paying, middle class union jobs the steel industry sustains, it is critically important that these rules are technically and economically feasible and do not undermine the competitiveness of the industry.

A stay of these rules will allow EPA to continue to work with industry stakeholders, including domestic companies and the USW, to obtain a complete and thorough understanding of the new information, equipment, and processes and ensure regulations moving forward are sound policy. Absent a stay, the steel industry will be forced to proceed with planning and spending for unproven technologies and work practices while the final provisions of the rules remain uncertain. Given that these regulations will impact nearly every aspect of the integrated iron and steelmaking process, it is imperative that EPA grant both the petitions for reconsideration and requests for stay of the rules.

We urge EPA to grant the industry's petitions for reconsideration and stay requests to ensure that these regulations both safeguard our environment and preserve production capacity and jobs in our strategically important integrated iron and steel sector. Thank you for your work to date with us on these important matters.

Sincerely,

Sherrod Brown

Congress of the United States
House of Representatives
Washington, DC 20515

December 18, 2023

The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

As Chairman and Vice Chairman of the Congressional Steel Caucus, we write to express our concerns regarding the proposed rules below from the U.S. Environmental Protection Agency (EPA):

- National Emission Standards for Hazardous Air Pollutants: National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments (EPA-HQ-OAR-2017-0664)
- Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-EPA-OAR-2002-0083)
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries (EPA–HQ–OAR–2002–0085 and EPA– HQ–OAR–2003–0051).

The American steel industry and its manufacturing workforce produces the world's cleanest steel, made possible by years of substantial investments into climate initiatives. According to the American Iron and Steel Institute, the steel industry has reduced its energy intensity per ton of production by 35 percent and carbon dioxide emissions intensity by 37 percent in the past three decades. We also would highlight that these efforts will continue to be augmented by research and technology investments being made under current law.

We are grateful for your efforts to assist in the implementation of these laws and want to ensure that the proposed rules do not hinder the ability of the American steel industry to make robust investments into these important environmental initiatives.

Industry leaders have shared with us that these rules, as drafted, pose a threat to the competitiveness of steel producers and tens of thousands of good-paying union jobs. Our understanding is that these rules do not consider current technology capabilities and economic feasibility and may jeopardize the industry's ability to meet other environmental initiatives and health requirements for workers. We also are concerned that any action to diminish the ability of the American steel industry to meet the demands of our economy will be manufactured by

foreign-made and illegally subsidized steel entities that do not meet our current environmental, labor, and accountability standards.

As you move forward, we would strongly encourage you to more openly communicate with steel industry experts and other stakeholders to ensure that proposed requirements are based on proven technology and robust scientific data. It is essential to ensure that proposed rules are technically feasible, financially reasonable, and continue protecting the livelihoods, health, and safety of workers and steel-producing communities throughout our nation.

Sincerely,

Eric A. "Rick" Crawford
Member of Congress
Chair, Congressional Steel Caucus

Frank Mrvan
Member of Congress
Vice-Chair, Congressional Steel Caucus

CLIFFS

CLEVELAND-CLIFFS INC

March 31, 2025

U.S. Environmental Protection Agency
1200 Pennsylvania Ave., NW
Washington, DC 20460
Submitted by Electronic Mail to: airaction@epa.gov

RE: REQUEST FOR PRESIDENTIAL EXEMPTION from "National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review" (89 FR 23294; April 3, 2024) on Behalf of Cleveland-Cliffs Inc. Integrated Iron and Steel Manufacturing Facilities[1]

Pursuant to Section 112(i)(4) of the Clean Air Act ("CAA"), Cleveland-Cliffs Inc. ("Cliffs") hereby requests that the President issue a two-year exemption from the compliance deadlines for emission limits and work practice standards promulgated in the final rule *"National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review"* (the "II&S Rule"), published in the *Federal Register* at 89 Fed. Reg. 23,294 (April 3, 2024). This request encompasses extending the compliance dates by two years for each of Cliffs' integrated iron and steel manufacturing ("II&S") plants subject to the rule, pending EPA's reconsideration of the II&S Rule. Cliffs and the American Iron & Steel Institute ("AISI") submitted several rounds of extensive comments and scientific data and analysis on the II&S Rule.

Cliffs is a leading North America-based steel producer and owns five of the eight II&S facilities in the United States (the other three are operated by a separate steel company, which will submit a separate request). Cliffs' facilities include Burns Harbor and Indiana Harbor East and West in Indiana, Cleveland Works and Middletown Works in Ohio, and Dearborn Works in Michigan.

This request explains why an exemption is appropriate for Cliffs' sources impacted by the II&S Rule, because, as specified in section CAA §112(i)(4), the technologies to implement the standards are not available and an exemption is in the national security interests of the United States.

[1] Cleveland-Cliffs Inc. Facilities: Cleveland-Cliffs Burns Harbor Inc.; Cleveland-Cliffs Cleveland Works LLC; Cleveland-Cliffs Steel Corp. Dearborn Works; Cleveland-Cliffs Steel LLC-Indian Harbor East and West; Cleveland-Cliffs Holdings Corp. Middletown Works.

A. BACKGROUND

EPA first promulgated the NESHAPs for the II&S industry pursuant to CAA §112(d) on May 20, 2003, 68 Fed. Reg. 27,646, establishing emissions limitations for HAPs emitted from new and existing sinter/recycling plants, blast furnaces ("BFs"), and basic oxygen process furnace ("BOPF") shops. This rulemaking required all sources to meet HAP emission standards through application of maximum achievable control technology ("MACT"). It included particulate matter emissions limitations and opacity limits for capture systems and control devices. EPA found that "[p]articulate matter and opacity serve as surrogate measures of HAP emissions."[2]

In 2020, the Trump EPA issued a final rule for the II&S source category to fulfill its obligations under CAA sections 112(d)(6) and (f)(2), known as the "risk and technology review" ("RTR"). The 2020 II&S RTR Rule concluded that the original 2003 II&S Rule addressed the risk from hazardous air pollutants with an adequate margin of safety to public health, and that there were no new technologies that justified revisions to the 2003 MACT standards under CAA §112(d)(6).[3]

On April 3, 2024, the Biden EPA promulgated the II&S Rule, revising the Trump EPA's 2020 RTR rulemaking for the II&S source category. The Agency maintains in the 2024 II&S Rule that the residual risk to human health and environment from the II&S source category continues to be acceptable within an ample margin of safety, based on its analysis in the 2020 RTR.[4]

As to the technology review under CAA section 112(d)(6), however, the 2024 II&S Rule establishes new hazardous air pollutant ("HAP") emissions limits at Sinter/Recycling plants (polycyclic aromatic hydrocarbon, carbonyl sulfide, mercury, hydrochloric acid, dioxin/furan toxicity equivalence), BOPFs (total hydrocarbons, hydrochloric acid, dioxin/furan toxicity equivalence), BF stoves (total hydrocarbon, hydrochloric acid), and BF casthouses (total hydrocarbon, hydrochloric acid); and new standards, in the form of opacity limits, operating limits, and work practice standards, for five Unmeasurable Fugitive Intermittent Particulate ("UFIP") sources (unplanned bleeder valve openings; planned bleeder valve openings; small and large bell leaks; iron beaching; and slag processing, handling and storage operations) based on the flawed conclusion that no new technology is required to meet these standards.

EPA justified the slew of new HAP emissions limitations and UFIP source standards based purportedly on a new technology review. Relying on an aggressive interpretation of the D.C. Circuit's decision in *Louisiana Environmental Action Network v. EPA* ("*LEAN*"), 955 F.3d 1088 (D.C. Cir. 2020), the Biden EPA unlawfully and erroneously established new emission limits and work practice standards without consideration of the underlying CAA §112(d) obligation to only "revise as necessary (taking into account developments in practices, processes, and control technologies)." The record does not support the Biden EPA's new technology review and resulting II&S Rule standards. As the Trump EPA had properly concluded in 2020, there is no demonstrated technically feasible or economically reasonable technology that II&S facilities can use to meet the

[2] *Id.* at 27,467.
[3] 85 Fed. Reg. 42,074, 42,074 (July 13, 2020).
[4] *Id.* at 23,312.

new standards in the II&S Rule. Instead, the Biden EPA reached an unsupported conclusion that no new technologies would be necessary to comply with the new standards. This conclusion ignores the plethora of data in the record demonstrating that the standards are unachievable by even the best performing sources, in contravention of the CAA. The II&S Rule require the development and implementation of unproven control equipment that has never been applied in the II&S industry domestically or internationally.

Cliffs filed a petition for judicial review of the final II&S Rule in the D.C. Circuit and a petition for administrative reconsideration and stay of the rule with EPA. A request for judicial stay of the II&S Rule was denied on October 24, 2024, by the D.C. Circuit Court of Appeals after being opposed by the Biden EPA. EPA sent a letter on August 14, 2024, which was supplemented by a letter on March 5, 2025, to those including Cliffs who had submitted administrative petitions for reconsideration on the II&S Rule, announcing its intent to reconsider the Rule. On March 7, 2025, the Trump EPA moved to hold the II&S appeals in abeyance for at least 120 days pending its reconsideration. On March 12, 2025, the EPA Administrator also announced the Agency's intention broadly to reconsider a group of rules establishing or modifying various National Emission Standards for Hazardous Air Pollutants ("NESHAP") including the II&S Rule. On March 31, 2025, EPA issued a temporary stay of the II&S Rule pursuant to section 307(d)(7)(B) of the CAA requirements for 90 days. Cliffs strongly supports EPA's plan to reconsider the II&S Rule for the numerous legal and technical reasons previously raised in industry comments during the notice and comment period preceding the II&S Rule, in Cliffs' lawsuit, and in Cliffs' petition for reconsideration.

EPA further indicated that the President was considering issuing exemptions from compliance dates under CAA §112(i)(4) where appropriate, and that affected sources should provide requests for such exemptions to EPA by March 31, 2025. Cliffs is timely submitting such request herein.

B. NO TECHNICALY FEASIBLE OR COST-EFFECTIVE TECHNOLOGY IS AVAILABLE TO IMPLEMENT THE 2024 II&S RULE

No technically feasible or cost-effective technology is available, or could be available, to implement the standards established in the 2024 II&S Rule. The rule places emission limitations on (1) HAPs and (2) opacity limitations and work practice standards on UFIP sources. These limitations and work practice standards are not feasible to meet due to a lack of technology and flawed implementation of the rulemaking that shows a lack of understanding of the sources in question. Cliffs provided detailed comments explaining why EPA should decline to set new standards, or in the alternative, should set standards that were reasonable, less costly and more likely achievable by the industry. Nevertheless, the Biden EPA promulgated the final II&S Rule imposing onerous, unreasonable and extremely costly standards.

1. Technology to Implement the Hazardous Air Pollutant Emission Standards is Not Feasible

Cliffs has provided numerous technical reports and declarations[5] evidencing that new HAP limitations in the II&S Rule for the Cliffs' facilities listed above are unachievable and require development and installation of unproven control technologies and/or retrofitting that have never been installed domestically or internationally for these sources because the technologies are not available and have not been demonstrated in practice. The II&S Rule fails to consider that not only is this untested technology, but that the facilities also require time for development, trialing, design, procurement, fabrication, and testing to ensure the technology could even achieve its intended purpose. As one industry engineering expert notes: "Typical capital project delivery steps for a major emission control project of this scale typically require 2 – 3 years to implement. The research and development required to conceive of, test and validate a novel solution which does not exist today could easily add another 2-3 years to this typical implementation timeline, provided that a solution is identified."[6]

The affected sources and specific issues with the feasibility of HAP emission limit control technologies are summarized as follows:[7]

- **BOPFs:** Together, the five Cliffs' facilities have fifteen (15) BOPF furnaces, and there is no existing emission control system that can be added to a BOPF furnace that is known to address dioxin/furan, total hydrocarbons, or hydrogen chloride to meet the limits provided in the 2024 II&S Rule. Addressing HAPs for BOPF furnaces will require significant retrofit upgrades to the current systems, the extent of which will depend on whether there is dry electrostatic precipitator or wet scrubber technology already in place. These system upgrades are expected to be particularly challenging, given they will likely need to incorporate (or in the case of wet scrubbers, completely replace with) novel treatment technology such as a recirculating baghouse system with injected lime and/or carbon, which are not commercially available.

- **BF Casthouses:** Together, the five Cliffs' facilities have seven (7) BF casthouses, and there is no existing add-on emission control that is proven to meet the HAP limitations for hydrogen chloride or total hydrocarbons. Moving forward with the limits in the rulemaking

[7] Declaration of David Mysko, P.E. of Hatch Associates Consultants, Inc. (Sept. 17, 2024) (attached as Exhibit L to Cliffs' Reply); Declaration of Ryan Siats of Barr Engineering (June 18, 2024) (attached as Exhibit E to Cliff's Motion for Stay).

will require application of novel treatments such as carbon lime and/or bicarbonate injection systems, which are not commercially available.

- **BF Stoves:** Together, the five Cliffs' facilities have seven (7) clusters of BF stoves, and there is no existing add-on emission control that is proven to meet the HAP limitations for hydrogen chloride or total hydrocarbons. Moving forward with the limits in the rulemaking will require application of novel treatments such as carbon lime and/or bicarbonate injection systems that are not commercially available.

- **Sinter Recycling Plants**: One Cliffs' facility, Burns Harbor, has a sinter recycling plant with a wet scrubber. This plant would need to install a new sinter plant windbox emission control system paired with activated carbon injection ("ACI") to meet the new standards. A fatal flaw, however, is that use of ACI is not actually feasible as an add-on control because there is not sufficient residence time for contact with the carbon and absorbing material (in this case, mercury, dioxin/furan, and/or polycyclic aromatic hydrocarbons). The technology of ACI is primarily intended for use with recirculating baghouses and the effects when paired with a wet scrubber are unclear and may include negative consequences such as unintended localized emissions and significant carbon waste generation in the resulting sludge.

As noted above and in more detail with our numerous technical reports and declarations[8], the II&S Rule "will require development and installation of unproven control technologies that have never been installed domestically or internationally for these source categories."[9] Cliffs must evaluate, develop, trial, permit, design, procure, fabricate, and install novel technology and emission control systems. This industry specific technology which may or may not achieve the standards in the end needs to be developed for the first time.[10] EPA's erroneous assumptions about the transfer of control technology demonstrate a poor understanding of this industry sector and warrant time for thorough reconsideration. A Presidential exemption is important to achieve this extended timeline.

2. Technology to Implement UFIP Standards Is Not Feasible

For the UFIP sources, the opacity limitations and work practice standards are so fundamentally flawed that there is no existing technology capable of complying with the Rule. In order to meet the UFIP standards, experts have opined that "[s]ources unable to achieve compliance with the final standards may require the development and implementation of control equipment or control measures that has never been applied in the II&S industry."[11] Cliffs submitted

ED_021114_00002868-00005

data demonstrating that even the best performing sources are not able to continuously achieve the new limits. [12] In addition, new limits set by the Rule, even assuming technology existed, pose safety dangers in the facilities in direct conflict with the CAA's General Duty Clause in Section 112(r).

The affected sources and specific UFIP control feasibility issues are summarized as follows:

- **Unplanned Bleeder Valve Openings:** Bleeder valves are emergency release devices that relieve pressure from a BF to prevent explosions or other catastrophic events. EPA took the extraordinary step of attempting to set numeric limits on the unplanned opening of bleeder valves, pitting environmental compliance against worker health and safety, by discouraging valve opening, in direct conflict with the stated intent of Congress (H.R. 101-490, Part 1 (328)). However, technical data demonstrates that three of four MACT Floor (or "best performing") sources for large BFs cannot achieve this limitation and are therefore unachievable without adding control equipment.[13] Specifically, bleeder valves are intended to reduce the risk of catastrophic overpressure conditions in a BF. Not only are the limits unachievable, but experts have explained that the work practice standards "prescribes technologies that may not result in the reduction of valve openings or may be infeasible on certain BF units."[14] Moving forward with the limits in the rulemaking will require the application of control equipment which is not commercially available.

- **Planned Bleeder Valve Openings:** Not only are the standards unrepresentative of the data, but the calculation of the opacity standard for planned bleeder valve openings used a calculation method that did not adequately account for the underlying long-term operational variability. This incorrect calculation directly resulted in three of the five MACT Floor sources for Blast Furnaces being unable to achieve this limitation.[15] Moving forward with the limits in the rulemaking will require the application of control equipment which is not commercially available.

- **Iron Beaching:** Emissions generated by the transfer and pouring of hot molten iron (beaching) are not only de minimis in nature but were already adequately controlled by existing work practices that require flexibility in approach given the spacing and safety limitations based on different facility configurations. EPA's proposed technologies include "infeasible (and unsafe) enclosure of beaching operations and/or installation of CO2 suppression."[16] This is particularly the case where [t]he installation of enclosures would be infeasible at facilities with space limitations," such as four of the eight facilities with such limited space that the "retrofit construction of an enclosure [is] virtually impossible."

[14] *Id.* at 7.
[15] *Id.* at 7.
[16] *Id.*

ED_021114_00002868-00006

- **Small and Large Bells**: Bells are part of the charging system on top of the BF that allows for materials to be loaded into the furnace or next bell (as in the case of small bells) without letting BF gas escape). Every furnace, and its corresponding bells are unique in "age, size, design, air flow, raw material usage, and production specification."[17] Additionally, "[e]very bell top campaign is unique, and both small and large bell replacements and repairs (depending on the repair required) are large capital projects that require indefinite lead times for equipment design, project planning (i.e., engineering, safety protocols, and logistical coordination) and corporate approval and funding authorizations for capital expenditures",[18] making the short timeframe for taking action in the II&S Rule technically infeasible.

- **Slag Processing, Handling and Storage**: New opacity limits for slag processing, handling, and storage operations relied on a dataset that did not represent all categories of operations ultimately regulated by the II&S Rule. The resulting limits are unachievable by the best performing sources and fail to adequately account for variability across the different types of processes that EPA attempted to capture with a single opacity limit. Further, the II&S Rule's restrictions on slag operations may require design controls (e.g., enclosures) that create unsafe operating conditions given slag can be highly reactive, especially in contained areas.[19] As discussed in the Declaration of Charles Ochola, President of the National Slag Association, "one of the direct results of using water to control emissions is the creation of pooled water. Standing water associated with emission controls, nature, or any source creates an extremely hazardous condition anywhere molten slag is managed. Pouring molten slag into the smallest puddle of water will create a reaction very similar to an explosion, putting operators and the community at risk for serious if not deadly injury … The use of emission controls that rely upon water are limited by the extreme hazard caused from adding molten slag, iron or steel to standing water."[20]

A Presidential exemption is warranted here, where safe and technically feasible control technology is not available to implement the standard.

3. Technology to Implement the II&S Rule Standards Is Not Cost Effective

Due to the II&S Rule's onerous implementation and compliance schedule for these standards, Cliffs is in an impossible position of designing and engineering novel systems with unproven technology within a short time frame. The cost of compliance is disproportionately high and the amount of work leading up to the compliance date is enormous.

Even EPA's March 12, 2025, Fact Sheet supporting reconsideration of multiple NESHAP rules including the II&S Rule grossly understated costs to comply, citing "[e]stimated costs of $45 million over the next decade (including $7.1 million in capital investment or $5.3 million

[17] *Id.* at p. VI-32.
[18] *Id.* at p. VI-35.
[19] Declaration of Mike Remsberg of Trinity Consultants, p. 8 (June 18, 2024) (attached as Exhibit D to Cliffs' Motion for Stay.)
[20] Declaration of Charles Ochola, President of the National Slag Association (May 31, 2024) (Attachment E to Cliffs' Reconsideration Petition).

annually)."[21] In reality, "[d]ue to the high variability of the process and raw materials, if all facilities required installation of new emission control equipment," industry "estimated initial costs to achieve compliance with the new gap filling HAP limits will be approximately $3.2 billion in capital investment and $749 million annually going forward."[22] For the Cliffs' Burns Harbor Sinter/Recycling Plant alone, the corrected average cost effectiveness for application of control technology "is more than $500,000 per *gram* of dioxin furan controlled, or $237.3 million per pound controlled. This is without considering prior industry comments regarding US EPA's underestimation of control costs, which would only serve to increase the cost per mass controlled."[23]

Similarly, industry estimates for UFIP removal placed annual costs at $290 million per year, with a cost-effectiveness rate of $819 million per ton of HAP removed.[24] For unplanned bleeder valve openings alone, the cost effectiveness rate is $1.3 million per ton of HAP removed (using corrected EPA data) or even potentially $10 million per ton of HAP removed (using industry data).[25] Further, EPA failed to correct erroneous HAP emissions, resulting in overstated HAP emissions and inflated benefits. Reductions in HAPs for bells is so small, at barely 100 pounds for 15 BFs, that there is no estimate that makes this cost-effective. Reductions in HAPs for beaching is likewise not meaningful given how infrequently beaching occurs and industry estimates ranging in reduction of only 5 to 20 pounds per year across all eight II&S facilities.

As noted above, EPA's own risk assessment showed that even without controls, emissions from the industry presented an acceptable level of risk with an ample margin of safety. As a result, any costs expended to meet these standards are unreasonable, and, by definition, not cost-effective.

C. IT IS IN THE NATIONAL SECURITY INTERESTS OF THE UNITED STATES TO PROVIDE AN EXEMPTION FROM THE II&S RULE COMPLIANCE DATES

The II&S Rule will have far-reaching consequences, given that the American iron and steel industry is the backbone of the nation's defense and transportation industries and is critical to national security. The U.S. Department of Commerce recognized that domestic steel production is essential for national security applications which it indicated encompasses transportation systems, the electric power grid, water systems, and energy generation systems in its report summarizing the findings of an investigation conducted by the Department of Commerce pursuant to Section 232 of the Trade Expansion Act of 1962, as amended (19 U.S.C. § 1862 ("Section 232")), into the effect of imports of steel mill products ("steel") on the national security of the United States.[26] In a 2021, Congressional Research Service Report on U.S. Steel Manufacturing:

---

[22] AISI Comments, p. VII-60.

[23] Declaration of Ryan Siats of Barr Engineering (June 18, 2024) (attached as Exhibit E to Cliff's Motion for Stay).

[24] AISI Comments, p. VI-3.

[25] *Id.* at p. VI-29.

[26] *See* U.S. Department of Commerce Bureau of Industry and Security Office of Technology Evaluation, *The Effect of Imports of Steel on the National Security Report, Report by the January 11, 2018*, https://www.commerce.gov/sites/default/files/the_effect_of_imports_of_steel_on_the_national_security_-_with_redactions_-_20180111.pdf

National Security and Tariffs, it was noted that under the Defense Production Act, 50 U.S.C. §4533, "Congress provides the President with a broad set of authorities …, including Title III, which authorizes the use of economic incentives to secure domestic industrial capabilities essential to meet national defense and homeland security needs. DOD has funded several Title III projects to increase domestic production of steel products," including a $56 million agreement in 2020 to boost steel plate production signed by the predecessor owner of a Cliffs' facility.[27]

The II&S Rule, if implemented, would both increase the cost of producing steel and the products derived therefrom. This would have a negative impact on multiple other industries and activities, harming the national security interests of the United States. Ensuring the strength and global competitiveness of this industry is of vital importance to the nation's economy, security, and manufacturing prowess. Supporting this is the fact the industry provides more than **$520 billion** in economic output, nearly **two million jobs,** more than **$130 billion in wages and benefits** to employees, and **$56 billion in federal, state and local taxes**. Cliffs alone employs approximately 27,000 people, most of whom are members of unions such as the United Steelworkers and the International Association of Machinists and Aerospace workers.

The American iron and steel industry is already among the most regulated and cleanest steel industries in the world. Rulemaking must take into consideration the necessary role that the domestic integrated iron and steel industry plays in our country. Members of Congress have already expressed their concern on this rulemaking. Eight current or former U.S. Senators (Senators Brown, Vance, Braun, Manchin, Casey, Klobuchar, Capito and Young) wrote a letter to EPA warning the Agency that its three proposed rules aimed at the steel industry – impacting taconite iron ore processing, coke manufacturing, and integrated iron and steelmaking – "would dramatically undermine the domestic steel industry and national security while driving production overseas …."[28] Similarly, Congressmen Crawford and Mrvan, Chair and Vice-Chair of the Congressional Steel Caucus, respectively, wrote a letter to then EPA Administrator Regan, expressing their concerns over the proposed rulemakings targeting the steel industry, concluding that the rulemakings, including the II&S Rule, would threaten advancements already made by the industry into environmental initiatives while "pos[ing] a threat to the competitiveness of steel producers and tens of thousands of good-paying union jobs."[29]

The II&S Rule could further "diminish the ability of the American steel industry to meet the demands of our economy" which may lead to those demands being met by "foreign made and illegal subsidized steel entities that do not meet our current environmental, labor, and accountability standards." These fears ring true, as the U.S. Department of Commerce has already found excessive quantities of imports displacing domestic steel – steel that is not produced as clean as in the United States. Such a result is counterintuitive to the purpose of the CAA and threatens the nation's domestic steelmaking supply chain. The Congressmen conclude in their letter by "strongly

[27] Congressional Research Service Report, *U.S. Steel Manufacturing: National Security and Tariffs* (August 12, 2021), https://www.congress.gov/crs-product/IF11847.
[28] Letter from U.S. Senators Brown, Vance, Braun, Manchin, Casey, Klobuchar, Capito, and Young to Michael Regan, EPA Administrator (Dec. 6, 2023), pp. 1-2.
[29] Letter from Congressmen Crawford and Mrvan, Chair and Vice-Chair of the Congressional Steel Caucus, to Michael Regan, EPA Administrator (Dec. 18, 2023).

encourage[ing]" EPA to communicate with "industry experts and other stakeholders" and ensure that the final rulemakings are "technically feasible, financially reasonable, and continue to protect the livelihoods, health, and safety of workers and steel-producing communities throughout our nation." That is exactly what this Administration is doing by providing outreach in the form of a Presidential Exemption, and we ask that you consider this request on its merits.

The threat of global steel imports raised by the Senators in the letters to EPA is a material threat. Foreign steel imports risk the competitiveness and advancement of the domestic steel industry, to the point of potentially threatening U.S. domestic production capacity and continued investment in taconite iron mining, coke manufacturing, and iron and steelmaking capacity based on the costs outlined above. As emphasized by the U.S. Department of the Treasury's Committee on Foreign Investment in the United States ("CFIUS"), without such domestic steelmaking investment, there could be ripple effects on the supply chains that depend on such steel, particularly supply chains that are part of our national defense infrastructure such as "critical manufacturing, energy, transportation, and communications (all vital to national security)."[30] National defense infrastructure, for example, needs ready access to high purity steel from blast furnaces.[31] Once these complicated iron and steel making operations are shut down and/or idled, it is no simple matter to restart them. In short: "The loss of domestic production is a critical national security concern given the ubiquitous nature of steel throughout multiple critical industries."[32]

For all the reasons stated above, Cliffs urges the issuance of a two-year exemption from the compliance deadlines in the final II&S Rule, pending EPA's review of the rule for possible revision. If you have questions or need additional information, please contact Walter Tamukong at 216-694-4862 or at walter.tamukong@clevelandcliffs.com.

Dear Administrator, Hon. Lee M. Zeldin:

On behalf of Cleveland-Cliffs Inc., Please see attached request for **presidential exemption from "National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review" (89 FR 23294; April 3, 2024) on Behalf of Cleveland-Cliffs Inc. Integrated Iron and Steel Manufacturing Facilities**

We are requesting two-years presidential exemption in accordance with CAA § 112(i)(4) for Cliffs' facilities which includes Burns Harbor and Indiana Harbor East and West in Indiana, Cleveland Works and Middletown Works in Ohio, and Dearborn Works in Michigan.

Granting the extension will not result in any unacceptable risks to the public or the environment because EPA has determined that the source category presents an acceptable risk to human health with an ample margin of
safety with the present controls, requirements, and limits already in effect.

Also attached are three referenced documents (**Congressional letters**) to support the request for **Presidential exemption of steel manufacturers and related supply chains from:**

- National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review (89 FR 23294; April 3, 2024)
- National Emission Standards for Hazardous Air Pollutants: Lime Manufacturing Plants Technology Review, EPA Docket No. OAR-2017-0015, RIN 2060-AV59, 89 Fed. Reg. 57,738
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries; Residual Risk and Technology Review, and Periodic Technology Review (89 FR 55684; July 5, 2024) (Coke Ovens Rule)
- National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing, EPA Docket No. OAR-, RIN, 89 Fed. Reg. 16408 (March 6, 2024)

If you have questions or need additional information, please contact Walter Tamukong at 216-694-4862 or at walter.tamukong@clevelandcliffs.com

Sincerely

Walter Tamukong

Subject: ASARCO LLC's Response to March 24 Invitation to Request an Exemption under CAA Section 112(i)(4)
Date: Friday, March 28, 2025 6:37:13 PM

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Dear [redacted],

I am sending this e-mail on behalf of ASARCO LLC (Asarco), in response to your March 24 invitation to the regulated community to submit requests for exemption from any of nine different NESHAPs pursuant to Clean Air Act § 112(i)(4).

As you may know, Asarco owns and operates one of the last three primary copper smelters in the United States. Asarco's smelter, in Hayden, Arizona, is presently inactive pending the completion of several federal regulatory proceedings that, depending on their outcomes, will determine whether it would be financially viable for Asarco to reactivate the smelter. In the ten years preceding the smelter's inactivation in 2019, the smelter produced 1.3 million metric tons of primary-refined copper, which was roughly 7% of the United States' domestic demand for refined copper during the same period.

Asarco's request for § 112(i)(4) exemption, further below, concerns four provisions of the new 40 C.F.R. Part 63, Subpart QQQ rules, which were finalized in the Federal Register on May 13, 2024, 89 Fed. Reg. 41648, and are hereinafter referred to as the Copper Rules.

Please note, the same four provisions of the Copper Rules are similarly addressed in a petition for administrative reconsideration of the rules that Asarco filed with EPA on July 12, 2024. Asarco's corresponding petition for judicial review of the Copper Rules, before the 9th Circuit Court of Appeals, is presently held in abeyance while EPA considers Asarco's petition for administrative reconsideration. Asarco believes it would be appropriate for the § 112(i)(4) exemption requested below to be granted during the pendency of EPA's final action on the petition for administrative reconsideration. Asarco also believes it would be appropriate for EPA's final action on the petition for administrative reconsideration ultimately to be consistent with the § 112(i)(4) exemption if the exemption is granted.

The four provisions of the Copper Rules that merit a § 112(i)(4) exemption are as follows:

1. The test methods specified at 40 C.F.R. § 63.1450(e) for determining compliance with the smelter roofline PM emissions-rate limit in 40 C.F.R. § 63.1444(h), on the grounds that:

a. Method 17, which is central to the test methods specified, cannot practicably or safely be employed at the smelter roofline vents, in conjunction with the

other test methods that are specified, to determine roofline PM emissions rates in pounds per hour.

b. Satisfying the requirement, at § 63.1450(e)(v), to "waive" isokinetic calculations will inevitably cause the roofline PM emissions rates that are calculated using the methods specified to be unrepresentative of actual PM emissions rates at the roofline.

2. The PM emissions-rate limit in 40 C.F.R. § 63.1444(h), on the grounds that, absent a test method that can practicably and safely be implemented or result in calculated PM emissions rates that are representative of actual PM emissions rate at the roofline, a roofline PM emissions-rate limit, such as that specified in § 63.1444(h), should not be imposed. Rather, the comprehensive design and work practice standards that are separately imposed in the Copper Rules specifically to control process-fugitive PM emissions should constitute the extent of the Copper Rules' provisions that are geared to limit PM emissions at the roofline.

3. The test methods specified at 40 C.F.R. § 63.1450(g) for determining compliance with the smelter roofline Pb emissions-rate limit in 40 C.F.R. § 63.1444(p)(1), on the grounds that:

a. Method 17, which is central to the test methods specified, cannot practicably or safely be employed at the smelter roofline vents, in conjunction with the other test methods that are specified, to determine roofline Pb emissions rates in pounds per hour; and,

b. Satisfying the requirement, at § 63.1450(e)(v), to "waive" isokinetic calculations will inevitably cause the roofline Pb emissions rates that are calculated using the methods specified to be unrepresentative of actual Pb emissions rates at the roofline.

4. The Pb emissions-rate limit in 40 C.F.R. § 63.1444(p)(1), on the grounds that, absent a test method that can practicably and safely be implemented or result in calculated Pb emissions rates that are representative of actual Pb emissions rate at the roofline, a roofline Pb emissions-rate limit, such as that specified in § 63.1444(p)(1), should not be imposed. Rather, the comprehensive design and work practice standards that are separately imposed in the Copper Rules specifically to control process-fugitive Pb emissions should constitute the extent of the Copper Rules' provisions that are geared to limit Pb emissions at the roofline.

Asarco's concerns regarding the Copper Rules' imposition of Method 17 and "waiver" of isokinetic calculations, in 40 C.F.R. §§ 63.1450(e) and § 63.1450(g), are amplified as follows:

A. It is basically impossible to accomplish Method 17 sampling across and within the large vent-openings of the smelter building. Those vent-openings are situated along the roofline of the smelter building in conditions of extreme heat that arise from the smelting, converting and anode-refining operations below—which are further

exacerbated during the hot Arizona summers. The temperatures at the roofline often exceed 150 degrees Fahrenheit. We are justifiably reluctant to require an Asarco employee or contractor to stand at the vent-openings and maneuver the sampling probe, across and within the vent-openings, in that environment, to the degree and for the duration needed to collect a robust set of samples according to the procedures specified in 40 C.F.R. §§ 63.1450(e) and § 63.1450(g).

B. The purpose of isokinetic sampling, which is a standard feature of Method 17, is amply stated in the administrative record, as to in-stack sampling to determine compliance with process stack emissions. That purpose is to ensure a representative collection by drawing the sample from the stack at the same velocity as the gas stream, which is crucial for accurate emissions measurements and demonstrations of compliance with numeric emissions limits. The Copper Rules' "waiver" of isokinetic calculations, at 40 C.F.R. §§ 63.1450(e)(1)(v) and 63.1450(g)(1)(v), reflects EPA's recognition that such sampling cannot occur across and within the large vent-openings of the smelter roofline, given the "low flow rates and high variability" of flow. But the "waiver" leaves entirely unaddressed the problem that sampling and calculations that are not isokinetic are incapable of yielding accurate emissions measurements for purposes of demonstrating compliance with numeric emissions limits. Without the "isokinetic" requirement, there would be no assurance that the velocity of flow entering the sampling probe's nozzle is representative of actual flow, making the corresponding calculations of the emission rates in pounds per hour meaningless for purposes of demonstrating compliance with the PM and Pb emissions-rate limits specified in 40 C.F.R. §§ 63.1444(h) and 63.1444(p)(1).

Based on the information provided above, Asarco recommends that owners and operators of primary copper smelters be exempted, under Clean Air Act § 112(i)(4), from having to comply with 40 C.F.R. §§ 63.1444(h), 63.1450(e), 63.1444(p)(1), and 63.1450(g).

Thank you for the opportunity to provide this information.

Please do not hesitate to let me know if you have any questions regarding the information; or would like to convene a virtual meeting to discuss the information further—including, perhaps, Freeport McMoRan, which operates the primary copper smelter in Miami, Arizona.

Sincerely,

James M. Stewart

CLIFFS

CLEVELAND-CLIFFS INC.

September 30, 2025

The Honorable Donald J. Trump
President of the United States
The White House
1600 Pennsylvania Avenue, NW
Washington, DC 20500

Re: Supplement to Request by Cleveland-Cliffs Inc. (Cleveland-Cliffs) for Presidential Exemptions Pursuant to Section 112(i)(4) of the Clean Air Act

Dear President Trump:

Due to important recent developments, Cleveland-Cliffs is submitting this supplement to its two pending requests for a two-year Presidential Exemption pursuant to section 112(i)(4) of the Clean Air Act.

On March 31, 2025, Cleveland-Cliffs submitted requests for Presidential Exemptions under 42 U.S.C. §7412(i)(4) for the following rules and facilities:

Rule	Facilities
2024 Coke Ovens Rule[1]	Cleveland-Cliffs Burns Harbor LLC Cleveland-Cliffs Cleveland Works LLC, Warren Location Cleveland-Cliffs Monessen Coke LLC
2024 Integrated Iron and Steel (II&S) Risk and Technology Rule[2]	Cleveland-Cliffs Burns Harbor LLC Cleveland-Cliffs Cleveland Works LLC Cleveland-Cliffs Steel Corp. Dearborn Works Cleveland-Cliffs Steel LLC-Indian Harbor East and West. Cleveland-Cliffs Holdings Corp. Middletown Works

A copy of each Presidential Exemption request is enclosed herein.

[1] National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries; Residual Risk and Technology Review, and Periodic Technology Review, 89 Fed. Reg. 55684 (July 5, 2024) (collectively, the "2024 Coke Ovens Rule").

[2] National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review, 89 Fed. Reg. 23,294 (April 3, 2024) (the "2024 II&S Rule").

ED_021114_00002884-00001

These requests detail the many reasons why a Presidential Exemption is justified because the technologies needed to implement the requirements of the 2024 Coke Ovens Rule and 2024 II&S Rule are not currently available and a two-year exemption advances U.S. national security interests by promoting a strong U.S. steelmaking industry; avoiding unnecessary and counterproductive government mandates that lead to coke, iron, and steel shortages; avoiding offshoring of coke, iron, and steel production; and promoting the economic and job growth made possible by the coke, iron and steel industries.

After these requests were submitted, EPA published interim final rules ("IFRs") extending 2025 and 2026 compliance deadlines for the 2024 Coke Ovens Rule and 2024 II&S Rule to new deadlines in 2027. *See* 90 Fed. Reg. 29,997 (July 8, 2025) ("Coke IFR"); 90 Fed. Reg. 29,485 (July 3, 2025) ("II&S IFR"). The purpose of the IFRs was to provide U.S. coke and integrated iron and steel producers additional time to take necessary steps to comply with the 2024 rules in light of EPA's conclusion that they contained numerous errors, ambiguities, and technically infeasible requirements that demonstrated that the 2025 and 2026 deadlines in the rules were not practicable and in some instances were impossible. In light of these findings, the IFRs extend 2025 and 2026 deadlines to 2027, which is the longest compliance period EPA can grant by statute for existing sources, absence of a Presidential Exemption. *See* 42 U.S.C. §7412(i)(3).

Recent developments in the litigation brought by several environmental organizations challenging the Coke IFR and II&S IFR makes granting these requests for Presidential Exemptions even more time sensitive. In the Coke IFR litigation, **EPA has stated that it intends to sign a final action withdrawing the Coke IFR by October 2, 2025**. The effect of withdrawing the Coke IFR is that the original compliance dates in the 2024 Coke Ovens Rule—one of which has already passed—will be restored. Without the issuance of a Presidential Exemption, U.S. coke producers, including Cleveland-Cliffs' facilities, face non-compliance with illegal, unnecessary, and infeasible requirements imposed by the previous administration. Unless relief is granted, our company and the entire coke making industry would be subject to infeasible requirements even though the technologies needed to comply are currently unavailable or not demonstrated to work in the coke byproduct recovery industry.

The requested two-year Presidential Exemption would allow additional time to develop and demonstrate new compliance technologies and needed time to retrofit facilities as needed for compliance with a revised Coke Ovens Rule, without losing coke production that is critical to the U.S. steel industry and national security.

Similar grounds support issuance of a Presidential Exemption now for the 2024 II&S Rule. Environmental organizations have challenged the II&S IFR, both before the Agency and before the D.C. Circuit. The II&S IFR itself remains under review at EPA, with a comment period open until October 3, and briefing of the environmental organizations' judicial challenge is complete, placing the issue directly before the D.C. Circuit. As a result, while EPA has defended the II&S IFR to date, industry has no assurance that EPA will preserve the II&S IFR after its announced withdrawal of the Coke IFR or that the D.C. Circuit will not act in a manner

that undermines or eliminates the vital protection the IFR provides. Because the status of the II&S IFR is at risk, a Presidential Exemption now is the only tool available to ensure that unsafe and impracticable requirements will not snap back into place with little or no notice.

Presidential Exemptions for the 2024 Coke Ovens Rule and 2024 II&S Rule are also needed even if the IFRs remain in place. The IFRs extend immediate deadlines in each rule to 2027, but they leave the substantive requirements in each rule. As the IFR's themselves reflect, the new deadlines are not to offer breathing room while EPA completes reconsideration of the 2024 rules. Rather, they are intended only to establish new deadlines that the agency considers to be "as expeditiously as practicable." 42 U.S.C. §7412(i)(3)(A). The 2024 Coke Ovens Rule and 2024 II&S Rule require substantial new developments in technology, including research, engineering, permitting, construction, installation, and shakedown, that cannot be implemented in less than three years and in many cases will require substantially longer, if they can be achieved at all. Industry has urged the withdrawal of these illegal and impracticable and in some instances unsafe—standards, and industry fully supports EPA's revision of these requirements through reconsideration, but while the 2024 rules are in place, they are causing ongoing harm even with 2027 compliance deadlines.

For example, on July 17, 2025, you granted much-needed relief for the U.S. taconite industry in the form of a Presidential Exemption because a 2024 rulemaking (the "Taconite Rule") placed "significant burdens on a sector critical to the Nation's industrial foundation" by mandating "compliance with standards that rely on emissions-control technologies that have not been demonstrated to work in the taconite industry, are untested at commercial scale, or are not reasonably achievable under current operational conditions."[3] As you appropriately found, if "enforced under the current timeline as set forth at 89 FR 16408, the Taconite Rule risks forcing shutdowns, reducing domestic production, and undermining the Nation's ability to supply steel for defense, energy, and critical manufacturing. The United States must not allow inflexible regulatory deadlines to jeopardize a material critical to our industrial base. Maintaining this capacity is essential to our national security and economic resilience."[4] These very same considerations support Presidential Exemptions for the coke and integrated iron and steel industries, which are also vital to maintaining the nation's ability to supply steel for defense, energy, and critical manufacturing.

Cleveland-Cliffs respects that EPA is working diligently to establish sensible and scientifically sounds regulations, but this process also takes time. The damage caused by the 2024 Coke Ovens Rule and 2024 II&S Rule is ongoing and, absent a Presidential Exemption, unavoidable. The harm will be exponentially worsened if the IFRs are withdrawn or vacated on short notice. For the 2024 Coke Ovens Rule, that result is imminent considering EPA's own statements. For the 2024 II&S Rule, it is a risk the industry must be prepared to address. **A timely Presidential Exemption covering both the 2024 Coke Ovens Rule and the 2024 II&S**

[3] https://www.whitehouse.gov/presidential-actions/2025/07/regulatory-relief-for-certain-stationary-sources-to-promote-american-iron-ore-processing-security/
[4] *Id.*

Rule will therefore save the coke and integrated iron and steel industries from significant confusion, wasted resources, and likely protracted litigation. This is of particular importance at a time when the Country is reasserting the dominance of its domestic manufacturing capabilities, shoring up its national security infrastructure, and needs a robust and dependable domestic supply of coke, iron, and steel for these purposes.

For the reasons set forth in the applications submitted previously, and enclosed with this letter, Cleveland-Cliffs respectfully urges your attention to this vital matter and requests that you provide the relief needed to protect U.S. national and economic security interests through the issuance of Presidential Exemptions for the above rules and facilities.

Thank you for considering this important and time sensitive request. Please contact me at Terry.Fedor@clevelandcliffs.com if any additional information is needed regarding this request.

Respectfully submitted,

Terry G. Fedor

Re: Presidential Exemption: National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries; Residual Risk and Technology Review, and Periodic Technology Review (89 FR 55684; July 5, 2024) (Coke Ovens Rule)

Cleveland-Cliffs Inc. hereby requests a Presidential Exemption under Clean Air Act (CAA) section 112(i)(4) for Cleveland-Cliffs Burns Harbor LLC; Cleveland-Cliffs Cleveland Works LLC, Warren Location; and Cleveland-Cliffs Monessen Coke LLC (collectively "Cleveland-Cliffs") from compliance with the standards and limitations in the National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries; Residual Risk and Technology Review, and Periodic Technology Review, 89 Fed. Reg. 55684 (July 5, 2024) (collectively, the "Coke Ovens Rule").

Cleveland-Cliffs operates three coke oven plants that feed our five integrated steel mills across Indiana, Michigan, and Ohio. We also purchase coke from merchant suppliers including Sun Coke and ESS Coke. Cliffs invested $1 billion to build a facility to produce Hot Briquetted Iron (HBI), consumption of which in our furnaces has reduced coke consumption. However, Cliffs' ironmaking operations must still rely on coke as a key raw material to meet critical production needs.

On July 5, 2024, EPA promulgated the final Coke Ovens Rules, which establishes:

1) New maximum achievable control technology (MACT) standards for acid gases (AG), dioxin and furans (D/F), formaldehyde, hydrogen cyanide (HCN), mercury (Hg), polycyclic aromatic hydrocarbons (PAH), and volatile organic HAP (VOHAP) from coke oven pushing operations;

2) MACT and work practice standards for AG, D/F, HCN, Hg, PAH, particulate matter (PM), HAP metals, and VOHAP from coke oven battery stacks;

3) New facility fenceline emission monitoring and corrective action requirements; and

ED_021114_00002885-00001

4) Lowered limits for leaks from coke oven doors, lids, and offtakes.

The American Coke and Coal Chemicals Institute (ACCCI) and Coke Oven Environmental Task Force (COETF), in which Cleveland-Cliffs participates, filed a petition for reconsideration and administrative stay of the Coke Ovens Rule, urging EPA to reconsider numerous aspects of the Coke Ovens Rule and to stay the effective date pending promulgation of replacement regulations.[1] On March 12, 2025, EPA announced it will reconsider several National Emission Standards for Hazardous Air Pollutants (NESHAPs) affecting a broad range of American industry, including the Coke Ovens Rule. On March 21, 2025, EPA informed the COETF that it will reconsider all the issues included in our petition for reconsideration for the Coke Ovens Rule.

CAA section 112(i)(4) provides that the President may exempt any stationary source from compliance with any standard or limitation under section 112 for up to two years if the President determines that the technology to implement such standard is not available and it is in the national security interests of the United States to do so. Section 112(i)(4) further provides that an exemption may be extended one or more additional periods, each additional period not to exceed two years.

Cleveland-Cliffs is requesting a two-year Presidential Exemption for each of the following Coke Ovens Rule requirements:

1) Fenceline monitoring, root cause and corrective action, and related reporting requirements;

2) Limits for allowable leaks from coke oven battery doors, lids, and offtakes and related reporting requirements; and

3) New MACT and work practice standards for coke oven pushing and battery stacks and related testing and reporting requirements.

A Presidential Exemption is warranted for the reasons detailed below.

I. This Request is Timely

This request has been submitted by the March 31, 2025 date indicated in EPA's Clean Air Act Section 112 Presidential Exemption Information fact sheet.

[1] The ACCCI/COETF's comments on the proposed rule and petition for reconsideration and stay are hereby incorporated by reference in support of this request. *See* ACCCI/COETF Petition for Reconsideration and Stay of the National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries; Residual Risk and Technology Review, and Periodic Technology Review (Sept. 3, 2024) ("ACCCI/COETF Petition for Reconsideration and Stay"); COETF Comments on the Proposed Rule National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries; Residual Risk and Technology Review, and Periodic Technology Review (Oct. 2, 2023) ("COETF Comments"), available at https://www.regulations.gov/comment/EPA-HQ-OAR-2003-0051-1380.

II. The Technology Needed to Implement the Coke Ovens Rule is Not Available

A. Fenceline Monitoring Requirements

For the reasons set forth in the ACCCI/COETF petition for reconsideration, the fenceline monitoring benzene action level in the Coke Ovens Rule is overly stringent and is not based on modeling showing the correct highest benzene concentration at the facility fenceline using allowable (vs. actual) emissions. As a result, new and currently unavailable emission controls and leak detection/repair technology would be necessary to comply with the unlawful action level. Due to the complex nature of coke facilities, developing new control strategies and technologies would involve engineering suitable capture and control systems at multiple locations. The technologies needed to identify and engineer controls suitable for each location are not currently demonstrated or available for the coke ovens or associated coke byproducts recovery systems.

Likewise, the "root cause" investigation and corrective action requirements add significant complexity and technology challenges, considering the many miles of piping and thousands of valves and flanges at a coke facility. Methods to further reduce benzene emissions are not currently demonstrated for coke facilities and would include redesign or modification of process vessels, tar decanters, gas blanketing and vapor collection systems, replacing sections of coke oven gas piping, and redesign of tar and light oil loadout systems to reduce fugitive emissions and/or leak rates.

B. Revised Standards for Coke Oven Battery Doors, Lids, and Offtakes

The Coke Ovens Rule lowers the long-standing allowable leak limits for coke battery doors, lids, and offtakes including for the first time more stringent leak rate allowables on a single coke facility based on annual coke production. However, industry commenters informed EPA that there have been no changes or improvements in leak control technology or practices across the industry, which means facilities cannot consistently achieve the lower leak rate limits without developing novel new leak control methods or technologies for both coke ovens and associated coke byproduct operations.

For coke oven doors, this requires a technical evaluation to identify new ways to reduce the number of already very low door leaks in order to comply with the new Coke Ovens Rule limits. This may include replacing door machines, rebuilding or replacing oven doors, and redesigning door-jamb cleaning mechanisms, or other currently unidentified means to control leaks around coke oven doors. For coke battery lids and offtakes, this requires research and trials on new ways to reduce leaks to comply with the revised limits. Control methods could include redesigning or replacing lids or developing different sealing materials.

None of the technologies needed to comply with these new standards are currently available or demonstrated in the coke byproduct recovery industry.

C. New MACT and Work Practice Standards for Coke Oven Pushing and Battery Stacks

The Coke Ovens Rule imposes numerous new MACT and work practice standards covering multiple hazardous air pollutants (HAP), which EPA claimed are in response to the D.C. Circuit decision in *Louisiana Environmental Action Network v. EPA* (*LEAN*), 955 F.3d 1088 (D.C. Cir. 2020). However, the technologies that would be needed to control these HAP are not available and have not been demonstrated to work for the coke byproduct recovery industry, either in the US or internationally.

The very short 18-month compliance period (i.e., January 5, 2026) in the Coke Ovens Rule is one-half the time allowed under the Clean Air Act and was based on EPA's incorrect and unsupported assumption that facilities would only need to do testing to confirm EPA's assumption that all coke facilities *can meet* the new MACT limits. EPA failed to address specific concerns and data submitted by commenters showing that facilities *cannot meet* the new standards without costly and undemonstrated control technologies. EPA also did not address data submitted by commenters showing raw material (i.e., coal) and process variability that affect emission performance, which make these limits unachievable without developing and installing novel emission control technology that is not commercially available.

As provided in numerous technical reports and declarations,[2] emission control technologies to achieve compliance with the PQBS emission limitations and coke oven leak rates and benzene action levels are not commercially available.[3] Even assuming that facilities are ultimately able to research and develop the new technologies needed to implement these new MACT standards, facilities need much longer than the 18-month compliance period under the Coke Ovens Rule. A Presidential Exemption is warranted for several reasons:

- The technologies used in some other industries to control these HAP have not been demonstrated to work in the coke byproduct recovery industry. Controlling multiple pollutants and retrofitting controls into existing equipment and operations adds technical and engineering complexity due to process interactions of the requirements for control, including pollutant interactions, flow rates, chemistry, and temperatures.

- The Coke Ovens Rule includes first-time emission limits for hydrogen cyanide (HCN); however, it is widely acknowledged that there are no existing technologies available to control HCN. Air pollution control vendors indicate that any potential solution for control of HCN is not technically feasible for coke battery combustion stack or pushing emissions.[4]

- The coke battery underfiring system is naturally drafted, with the underfire gas stream predominantly located underground. Added equipment such as heat exchangers, sorbent injection systems, etc., result in static pressure loss, necessitating installation of an induced draft fan. The impacts of added fans and equipment need to be studied to ensure adequate

[2] *See* ACCCI/COETF Petition for Reconsideration and Stay (Sept. 3, 2024); COETF Comments (Oct. 2, 2023); COETF Motion for Stay, filed Sept. 30, 2024, in *Am. Coke and Coal Chemicals Inst. and Coke Oven Env't Task Force v. U.S. EPA*, Case No. 24-1287 (D.C. Cir.) ("COETF Motion for Stay"); COETF Reply, filed November 5, 2024, in *Am. Coke and Coal Chemicals Inst. and Coke Oven Env't Task Force v. U.S. EPA*, Case No. 24-1287 (D.C. Cir.) ("COETF Reply") and associated exhibits/attachments.
[3] *Id.*
[4] *Id.*

ED_021114_00002885-00004

heating of the batteries have never been implemented for a by-product battery. Furthermore, enough physical space to install potential additional new equipment may not be feasible. This poses obstacles and engineering challenges for any new add-on equipment, which could include construction of a new battery combustion stack.[5]

- Changes to the underfiring system requires coke battery outages, during which purchased natural gas is needed to keep the battery hot. All coke production would cease; and battery refractory brick and other equipment could suffer unanticipated damage, which takes more time and expense to correct.

- Limited available physical space within coke oven battery areas requires vertical construction, adding complexity and time to all related construction, and may be infeasible altogether.

- Retrofitting additional controls on mobile pushing emission control devices involves unique engineering challenges compared to non-mobile sources, this type of retrofit is not commercially available.

III. An Exemption is in the National Security Interests of the United States

The impact of the Coke Rule is far-reaching and undermines U.S. national security interests given that metallurgical coke is an essential raw material input for the integrated iron and steel industry, which is an industry critical to national security interests of the U.S. The Coke Ovens Rule will have far-reaching consequences, given that the American iron and steel industry is the backbone of the nation's defense and transportation industries and is critical to national security. Steel is one of the most important building materials in America and an essential component for all types of buildings, transportation infrastructure, and military hardware. Currently, approximately 70% of steel produced globally is made using metallurgical coke, a high-quality fuel and reductant used in blast furnaces to separate iron from iron ore to make steel.[6] A strong, competitive coke and steel manufacturing industry is vital to building and maintaining critical infrastructure and military readiness.

The U.S. Department of Commerce recognized that domestic steel production is essential for national security applications which it indicated encompasses transportation systems, the electric power grid, water systems, and energy generation systems in its report summarizing the findings of an investigation conducted by the Department of Commerce pursuant to Section 232 of the Trade Expansion Act of 1962, as amended (19 U.S.C. § 1862 ("Section 232")), into the effect of imports of steel mill products ("steel") on the national security of the United States.[7] In a 2021 Congressional Research Service Report on U.S. Steel Manufacturing: National Security

[5] *Id.*

[6] See R. Nolan, *Build Back Better with America's Met Mines* (May 20, 2021) https://mma.org/2021/05/20/met-coal-steel-infrastructure

[7] See U.S. Department of Commerce Bureau of Industry and Security Office of Technology Evaluation, *The Effect of Imports of Steel on the National Security Report, Report by the January 11, 2018*, https://www.commerce.gov/sites/default/files/the_effect_of_imports_of_steel_on_the_national_security_-_with_redactions_-_publication.pdf

and Tariffs, it was noted that under the Defense Production Act, 50 U.S.C. §4533, "Congress provides the President with a broad set of authorities …, including Title III, which authorizes the use of economic incentives to secure domestic industrial capabilities essential to meet national defense and homeland security needs. DOD has funded several Title III projects to increase domestic production of steel products," including a $56 million agreement in 2020 to boost steel plate production signed by the predecessor owner of a Cliffs' facility.[8]

A Presidential Exemption would advance all of the following national security interests while EPA goes about reconsidering and revising the Coke Ovens Rule: (1) maintaining a strong domestic steelmaking industry; (2) avoiding regulatory mandates that lead to coke and steel shortages, offshoring of coke production, and resulting supply chain impacts; (3) promoting economic and job growth made possible by the coke and steel industries; and (4) avoiding wasteful commitments of resources on regulatory mandates that provide no discernable public health or environmental benefit.

Without a Presidential Exemption, the coke production industry would be faced with an estimated $1.3 billion in new capital costs, plus more than $220 million in annual operating costs. Coke facilities would be forced to install new, unproven pollution control technologies in an effort to comply with the new standards, even though compliance may not be feasible using available technology. The cost associated with the Coke Ovens Rule would substantially impact local and national economies and would undermine the coke and steel sectors' vital role in producing the iron and steel needed to support critical infrastructure, defense, and national security.

The importance of avoiding these harms to the coke and steel industry is emphasized in a December 6, 2023 letter from eight current and former U.S. Senators — including then-Senator JD Vance — to EPA warning that the Coke Ovens Rule and two other rules aimed at the steel sectors "… would dramatically undermine the domestic steel industry and national security while driving production overseas likely resulting in no net reduction in emissions from the steel industry globally."[9] Likewise, in a June 14, 2024 letter six current and former U.S. Senators — again including then-Senator Vance — urged EPA to reconsider the Coke Ovens Rule and two other rules aimed at the steel industry, warning that "… the steel industry will be forced to proceed with planning and spending for unproven technologies and work practices while the final provisions of the rules remain uncertain. Given that these regulations will impact nearly every aspect of the integrated iron and steelmaking process, it is imperative that EPA grant both the petitions for reconsideration and requests for stay of the rules."[10] Similar concerns were raised in a letter to EPA from Congress Members Crawford and Mrvan of the Congressional Steel Caucus.[11]

[8] Congressional Research Service Report, U.S. Steel Manufacturing: National Security and Tariffs (August 12, 2021), https://www.congress.gov/crs-product/IF11838.
[9] Letter from U.S. Senators Vance, Brown, Braun, Manchin, Casey, Klobuchar, Capito, and Young to Administrator Regan, p. 1 (Dec. 6, 2023).
[10] Letter from U.S. Senators Vance, Brown, Braun, Casey, Klobuchar, and Young to Administrator Regan, p. 2 (June 14, 2024).
[11] Letter from Congressmen Crawford and Mrvan to Administrator Regan, p. 1 (Dec. 18, 2023).

ED_021114_00002885-00006

The threat of global steel imports raised by the Senators in the letters to EPA is a material threat. Foreign steel imports risk the competitiveness and advancement of the domestic steel industry, to the point of potentially threatening U.S. domestic production capacity and continued investment in taconite iron mining, coke manufacturing, and iron and steelmaking capacity based on the costs outlined above. As emphasized by the U.S. Department of the Treasury's Committee on Foreign Investment in the United States ("CFIUS"), without such domestic steelmaking investment, there could be ripple effects on the supply chains that depend on such steel, particularly supply chains that are part of our national defense infrastructure such as "critical manufacturing, energy, transportation, and communications (all vital to national security)."[12] National defense infrastructure, for example, needs ready access to high purity steel from blast furnaces.[13] Once these complex iron and steel making operations are shut down and/or idled, it is no simple matter to restart them. In short: "The loss of domestic production is a critical national security concern given the ubiquitous nature of steel throughout multiple critical industries."[14]

IV. Conclusion

For all the reasons stated above, Cliffs urges the issuance of a 2-year exemption from the compliance deadlines in the Coke Ovens Rule, pending EPA's review of the rule.

Thank you for your consideration of this Presidential Exemption request. If additional information is needed, please contact Walter Tamukong at walter.tamukong@clevelandcliffs.com or 216-649-4862.

Sincerely,

Traci L. Forrester

CLIFFS

CLEVELAND-CLIFFS INC

March 31, 2025

U.S. Environmental Protection Agency
1200 Pennsylvania Ave., NW
Washington, DC 20460
Submitted by Electronic Mail to: airaction@epa.gov

RE: REQUEST FOR PRESIDENTIAL EXEMPTION from "National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review" (89 FR 23294; April 3, 2024) on Behalf of Cleveland-Cliffs Inc. Integrated Iron and Steel Manufacturing Facilities[1]

Pursuant to Section 112(i)(4) of the Clean Air Act ("CAA"), Cleveland-Cliffs Inc. ("Cliffs") hereby requests that the President issue a two-year exemption from the compliance deadlines for emission limits and work practice standards promulgated in the final rule *"National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Technology Review"* (the "II&S Rule"), published in the *Federal Register* at 89 Fed. Reg. 23,294 (April 3, 2024). This request encompasses extending the compliance dates by two years for each of Cliffs' integrated iron and steel manufacturing ("II&S") plants subject to the rule, pending EPA's reconsideration of the II&S Rule. Cliffs and the American Iron & Steel Institute ("AISI") submitted several rounds of extensive comments and scientific data and analysis on the II&S Rule.

Cliffs is a leading North America-based steel producer and owns five of the eight II&S facilities in the United States (the other three are operated by a separate steel company, which will submit a separate request). Cliffs' facilities include Burns Harbor and Indiana Harbor East and West in Indiana, Cleveland Works and Middletown Works in Ohio, and Dearborn Works in Michigan.

This request explains why an exemption is appropriate for Cliffs' sources impacted by the II&S Rule, because, as specified in section CAA §112(i)(4), the technologies to implement the standards are not available and an exemption is in the national security interests of the United States.

[1] Cleveland-Cliffs Inc. Facilities: Cleveland-Cliffs Burns Harbor Inc.; Cleveland-Cliffs Cleveland Works LLC; Cleveland-Cliffs Steel Corp. Dearborn Works; Cleveland-Cliffs Steel LLC-Indian Harbor East and West; Cleveland-Cliffs Holdings Corp. Middletown Works.

A. BACKGROUND

EPA first promulgated the NESHAPs for the II&S industry pursuant to CAA §112(d) on May 20, 2003, 68 Fed. Reg. 27,646, establishing emissions limitations for HAPs emitted from new and existing sinter/recycling plants, blast furnaces ("BFs"), and basic oxygen process furnace ("BOPF") shops. This rulemaking required all sources to meet HAP emission standards through application of maximum achievable control technology ("MACT"). It included particulate matter emissions limitations and opacity limits for capture systems and control devices. EPA found that "[p]articulate matter and opacity serve as surrogate measures of HAP emissions."[2]

In 2020, the Trump EPA issued a final rule for the II&S source category to fulfill its obligations under CAA sections 112(d)(6) and (f)(2), known as the "risk and technology review" ("RTR"). The 2020 II&S RTR Rule concluded that the original 2003 II&S Rule addressed the risk from hazardous air pollutants with an adequate margin of safety to public health, and that there were no new technologies that justified revisions to the 2003 MACT standards under CAA §112(d)(6).[3]

On April 3, 2024, the Biden EPA promulgated the II&S Rule, revising the Trump EPA's 2020 RTR rulemaking for the II&S source category. The Agency maintains in the 2024 II&S Rule that the residual risk to human health and environment from the II&S source category continues to be acceptable within an ample margin of safety, based on its analysis in the 2020 RTR.[4]

As to the technology review under CAA section 112(d)(6), however, the 2024 II&S Rule establishes new hazardous air pollutant ("HAP") emissions limits at Sinter/Recycling plants (polycyclic aromatic hydrocarbon, carbonyl sulfide, mercury, hydrochloric acid, dioxin/furan toxicity equivalence), BOPFs (total hydrocarbons, hydrochloric acid, dioxin/furan toxicity equivalence), BF stoves (total hydrocarbon, hydrochloric acid), and BF casthouses (total hydrocarbon, hydrochloric acid); and new standards, in the form of opacity limits, operating limits, and work practice standards, for five Unmeasurable Fugitive Intermittent Particulate ("UFIP") sources (unplanned bleeder valve openings; planned bleeder valve openings; small and large bell leaks; iron beaching; and slag processing, handling and storage operations) based on the flawed conclusion that no new technology is required to meet these standards.

EPA justified the slew of new HAP emissions limitations and UFIP source standards based purportedly on a new technology review. Relying on an aggressive interpretation of the D.C. Circuit's decision in *Louisiana Environmental Action Network v. EPA* ("*LEAN*"), 955 F.3d 1088 (D.C. Cir. 2020), the Biden EPA unlawfully and erroneously established new emission limits and work practice standards without consideration of the underlying CAA §112(d) obligation to only "revise as necessary (taking into account developments in practices, processes, and control technologies)." The record does not support the Biden EPA's new technology review and resulting II&S Rule standards. As the Trump EPA had properly concluded in 2020, there is no demonstrated technically feasible or economically reasonable technology that II&S facilities can use to meet the

[2] *Id.* at 27,467.
[3] 85 Fed. Reg. 42,074, 42,074 (July 13, 2020).
[4] *Id.* at 23,312.

new standards in the II&S Rule. Instead, the Biden EPA reached an unsupported conclusion that no new technologies would be necessary to comply with the new standards. This conclusion ignores the plethora of data in the record demonstrating that the standards are unachievable by even the best performing sources, in contravention of the CAA. The II&S Rule require the development and implementation of unproven control equipment that has never been applied in the II&S industry domestically or internationally.

Cliffs filed a petition for judicial review of the final II&S Rule in the D.C. Circuit and a petition for administrative reconsideration and stay of the rule with EPA. A request for judicial stay of the II&S Rule was denied on October 24, 2024, by the D.C. Circuit Court of Appeals after being opposed by the Biden EPA. EPA sent a letter on August 14, 2024, which was supplemented by a letter on March 5, 2025, to those including Cliffs who had submitted administrative petitions for reconsideration on the II&S Rule, announcing its intent to reconsider the Rule. On March 7, 2025, the Trump EPA moved to hold the II&S appeals in abeyance for at least 120 days pending its reconsideration. On March 12, 2025, the EPA Administrator also announced the Agency's intention broadly to reconsider a group of rules establishing or modifying various National Emission Standards for Hazardous Air Pollutants ("NESHAP") including the II&S Rule. On March 31, 2025, EPA issued a temporary stay of the II&S Rule pursuant to section 307(d)(7)(B) of the CAA requirements for 90 days. Cliffs strongly supports EPA's plan to reconsider the II&S Rule for the numerous legal and technical reasons previously raised in industry comments during the notice and comment period preceding the II&S Rule, in Cliffs' lawsuit, and in Cliffs' petition for reconsideration.

EPA further indicated that the President was considering issuing exemptions from compliance dates under CAA §112(i)(4) where appropriate, and that affected sources should provide requests for such exemptions to EPA by March 31, 2025. Cliffs is timely submitting such request herein.

B. NO TECHNICALY FEASIBLE OR COST-EFFECTIVE TECHNOLOGY IS AVAILABLE TO IMPLEMENT THE 2024 II&S RULE

No technically feasible or cost-effective technology is available, or could be available, to implement the standards established in the 2024 II&S Rule. The rule places emission limitations on (1) HAPs and (2) opacity limitations and work practice standards on UFIP sources. These limitations and work practice standards are not feasible to meet due to a lack of technology and flawed implementation of the rulemaking that shows a lack of understanding of the sources in question. Cliffs provided detailed comments explaining why EPA should decline to set new standards, or in the alternative, should set standards that were reasonable, less costly and more likely achievable by the industry. Nevertheless, the Biden EPA promulgated the final II&S Rule imposing onerous, unreasonable and extremely costly standards.

1. Technology to Implement the Hazardous Air Pollutant Emission Standards is Not Feasible

Cliffs has provided numerous technical reports and declarations[5] evidencing that new HAP limitations in the II&S Rule for the Cliffs' facilities listed above are unachievable and require development and installation of unproven control technologies and/or retrofitting that have never been installed domestically or internationally for these sources because the technologies are not available and have not been demonstrated in practice. The II&S Rule fails to consider that not only is this untested technology, but that the facilities also require time for development, trialing, design, procurement, fabrication, and testing to ensure the technology could even achieve its intended purpose. As one industry engineering expert notes: "Typical capital project delivery steps for a major emission control project of this scale typically require 2 – 3 years to implement. The research and development required to conceive of, test and validate a novel solution which does not exist today could easily add another 2-3 years to this typical implementation timeline, provided that a solution is identified."[6]

The affected sources and specific issues with the feasibility of HAP emission limit control technologies are summarized as follows:[7]

- **BOPFs:** Together, the five Cliffs' facilities have fifteen (15) BOPF furnaces, and there is no existing emission control system that can be added to a BOPF furnace that is known to address dioxin/furan, total hydrocarbons, or hydrogen chloride to meet the limits provided in the 2024 II&S Rule. Addressing HAPs for BOPF furnaces will require significant retrofit upgrades to the current systems, the extent of which will depend on whether there is dry electrostatic precipitator or wet scrubber technology already in place. These system upgrades are expected to be particularly challenging, given they will likely need to incorporate (or in the case of wet scrubbers, completely replace with) novel treatment technology such as a recirculating baghouse system with injected lime and/or carbon, which are not commercially available.

- **BF Casthouses:** Together, the five Cliffs' facilities have seven (7) BF casthouses, and there is no existing add-on emission control that is proven to meet the HAP limitations for hydrogen chloride or total hydrocarbons. Moving forward with the limits in the rulemaking

---

ED_021114_00002885-00011

will require application of novel treatments such as carbon lime and/or bicarbonate injection systems, which are not commercially available.

- **BF Stoves:** Together, the five Cliffs' facilities have seven (7) clusters of BF stoves, and there is no existing add-on emission control that is proven to meet the HAP limitations for hydrogen chloride or total hydrocarbons. Moving forward with the limits in the rulemaking will require application of novel treatments such as carbon lime and/or bicarbonate injection systems that are not commercially available.

- **Sinter Recycling Plants**: One Cliffs' facility, Burns Harbor, has a sinter recycling plant with a wet scrubber. This plant would need to install a new sinter plant windbox emission control system paired with activated carbon injection ("ACI") to meet the new standards. A fatal flaw, however, is that use of ACI is not actually feasible as an add-on control because there is not sufficient residence time for contact with the carbon and absorbing material (in this case, mercury, dioxin/furan, and/or polycyclic aromatic hydrocarbons). The technology of ACI is primarily intended for use with recirculating baghouses and the effects when paired with a wet scrubber are unclear and may include negative consequences such as unintended localized emissions and significant carbon waste generation in the resulting sludge.

As noted above and in more detail with our numerous technical reports and declarations[8], the II&S Rule "will require development and installation of unproven control technologies that have never been installed domestically or internationally for these source categories."[9] Cliffs must evaluate, develop, trial, permit, design, procure, fabricate, and install novel technology and emission control systems. This industry specific technology which may or may not achieve the standards in the end needs to be developed for the first time.[10] EPA's erroneous assumptions about the transfer of control technology demonstrate a poor understanding of this industry sector and warrant time for thorough reconsideration. A Presidential exemption is important to achieve this extended timeline.

2. Technology to Implement UFIP Standards Is Not Feasible

For the UFIP sources, the opacity limitations and work practice standards are so fundamentally flawed that there is no existing technology capable of complying with the Rule. In order to meet the UFIP standards, experts have opined that "[s]ources unable to achieve compliance with the final standards may require the development and implementation of control equipment or control measures that has never been applied in the II&S industry."[11] Cliffs submitted

data demonstrating that even the best performing sources are not able to continuously achieve the new limits. [12] In addition, new limits set by the Rule, even assuming technology existed, pose safety dangers in the facilities in direct conflict with the CAA's General Duty Clause in Section 112(r).

The affected sources and specific UFIP control feasibility issues are summarized as follows:

- **Unplanned Bleeder Valve Openings:** Bleeder valves are emergency release devices that relieve pressure from a BF to prevent explosions or other catastrophic events. EPA took the extraordinary step of attempting to set numeric limits on the unplanned opening of bleeder valves, pitting environmental compliance against worker health and safety, by discouraging valve opening, in direct conflict with the stated intent of Congress (H.R. 101-490, Part 1 (328)). However, technical data demonstrates that three of four MACT Floor (or "best performing") sources for large BFs cannot achieve this limitation and are therefore unachievable without adding control equipment.[13] Specifically, bleeder valves are intended to reduce the risk of catastrophic overpressure conditions in a BF. Not only are the limits unachievable, but experts have explained that the work practice standards "prescribes technologies that may not result in the reduction of valve openings or may be infeasible on certain BF units."[14] Moving forward with the limits in the rulemaking will require the application of control equipment which is not commercially available.

- **Planned Bleeder Valve Openings:** Not only are the standards unrepresentative of the data, but the calculation of the opacity standard for planned bleeder valve openings used a calculation method that did not adequately account for the underlying long-term operational variability. This incorrect calculation directly resulted in three of the five MACT Floor sources for Blast Furnaces being unable to achieve this limitation.[15] Moving forward with the limits in the rulemaking will require the application of control equipment which is not commercially available.

- **Iron Beaching:** Emissions generated by the transfer and pouring of hot molten iron (beaching) are not only de minimis in nature but were already adequately controlled by existing work practices that require flexibility in approach given the spacing and safety limitations based on different facility configurations. EPA's proposed technologies include "infeasible (and unsafe) enclosure of beaching operations and/or installation of CO2 suppression."[16] This is particularly the case where [t]he installation of enclosures would be infeasible at facilities with space limitations," such as four of the eight facilities with such limited space that the "retrofit construction of an enclosure [is] virtually impossible."

[15] *Id.* at 7.
[16] *Id.*

- **Small and Large Bells**: Bells are part of the charging system on top of the BF that allows for materials to be loaded into the furnace or next bell (as in the case of small bells) without letting BF gas escape). Every furnace, and its corresponding bells are unique in "age, size, design, air flow, raw material usage, and production specification."[17] Additionally, "[e]very bell top campaign is unique, and both small and large bell replacements and repairs (depending on the repair required) are large capital projects that require indefinite lead times for equipment design, project planning (i.e., engineering, safety protocols, and logistical coordination) and corporate approval and funding authorizations for capital expenditures",[18] making the short timeframe for taking action in the II&S Rule technically infeasible.

- **Slag Processing, Handling and Storage**: New opacity limits for slag processing, handling, and storage operations relied on a dataset that did not represent all categories of operations ultimately regulated by the II&S Rule. The resulting limits are unachievable by the best performing sources and fail to adequately account for variability across the different types of processes that EPA attempted to capture with a single opacity limit. Further, the II&S Rule's restrictions on slag operations may require design controls (e.g., enclosures) that create unsafe operating conditions given slag can be highly reactive, especially in contained areas.[19] As discussed in the Declaration of Charles Ochola, President of the National Slag Association, "one of the direct results of using water to control emissions is the creation of pooled water. Standing water associated with emission controls, nature, or any source creates an extremely hazardous condition anywhere molten slag is managed. Pouring molten slag into the smallest puddle of water will create a reaction very similar to an explosion, putting operators and the community at risk for serious if not deadly injury … The use of emission controls that rely upon water are limited by the extreme hazard caused from adding molten slag, iron or steel to standing water."[20]

A Presidential exemption is warranted here, where safe and technically feasible control technology is not available to implement the standard.

3. Technology to Implement the II&S Rule Standards Is Not Cost Effective

Due to the II&S Rule's onerous implementation and compliance schedule for these standards, Cliffs is in an impossible position of designing and engineering novel systems with unproven technology within a short time frame. The cost of compliance is disproportionately high and the amount of work leading up to the compliance date is enormous.

Even EPA's March 12, 2025, Fact Sheet supporting reconsideration of multiple NESHAP rules including the II&S Rule grossly understated costs to comply, citing "[e]stimated costs of $45 million over the next decade (including $7.1 million in capital investment or $5.3 million

[17] *Id.* at p. VI-32.
[18] *Id.* at p. VI-35.
[19] Declaration of Mike Remsberg of Trinity Consultants, p. 8 (June 18, 2024) (attached as Exhibit D to Cliffs' Motion for Stay.)
[20] Declaration of Charles Ochola, President of the National Slag Association (May 31, 2024) (Attachment E to Cliffs' Reconsideration Petition).

annually)."[21] In reality, "[d]ue to the high variability of the process and raw materials, if all facilities required installation of new emission control equipment," industry "estimated initial costs to achieve compliance with the new gap filling HAP limits will be approximately $3.2 billion in capital investment and $749 million annually going forward."[22] For the Cliffs' Burns Harbor Sinter/Recycling Plant alone, the corrected average cost effectiveness for application of control technology "is more than $500,000 per *gram* of dioxin furan controlled, or $237.3 million per pound controlled. This is without considering prior industry comments regarding US EPA's underestimation of control costs, which would only serve to increase the cost per mass controlled."[23]

Similarly, industry estimates for UFIP removal placed annual costs at $290 million per year, with a cost-effectiveness rate of $819 million per ton of HAP removed.[24] For unplanned bleeder valve openings alone, the cost effectiveness rate is $1.3 million per ton of HAP removed (using corrected EPA data) or even potentially $10 million per ton of HAP removed (using industry data).[25] Further, EPA failed to correct erroneous HAP emissions, resulting in overstated HAP emissions and inflated benefits. Reductions in HAPs for bells is so small, at barely 100 pounds for 15 BFs, that there is no estimate that makes this cost-effective. Reductions in HAPs for beaching is likewise not meaningful given how infrequently beaching occurs and industry estimates ranging in reduction of only 5 to 20 pounds per year across all eight II&S facilities.

As noted above, EPA's own risk assessment showed that even without controls, emissions from the industry presented an acceptable level of risk with an ample margin of safety. As a result, any costs expended to meet these standards are unreasonable, and, by definition, not cost-effective.

C. IT IS IN THE NATIONAL SECURITY INTERESTS OF THE UNITED STATES TO PROVIDE AN EXEMPTION FROM THE II&S RULE COMPLIANCE DATES

The II&S Rule will have far-reaching consequences, given that the American iron and steel industry is the backbone of the nation's defense and transportation industries and is critical to national security. The U.S. Department of Commerce recognized that domestic steel production is essential for national security applications which it indicated encompasses transportation systems, the electric power grid, water systems, and energy generation systems in its report summarizing the findings of an investigation conducted by the Department of Commerce pursuant to Section 232 of the Trade Expansion Act of 1962, as amended (19 U.S.C. § 1862 ("Section 232")), into the effect of imports of steel mill products ("steel") on the national security of the United States.[26] In a 2021, Congressional Research Service Report on U.S. Steel Manufacturing:

ED_021114_00002885-00015

National Security and Tariffs, it was noted that under the Defense Production Act, 50 U.S.C. §4533, "Congress provides the President with a broad set of authorities …, including Title III, which authorizes the use of economic incentives to secure domestic industrial capabilities essential to meet national defense and homeland security needs. DOD has funded several Title III projects to increase domestic production of steel products," including a $56 million agreement in 2020 to boost steel plate production signed by the predecessor owner of a Cliffs' facility.[27]

The II&S Rule, if implemented, would both increase the cost of producing steel and the products derived therefrom. This would have a negative impact on multiple other industries and activities, harming the national security interests of the United States. Ensuring the strength and global competitiveness of this industry is of vital importance to the nation's economy, security, and manufacturing prowess. Supporting this is the fact the industry provides more than **$520 billion** in economic output, nearly **two million jobs,** more than **$130 billion in wages and benefits** to employees, and **$56 billion in federal, state and local taxes**. Cliffs alone employs approximately 27,000 people, most of whom are members of unions such as the United Steelworkers and the International Association of Machinists and Aerospace workers.

The American iron and steel industry is already among the most regulated and cleanest steel industries in the world. Rulemaking must take into consideration the necessary role that the domestic integrated iron and steel industry plays in our country. Members of Congress have already expressed their concern on this rulemaking. Eight current or former U.S. Senators (Senators Brown, Vance, Braun, Manchin, Casey, Klobuchar, Capito and Young) wrote a letter to EPA warning the Agency that its three proposed rules aimed at the steel industry – impacting taconite iron ore processing, coke manufacturing, and integrated iron and steelmaking – "would dramatically undermine the domestic steel industry and national security while driving production overseas …."[28] Similarly, Congressmen Crawford and Mrvan, Chair and Vice-Chair of the Congressional Steel Caucus, respectively, wrote a letter to then EPA Administrator Regan, expressing their concerns over the proposed rulemakings targeting the steel industry, concluding that the rulemakings, including the II&S Rule, would threaten advancements already made by the industry into environmental initiatives while "pos[ing] a threat to the competitiveness of steel producers and tens of thousands of good-paying union jobs."[29]

The II&S Rule could further "diminish the ability of the American steel industry to meet the demands of our economy" which may lead to those demands being met by "foreign made and illegal subsidized steel entities that do not meet our current environmental, labor, and accountability standards." These fears ring true, as the U.S. Department of Commerce has already found excessive quantities of imports displacing domestic steel – steel that is not produced as clean as in the United States. Such a result is counterintuitive to the purpose of the CAA and threatens the nation's domestic steelmaking supply chain. The Congressmen conclude in their letter by "strongly

ED_021114_00002885-00016

encourage[ing]" EPA to communicate with "industry experts and other stakeholders" and ensure that the final rulemakings are "technically feasible, financially reasonable, and continue to protect the livelihoods, health, and safety of workers and steel-producing communities throughout our nation." That is exactly what this Administration is doing by providing outreach in the form of a Presidential Exemption, and we ask that you consider this request on its merits.

The threat of global steel imports raised by the Senators in the letters to EPA is a material threat. Foreign steel imports risk the competitiveness and advancement of the domestic steel industry, to the point of potentially threatening U.S. domestic production capacity and continued investment in taconite iron mining, coke manufacturing, and iron and steelmaking capacity based on the costs outlined above. As emphasized by the U.S. Department of the Treasury's Committee on Foreign Investment in the United States ("CFIUS"), without such domestic steelmaking investment, there could be ripple effects on the supply chains that depend on such steel, particularly supply chains that are part of our national defense infrastructure such as "critical manufacturing, energy, transportation, and communications (all vital to national security)."[30] National defense infrastructure, for example, needs ready access to high purity steel from blast furnaces.[31] Once these complicated iron and steel making operations are shut down and/or idled, it is no simple matter to restart them. In short: "The loss of domestic production is a critical national security concern given the ubiquitous nature of steel throughout multiple critical industries."[32]

For all the reasons stated above, Cliffs urges the issuance of a two-year exemption from the compliance deadlines in the final II&S Rule, pending EPA's review of the rule for possible revision. If you have questions or need additional information, please contact Walter Tamukong at 216-694-4862 or at walter.tamukong@clevelandcliffs.com.

United States Senate

WASHINGTON, DC 20510

December 6, 2023

The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

We write to you today regarding the U.S. Environmental Protection Agency's (EPA) three proposed rules related to steel manufacturing and related supply chains. We have serious concerns with these proposed rules because they would dramatically undermine the domestic steel industry and national security while driving production overseas likely resulting in no net reduction in emissions from the steel industry globally. Reducing the emission of harmful air pollutants should be done based upon sound science and with proven technology that is both technically and economically feasible. The irony is that the United States' steel industry is world's cleanest major producer of steel[1]. American steel manufacturers take seriously their commitment to protecting the environment; however, rules that drive production overseas are bad for our economy, bad for national security, and bad for the environment.

These rules:

1) National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-EPA-OAR-2002-0083), 2) National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries. (EPA HQ OAR 2002 0085 and EPA HQ OAR 2003 0051), and 3) National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments (EPA-HQ-OAR-2017-0664), if finalized as proposed, would require billions of dollars in capital investments and increased annual operating costs for the U.S. steel industry.

We support reducing harmful air pollution. We also support rules that are durable, realistic, and based upon proven technology and reflect a consensus view among stakeholders on how to best improve public health while protecting good paying jobs and supporting industries essential to our national and economic security. These rules fail to meet those standards.

As you move forward with these rulemakings, we urge you to take an inclusive approach – working directly with major stakeholders in developing technically-sound final rules that achieve further emissions reductions while not harming the competitiveness of our American steel companies. Written properly, regulations can help American steel manufacturers lead the world in clean steel production. Poorly written rules undermine domestic manufacturing and promote reliance upon inputs made by foreign manufacturers manufacturers that pollute more than their American counterparts. Regulations that cost

[1] "Steel Climate Impact - An International Benchmarking of Energy and CO_2 Intensities." Found at: https://www.bluegreenalliance.org/wp-content/uploads/2022/04/Steelclimateimpact-benchmarkingreport7April2022.pdf

American jobs, undermine national security, and are likely to result in no net reduction in emissions globally must be rejected.

Sincerely,

Sherrod Brown
United States Senator

J.D. Vance
United States Senator

Todd Young
United States Senator

United States Senate

WASHINGTON, DC 20510

June 14, 2024

The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

We write to you today regarding three U.S. Environmental Protection Agency (EPA) rules that together threaten the economic competitiveness of the American integrated steel industry. We urge EPA to grant the petitions filed by the domestic integrated steel industry seeking administrative reconsiderations and stays of all three final rules until the EPA can complete a comprehensive review of each rule through the administrative reconsideration process.

Working together, EPA and industry have achieved notable reductions in environmental impacts to air, water, and land over the past 50 years. The steel industry in the U.S. is the world's cleanest major producer of steel and is already subject to more environmental regulation than its global competitors, resulting in a cleaner environment. While we appreciate EPA's efforts to address concerns raised by multiple stakeholders – including steel companies, the United Steelworkers (USW), coke producers, and numerous Members of Congress – throughout the rulemaking process, we remain concerned that the final rules contain flaws that will undermine the domestic steel industry and national security while driving production overseas. We are specifically concerned about the following three rules:

- National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing (EPA-HQ-OAR-2017-0664)
- National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-OAR-2002-0083)
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries (EPA–HQ–OAR–2002–0085 and EPA HQ OAR 2003 0051).

A failure to get these regulations right will not only have a negative impact on domestic steel production and American steelworkers, but it will also likely fail to achieve a net reduction in emissions from the steel industry globally. In fact, emissions will likely rise as production moves to countries, like China, with far less stringent rules and regulations. By granting the requested administrative reconsideration and stay of the rules, the EPA and industry can build on their shared track record of success and continue to work together in a constructive manner to achieve durable rules that both protect the environment and our domestic integrated steel industry.

Throughout the rulemaking process, EPA worked to address technical and analytical flaws with these rules raised by multiple stakeholders. The modifications incorporated into the final rules in response to stakeholder feedback were important steps in the right direction, but we remain concerned they did not go far enough in addressing fundamental flaws with the rules. Further modifications are needed to address new information provided to EPA by stakeholders to ensure the rules are achievable by the industry, as required by the Clean Air Act, and that the regulations do not induce unintended consequences, such as loss of domestic steelmaking capacity and jobs. Given all that is at stake in terms of our country's advanced steel manufacturing capabilities and the good-paying, middle class union jobs the steel industry sustains, it is critically important that these rules are technically and economically feasible and do not undermine the competitiveness of the industry.

A stay of these rules will allow EPA to continue to work with industry stakeholders, including domestic companies and the USW, to obtain a complete and thorough understanding of the new information, equipment, and processes and ensure regulations moving forward are sound policy. Absent a stay, the steel industry will be forced to proceed with planning and spending for unproven technologies and work practices while the final provisions of the rules remain uncertain. Given that these regulations will impact nearly every aspect of the integrated iron and steelmaking process, it is imperative that EPA grant both the petitions for reconsideration and requests for stay of the rules.

We urge EPA to grant the industry's petitions for reconsideration and stay requests to ensure that these regulations both safeguard our environment and preserve production capacity and jobs in our strategically important integrated iron and steel sector. Thank you for your work to date with us on these important matters.

Sincerely,

Sherrod Brown
United States Senator

Mike Braun
United States Senator

Robert P. Casey, Jr.
United States Senator

J.D. Vance
United States Senator

Amy Klobuchar
United States Senator

Todd Young
United States Senator

cc: Janet McCabe, Deputy Administrator, U.S. Environmental Protection Agency

Congress of the United States
House of Representatives
Washington, DC 20515

December 18, 2023

The Honorable Michael S. Regan
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Dear Administrator Regan:

As Chairman and Vice Chairman of the Congressional Steel Caucus, we write to express our concerns regarding the proposed rules below from the U.S. Environmental Protection Agency (EPA):

- National Emission Standards for Hazardous Air Pollutants: National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing Amendments (EPA-HQ-OAR-2017-0664)
- Integrated Iron and Steel Manufacturing Facilities (EPA-HQ-EPA-OAR-2002-0083)
- National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks, and Coke Oven Batteries (EPA–HQ–OAR–2002–0085 and EPA– HQ–OAR–2003–0051).

The American steel industry and its manufacturing workforce produces the world's cleanest steel, made possible by years of substantial investments into climate initiatives. According to the American Iron and Steel Institute, the steel industry has reduced its energy intensity per ton of production by 35 percent and carbon dioxide emissions intensity by 37 percent in the past three decades. We also would highlight that these efforts will continue to be augmented by research and technology investments being made under current law.

We are grateful for your efforts to assist in the implementation of these laws and want to ensure that the proposed rules do not hinder the ability of the American steel industry to make robust investments into these important environmental initiatives.

Industry leaders have shared with us that these rules, as drafted, pose a threat to the competitiveness of steel producers and tens of thousands of good-paying union jobs. Our understanding is that these rules do not consider current technology capabilities and economic feasibility and may jeopardize the industry's ability to meet other environmental initiatives and health requirements for workers. We also are concerned that any action to diminish the ability of the American steel industry to meet the demands of our economy will be manufactured by

foreign-made and illegally subsidized steel entities that do not meet our current environmental, labor, and accountability standards.

As you move forward, we would strongly encourage you to more openly communicate with steel industry experts and other stakeholders to ensure that proposed requirements are based on proven technology and robust scientific data. It is essential to ensure that proposed rules are technically feasible, financially reasonable, and continue protecting the livelihoods, health, and safety of workers and steel-producing communities throughout our nation.

Sincerely,

Eric A. "Rick" Crawford
Member of Congress
Chair, Congressional Steel Caucus

Frank Mrvan
Member of Congress
Vice-Chair, Congressional Steel Caucus

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Hi Chloe and Demarion,

I hope you're both doing well! Wanted to see if we could set up a quick call to discuss the implementation of *National Emission Standards for Hazardous Air Pollutants: Lime Manufacturing Plants Technology Review*. Specifically, a potential two-year exemption to allow implementation technology to be developed. I have attached a letter on the topic for background.

Would you have time this week to hop on a quick call to discuss? My direct line is 202-228-6382.

Please advise if this request would be better suited elsewhere.

Best,
Bennett Lyday | Legislative Correspondent
Office of U.S. Senator Eric Schmitt (R-MO)

Bennett_Lyday@Schmitt.Senate.Gov

ERIC SCHMITT

LIME

NATIONAL LIME ASSOCIATION

December 2, 2025

Mr. Marc Marie
Deputy Chief of Staff for Policy
The White House
1600 Pennsylvania Avenue, N.W.
Washington, D.C. 20500

Dear Mr. Marie:

This letter follows up on the National Lime Association's March 28, 2025, request for a two-year Presidential Exemption to extend the compliance date for the Environmental Protection Agency (EPA) rule titled: *National Emission Standards for Hazardous Air Pollutants: Lime Manufacturing Plants Technology Review*, 89 Fed. Reg. 57,738 (July 16, 2024) until July 16, 2029. We are resubmitting our March 28th request, along with this letter that provides additional information for White House consideration.

The President should issue a two-year Presidential exemption from the EPA lime rule because the technology to implement the standard is not available in the timeframe allowed, and an exemption is clearly in the national security interest of the United States. In addition, failure to grant the two-year exemption will impose significant costs on the lime industry.

EPA's rulemaking record shows that this rule is extremely expensive, unnecessary for protecting human health and the environment, and provides, in EPA's own words, no quantifiable monetary benefits. EPA's own analysis demonstrated that:

(1) Costs between $2-2.4 billion (compared to lime's $2.3 billion annual revenues);
(2) Existing hazardous air pollutant emissions are currently acceptable with an ample margin of safety to protect public health;
(3) These unproven, more stringent standards were not necessary to prevent adverse environmental effects;
(4) There were no developments in practices, processes, or control technologies that would warrant revisions to the standards; and
(5) The agency was unable to show any monetized benefits of the rule.

For these reasons, EPA notified our members earlier this year that the agency is planning to reconsider the lime rule:

ED_021114_00003344-00001

> Although EPA previously determined that the issues raised in your petition do not meet the requirements for mandatory reconsideration under section 307(d)(7)(B) of the [Clean Air Act], the EPA is exercising its discretion to voluntarily reconsider the Final Rule. In doing so, the EPA intends to issue a *Federal Register* notice initiating public review and comment on some or all of the issues raised in your petition. The EPA expects to take final action in the spring of 2026.

See Letter from Abigale Tardif, Principal Deputy Administrator, Office of Air & Radiation to David Friedland (April 11, 2025, copy attached). David Friedland is with Beverage & Diamond and represents the National Lime Association (NLA) as outside counsel.

Unavailability of Technology

NLA explained in our March 28th petition the difficulties with implementing technologies in the lime industry for each individual hazardous air pollutant (HAP), as well as the complications of treating them simultaneously. In addition, the technologies identified by EPA to meet the standards are entirely new to the lime industry and have not been historically used to treat emissions from lime plants. *See NLA Request for Presidential Exemption* (March 28, 2025) at pp. 3-8 (attached). Since that time, we have learned that NLA members face significant challenges in designing, procuring, installing, testing, and beginning operation of such equipment in time to meet the compliance deadline. In some cases, companies will attempt to reclassify their lime plants as area sources because the EPA lime rule applies only to major source lime plants. However, even a reclassification compliance strategy involves significant commitments of time and resources, including engineering, planning, capital expenditures, and time to install and test equipment to reduce HCl emissions below the major source threshold of 10 tons of emissions per year.

The effective compliance date for the EPA lime rule is January 16, 2027. This is because the EPA lime rule contains a provision requiring submission of stack test data and plans for any companies that will use "averaging" of HAP emissions across various kilns for HCl and mercury emissions at least 180 days before the actual compliance date (July 16, 2027). *See* 40 C.F.R. § 63.7114 (e)(2)(requiring development and submission of an implementation plan and stack testing 180 days before the compliance date); 89 Fed. Reg. 57,755 (July 16, 2024). Accordingly, lime plants now have just over one year until the legal requirements of the rule commence.

The lime industry appreciates EPA's decision to reconsider the lime rule on an expedited basis. NLA members have relied in good faith on that decision and have been working with the agency to address the issues with the rule so that they can be meaningfully addressed as part of the reconsideration. Because of this and the planned changes to the rule, lime plants have not spent millions of dollars on equipment and upgrades that will become superfluous following the reconsideration. However, due to several factors, including EPA needing to prioritize regulations of other industries before lime's reconsideration, and the lengthy government shutdown, EPA likely will not be able to complete the lime rule reconsideration before the compliance deadline. Accordingly, at this time, it is too late for many lime manufacturing facilities to meet the January 2027 deadline without a Presidential exemption.

For example, one lime producer reports they may not have sufficient electrical power available at their site to comply with the regulation. They have initiated a preliminary engineering electrical plant-wide load study to account for additional process equipment that may need to be installed

ED_021114_00003344-00002

to ensure MACT compliance. This engineering load study is the precursor to a detailed incoming power load study by the electric utility company to determine if the incoming power is sufficient to handle additional load, further stressing the local electrical grid. The load study is anticipated to take 6 months.

Upon completion, a detailed engineering design will need to be conducted to select the additional electrical infrastructure equipment needed to support the various additional equipment. It is anticipated that the detailed engineering study will require a new substation grade transformer and switchgear, both highly custom equipment, with a current lead time of 60 weeks for the transformer and 75 weeks for the switchgear. Due to the lead times for the electrical equipment and the numerous load studies, the completion date of anticipated plant-wide electrical infrastructure upgrades that would need to be installed to support additional equipment under the current Lime MACT rule would be sometime towards the end of 2027, too late for meeting the lime rule compliance deadline. Extending the compliance deadline is a necessity to ensure ample time to conduct the required electrical load studies and procure the required electrical infrastructure to power additional process equipment at their plant.

Other companies face even more significant challenges. For plants that require regenerative thermal oxidizer (RTO) technology, they must be able to access supplies of natural gas in order to use that technology. One member explains that they do not have gas available at their plant. In order to supply gas to their location, it would require the construction of an eight-mile natural gas pipeline across a national forest. The engineering, permitting, and construction of such a project could not possibly be completed before the 2027 compliance date.

A Presidential exemption is necessary and appropriate for the lime industry because the technology to comply with the lime rule date is currently unavailable to meet the January 2027 compliance date.

National Security

The lime industry is critical to the national security interests of the United States. Lime is a necessary ingredient for many other critical U.S. industries to exist and to thrive. A few examples are provided below.

Steel

Lime is essential to steel production because it acts as both a purifying and fluxing agent in the blast furnace and basic oxygen furnace processes. As a purifying agent, lime removes impurities that would otherwise weaken or contaminate the final product. In short, lime is a critical mineral that underpins both the quality and environmental performance of modern steel production. Lime makes modern steelmaking possible, serving as the foundation of one of the world's most critical manufacturing processes. Without additional lime, U.S. steel production cannot increase, and the EPA lime rule has already discouraged the construction of additional lime kilns that could fuel a resurgence in American steel production.

As the administration has noted in the first and second term, "Domestic steel production is essential for national security applications." Additionally, "Demand for steel in critical industry has increased", and "the present quantities and circumstance

of steel imports are 'weakening our internal economy' and threaten to impair national security as defined by Section 232."[1]

In a speech in May 2025, President Donald Trump said, "I proclaimed a simple, but crucially important principle if you don't have steel, you don't have a country. You don't have a country. You can't make a military. What are we going to do? Say, let's go to China to get our steel for the army tanks and for the boats and ships. A strong steel industry is not just a matter of dignity or prosperity and pride. It is above all a matter of national security and it is." The strength of U.S. steel production fundamentally depends on a vital but often overlooked mineral—lime.

Steel's critical role in national security underscores the importance of the lime industry as an irreplaceable component to national security. The nation's lime industry is critical to our national security by being a necessary building block in the manufacturing of domestic steel. A healthy domestic lime industry can support increased domestic steel production to fight back against steel imports which "impair the national security of the United States."[2]

As demand for steel in critical industries continues to grow, the domestic lime industry becomes an even more essential pillar of America's industrial and defense readiness. A robust domestic lime supply ensures uninterrupted steelmaking capacity, supports infrastructure resilience, and reduces reliance on foreign materials that could compromise national security.

Electric Power Plants

Power plants that burn coal use lime as a crucial ingredient to treat their air emissions to ensure that they meet the Clean Air Act's requirements for reducing SOx and NOx emissions. Disruptions or constraints on lime production could have negative impacts on the nation's power supply, particularly when electricity demand is surging from the growth of the U.S economy and data center development for powering artificial intelligence. Maintaining a reliable electric grid is clearly in the national security interest of the U.S.

Mining

Lime is essential for both coal and hard-rock mining companies to treat their water discharges before they are returned into streams or other waterbodies to increase the pH and ensure that the water quality is appropriate and acceptable under the Clean Water Act. Lime prevents acid mine drainage and is essential for the health of streams

[1] https://www.federalregister.gov/documents/2020/07/06/2020-14359/publication-of-a-report-on-the-effect-of-imports-of-steel-on-the-national-security-an-investigation

[2] https://www.federalregister.gov/documents/2025/02/18/2025-02833/adjusting-imports-of-steel-into-the-united-states

and the cleanup of both active and legacy mining sites. Mining provides the building blocks for the entire U.S. economy, and preventing interruptions to an essential component of this industry is in our national security interest.

Military

There are a multitude of uses of lime in the U.S. military (including the U.S. Army Corps of Engineers). The most common uses are in soil stabilization during critical base or forward command post construction, road construction, and levee repairs. In addition, lime is used to treat high explosive and metals contamination from ordinance training and storage facilities. Ensuring that the military has everything it requires in its supply chain is essential for national security.

Water Treatment

Lime is critical for water treatment and is essential in providing clean and safe drinking water for millions of Americans every day. Lime is used in pH adjustment, water softening, and removal of contaminants. Lime is also essential for wastewater treatment. As we learned during COVID, the U.S. cannot afford to have interruptions in the critical supplies of lime that millions of U.S. citizens count on for clean and safe drinking water supplies. Nothing is more important to national security than ensuring that our nation has safe and secure drinking water.

Without a steady and reliable source of lime production, the supply chain for many industries, governments, and military applications could be compromised. As mentioned in our March 28 Presidential exemption request, lime products are typically not stored or stockpiled for a long period of time, with most of the industry practicing on-demand production and delivery. If lime production were to be disrupted, stocks of lime for all uses mentioned above would be rapidly depleted, in some cases in a matter of days. Accordingly, it is clearly in the national security interest of the United States for the President to grant a two-year exemption for the lime industry.

Costs for the Lime Industry

Lime companies will need to spend between $80-$110 million over the next 12 months to comply with the EPA lime rule if a Presidential exemption is not granted for the lime industry. Such costs include engineering plans for retrofitting plants to address HCl emissions, construction of new equipment, testing of the equipment itself, as well as stack testing to ensure compliance with limits on HAP emissions. These estimates are based on feedback from several NLA member companies. These costs do not include ongoing operating costs, nor do they include staff time to address, monitor, and maintain the equipment.

One of the most significant aspects of these costs is that they may be completely unnecessary if and when EPA reconsiders the lime rule as planned. Certain aspects of the rule may be eliminated altogether, removing the need for operational and equipment changes at lime plants. EPA may determine that the emissions for various HAPs are *de minimis* and do not require emissions standards. In addition, EPA may decide to issue a "health-based standard" for HCl, which may eliminate the need for dry sorbent injection treatment systems since the agency's risk assessment proves that HCl does not endanger human health and the environment at current emission levels and would not require treatment under a health-based standard.

NLA greatly appreciates the President's consideration of granting the lime industry a two-year extension of our compliance date through a Presidential exemption. Such an action is clearly justified under Clean Air Act § 112(i)(4) because it would be reasonable for the President to determine that the technology to implement such standards is not available during the required timeframe, and that it is in the national security interests of the United States to do so. In addition, it should be noted that under Clean Air Act § 307(b), actions by the President, such as this Presidential exemption, are not subject to judicial review. *See* 42 U.S.C. §7607(b) (providing judicial review for actions by the EPA Administrator, but not for Presidential actions).

NLA and our members look forward to working with EPA and the White House to enact common-sense regulations that protect human health and the environment, while ensuring that the production of lime that is critical to supplying the steel, electricity, coal and minerals, and water that this nation needs is provided uninterrupted.

Sincerely,

William Herz
Executive Director
National Lime Association

ORAL ARGUMENT NOT YET SCHEDULED

IN THE UNITED STATES COURT OF APPEALS FOR THE DISTRICT OF COLUMBIA CIRCUIT

AIR ALLIANCE HOUSTON, et al., *Petitioners*, v. UNITED STATES ENVIRONMENTAL PROTECTION AGENCY and LEE ZELDIN, Administrator, U.S. Environmental Protection Agency, *Respondents*.	Case No. 25-1143

PETITIONERS' RESPONSE IN OPPOSITION TO RESPONDENTS' MOTION FOR SIX-MONTH ABEYANCE

In April, President Trump gave nearly one-third of coal-fired power plants across the country a free pass to cease their preparations to meet lower mercury and air toxic emissions standards. EPA updated those standards, known as MATS, just over a year ago. In doing so, EPA recognized that the vast majority of coal-fired power plants were capable of and indeed already limiting their emissions of these dangerous pollutants below what was required in its prior, 2012 standards. Nevertheless, with a stroke of his pen, the President in his April 8, 2025 Proclamation exempted an unspecified list of facilities from their compliance

obligations through July 2029 by summarily asserting, without evidence or even a gesture at source-specific analysis, that "technology to implement" that Rule is "not available." Proclamation 10914 of April 8, 2025, 90 Fed. Reg. 16,777 (Apr. 21, 2025). That Proclamation was followed by EPA's publication of a list of the particular facilities to which the Proclamation would apply, which likewise offered no evidence or logic for those facilities' selection.

The President's assertion that the technology is unavailable is false.[1] And EPA's action to apply that declaration to particular facilities is unlawful. That unlawful action is having effects today. As prospective Respondent-Intervenor Talen Montana, LLC, confirms in its motion to intervene, coal plants have already suspended actions to reduce their emissions to comply with the updated standards. *See* Mot. to Intervene, ECF 2129297 at 6 (asserting that Talen Montana, operator of one of the exempted facilities, "has already made operational planning and compliance decisions in reliance on the Presidential Exemption"). Petitioners are entitled to pursue judicial review and seek judicial relief to minimize and prevent harm to Petitioners, their members, and the public from the unlawful exemptions effectuated by EPA.

[1] EPA admitted as much in its recent proposal to repeal the 2024 MATS Rule, writing that the Colstrip Power Plant in Colstrip, Montana, "was *the only* facility unable to meet the lower [filterable particulate matter] standard with *existing controls*." 90 Fed. Reg. 25,535, 25,541 (June 17, 2025) (emphasis added).

The six-month abeyance Respondents request, ECF 2128844 ("Abeyance Mot."), seeks to deprive Petitioners of that opportunity. While Petitioners have indicated to Respondents that they may be willing to consider abeyance of this petition in the event district court litigation concerning the Exemption Proclamation itself proceeds apace, *see Air Alliance Houston v. Trump*, Case No. 1:25-cv-1852-PLF (filed June 12, 2025), Respondents have not yet filed their responsive pleading in that matter, so it remains unknown which forum will take the lead on these questions. Plus, Respondents are seeking abeyance in that matter as well or, in the alternative, further delay of their answer deadline. *Id.*, ECF No. 26. A six-month abeyance of this petition before any indication that Petitioners will be able to vindicate their rights in the district court litigation would be patently premature.

Forcing this case into abeyance now, without a confirmed alternative forum, would thus impose substantial hardship on Petitioners and their members by depriving them of the emissions reductions that would flow from timely judicial review and timely industry compliance with the standards. Petitioners' and the public's interests in promptly achieving the health protections afforded by the updated MATS rule far outweigh the modest burden on Respondents to defend their actions. The *potential* future repeal of parts of that rule—which EPA proposes to accomplish through a separate action under separate statutory

authority does not moot and should not delay review of the unlawful action EPA has already taken. The Court should deny Respondents' abeyance request.

BACKGROUND

Coal plants are one of the largest domestic emitters of hazardous air pollutants like mercury, arsenic, nickel, and other toxic metals. *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, 89 Fed. Reg. 38,508, 38,509 (May 7, 2024) ("2024 Rule"). Short-term exposure to these pollutants can result in profound central nervous system effects; chronic exposure can cause brain and kidney damage, cancer, developmental effects, and a range of other adverse health effects. *Id.* at 38,556.

To address those risks, EPA first promulgated hazardous air pollutant standards for coal- and oil-fired power plants in 2012 under Section 112 of the Clean Air Act, 42 U.S.C. § 7412. After hazardous air pollutant emission standards are established, the Act requires EPA to review developments in control technologies to determine if revisions are necessary. *Id.* § 7412(d)(6).

As a result of its Section 7412(d)(6) review, EPA revised the MATS in 2024. The 2024 Rule set more protective limits on arsenic, nickel, and other metals pollution, represented by a surrogate "filterable particulate matter" standard (setting a new "fPM standard"), and further restricted mercury emissions from a

subset of plants using high-polluting lignite coal (the new "mercury standard"). 89 Fed. Reg. at 38,510. The 2024 Rule also required facilities to use continuous emissions monitoring rather than infrequent "stack testing" to demonstrate compliance with the new fPM standard (the "CEMS" requirement). *Id.* And it tightened standards for controlling pollution during plant startup periods. *Id.* EPA projected that the 2024 Rule would reduce annual emissions of mercury by 900 to 1,000 pounds and annual emissions of arsenic, nickel, and other toxic metals by about four to seven tons per year, starting in 2028. *Id.* at 38,561.

The 2024 Rule required coal plants to comply with the startup standard by January 2, 2025, and with the fPM standard, the mercury standard, and other requirements by July 6, 2027. *Id.* at 38,519, 38,564. The 2027 compliance deadline reflected EPA's assessment of the lead time necessary for the regulated coal plants to procure and install necessary emissions controls, upgrade controls, or optimize or dial up controls already installed, and to take other compliance steps that would allow them to meet the requisite standards. *Id.* at 38,519 ("The Agency believes this timeline is as expeditious as practicable considering the potential need for some sources to upgrade or replace pollution controls.").

Earlier this year, on what EPA touted as the "greatest day of deregulation our nation has seen," EPA announced it intended to "reconsider" the 2024 Rule.[2] At the same time, EPA invited coal plants to apply for a two-year Presidential exemption from compliance obligations. EPA subsequently took receipt of numerous such requests.

On April 8, 2025, President Trump issued a Proclamation titled *Regulatory Relief for Certain Stationary Sources to Promote American Energy*, later published in the Federal Register at 90 Fed. Reg. 16,777 (Apr. 21, 2025) ("Exemption Proclamation").[3] The Exemption Proclamation granted an unspecified list of coal plants exemptions from compliance with the 2024 Rule "for the period beginning July 8, 2027, and concluding July 8, 2029." Proclamation Announcement (referring to, but not publishing, an "Annex I" of exempt sources); *see* 90 Fed. Reg. 16,777. The list of exempt coal plants, known as Annex I, was not finalized

---

[2] EPA, News Release, *Trump EPA to Reconsider Biden-Harris MATS Regulation That Targeted Coal-Fired Power Plants to be Shut Down* (Mar. 12, 2025), https://www.epa.gov/newsreleases/trumpepa-reconsider-biden-harris-mats-regulation-targeted-coal-fired-power-plants-be; EPA, News Release, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://www.epa.gov/newsreleases/epa-launches-biggest-deregulatory-action-us-history.

[3] The Exemption Proclamation was published initially on the White House's website: https://www.whitehouse.gov/presidential-actions/2025/04/rregulatory-relief-for-certain-stationary-sources-to-promote-american-energy/ ("Proclamation Announcement").

until six days later, on April 14, 2025, when EPA published the list of facilities to be exempted on its website.[4] EPA's Annex I list was then appended to the Exemption Proclamation for publication in the Federal Register a week later. 90 Fed. Reg. at 16,779-84.

Two months later, on June 11, 2025, EPA signed a notice of proposed rulemaking that proposed to repeal the new fPM standard, the new mercury standard, and the CEMS requirements of the 2024 Rule, and solicited public comment. 90 Fed. Reg. at 25,535. EPA did not propose to repeal the 2024 Rule's startup standard, which is presently in effect. *Id.* at 25,535, 25,539 n.6 (explaining that "EPA is not reconsidering this aspect of the 2024 Final Action").[5]

Petitioners filed this lawsuit on June 12, 2025, challenging EPA's promulgation of the Annex I list of exempt sources.

STANDARD OF REVIEW

Courts have discretion to stay a case to promote efficient use of the court's and litigants' resources, after weighing the benefits and hardships of a stay. *See Landis v. N. Am. Co.*, 299 U.S. 248, 254-55, 259 (1936). But if there is even "a fair possibility" that the stay "will work damage to some one else," the movant must

[4] *Available at* https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf.

[5] The President also issued a second Proclamation on July 17, 2025, directly exempting an additional three coal plants. 90 Fed. Reg. 34,583 (July 23, 2025).

"make out a clear case of hardship or inequity in being required to go forward." *Landis*, 299 U.S. at 255-56 (explaining that "the burden of making out the justice and wisdom" of a stay "lay heavily" on the movant). Thus, the movant must either show that (1) the movant's harms meet the heightened "clear case of hardship or inequity" standard, or (2) the opposing party's claims of hardship are non-existent.

A court is not compelled to stay a live controversy simply because it may become moot in the future. *See Hunt v. Imperial Merchant Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009). "A case is moot 'when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome.'" *Samma v. Dep't of Def.*, 136 F.4th 1108, 1113 (D.C. Cir. 2025) (quoting *Already, LLC v. Nike, Inc.*, 568 U.S. 85, 91 (2013)). Mootness arises only if there is nothing for the court to remedy. *Spencer v. Kemna*, 523 U.S. 1, 18 (1998).

ARGUMENT

I. An Abeyance Would Harm Petitioners Whereas Respondents Fail To Show a Clear Case of Hardship.

Petitioners and their members are being exposed to pollution from exempted coal plants now. By challenging EPA's selection of facilities subject to the President's Exemption Proclamation, this suit seeks to ensure those plants are taking steps *now* to comply with the standards that will alleviate those exposures.

The requested six-month abeyance would prejudice Petitioners' ability to get prompt, meaningful judicial review of the list of facilities selected for exemption,

and thus to restore compliance obligations at plants that were unlawfully exempted. By contrast, Respondents identify no hardship from allowing the case to proceed—at least until Petitioners can be assured they have a suitable forum for their claims—other than the litigation costs necessary to defend their own unlawful actions. The balance of these interests strongly favors Petitioners, and Respondents therefore fail to meet their burden to stay this case at this time. *Landis*, 299 U.S. at 255-56.

Petitioners are environmental and public health organizations with members who live, work, and recreate in areas affected by the mercury, arsenic, and other metals pollution emitted by exempted coal plants. Petitioners' members are concerned that exposure to pollution from exempted plants, including from eating contaminated fish, could have harmful impacts on their health. These concerns also reduce members' enjoyment of outdoor activities in affected areas.

The 2024 Rule will achieve significant reductions in emissions of mercury, arsenic, and other metals each year from coal plants. 89 Fed. Reg. at 38,561. Those emissions reductions—and the steps necessary to secure them—have been occurring since the 2024 Rule took effect and continue apace, as plants take steps to prepare for full compliance by the 2027 deadline. Indeed, states that challenged the 2024 Rule asserted in court filings that "to comply with the Rule's three-year deadline . . . power plants need to take action immediately." *North Dakota v. EPA*,

Case No. 24-1119, ECF 2058570 at 1. Industry parties have also asserted that these years before the 2024 Rule compliance deadlines are necessary for sources to prepare for compliance. *See, e.g.*, Nat'l Mining Ass'n, Comments on the proposed MATS Rule, 88 Fed. Reg. 24,854, at 12 (June 23, 2023), *available at* https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0794-5986. Plants already must comply with the more stringent startup standard, which had a January 2025 compliance deadline. 89 Fed. Reg. at 38,519, 38,564.

At the latest, the emission reductions required by the 2024 Rule must be achieved by the 2027 deadline. But not so for exempted coal plants. Under the terms of the Exemption Proclamations, no emission reductions will be required between 2027 and 2029. Despite the Clean Air Act's limitation of such exemptions to a two-year period, coal plants have *already* stopped working to reduce their emissions or better control their pollution during the present compliance period (as, indeed, the Administration intended): prospective Respondent-Intervenor Talen, an operator and co-owner of an exempted coal plant, stated that the 2024 Rule's compliance deadline "would require substantial and immediate expenditures" but that it has "suspended" compliance activities necessary to meet that deadline "[i]n reliance on the Presidential Exemption." Mot. to Intervene at 3. And others have almost certainly followed suit.

A facility's inclusion on the Annex I list thus delays the benefits of the reductions in emissions from exempted plants' compliance with the 2024 Rule, and prolongs members' exposure to pollution at present, higher levels. It also delays the benefits of continuous emissions monitoring systems, denying Petitioners and Petitioners' members information about coal plant emissions.

Those consequences flow from Annex I's selection of exempted facilities, not from EPA's proposed reconsideration of the 2024 Rule—which did not and could not exempt facilities from compliance with the Rule while it remains good law. The present operation of those exemptions is thus denying Petitioners' members and the public the benefits that would accrue in the absence of those exemptions: both the present-day emission reductions from the startup standard and the present and future emission reductions from sources upgrading or installing emissions controls to comply with the 2024 Rule that is presently in force. Indeed, because EPA, state regulators, and exempted coal plants have asserted that certain coal plants must begin preparations *immediately* to be able to meet standards by 2027, delay in resolving this case could mean compliance by 2027 is not possible, even if the Court ultimately finds it is legally required.[6] *See* Mot. to Intervene at 3

[6] Because exemptions may be extended after the two-year period expires, Petitioners' members and the public face the prospect of damage to their health and recreational interests for years to come. 42 U.S.C. § 7412(i)(4) ("An exemption . . . may be extended for 1 or more additional periods, each period not to exceed 2 years.").

(stating that meeting the 2024 Rule's deadline "would require substantial and immediate expenditures"); *see also* 89 Fed. Reg. at 38,519; *North Dakota v. EPA*, ECF 2058570 at 1, 18. Delaying judicial review would thus delay the cleaner air and better health that flows from lower emissions—and to which Petitioners and their members are legally entitled.

For these reasons, Petitioners must be assured of timely judicial review. Under Respondents' proposed six-month delay—which they have requested both in this case and in the parallel district court case—Petitioners face the "fair possibility" of securing relief too late for exempted plants to achieve compliance by 2027. *Landis*, 299 U.S. at 255. That outcome would "work damage" to Petitioners' members, who will be exposed to more mercury and toxic metal pollution from exempted coal plants pollution that Petitioners seek to reduce by having the exemptions declared unlawful. *Id.* For the same reason Respondents issued the exemptions well in advance of the 2024 Rule's deadlines, Petitioners have a strong interest in resolving the question of their lawfulness well in advance of the deadlines: the exemptions affect present decisions about the timing of emission reductions.

As Petitioners have discussed with Respondents, abeyance of this petition *may* be appropriate in the future, if it becomes clear that district court challenges to the associated Exemption Proclamation are proceeding in a timely enough fashion

to secure the necessary relief. But Respondents have failed to carry their burden of showing a "clear case of hardship or inequity" in being required to go forward without an abeyance, at least until that time. *Id.* at 255-56 ("the burden of making" the case for a stay "lay heavily" on the movants). They assert only that abeyance would "promote judicial economy." Abeyance Mot. at 4. Such an interest falls short of meeting the heightened standard of a "clear case of hardship or inequity," *Landis*, 299 U.S. at 255-56; *see Lockyer v. Mirant Corp.*, 398 F.3d 1098, 1112 (9th Cir. 2005), and is outweighed by Petitioners' interests in protecting the health of their members and the public from unlawful pollution.

That is especially true where the action concerns exemptions that the law does not compel (or, indeed, allow, *see* Complaint, *Air Alliance Houston v. Trump*, Case No. 1:25-cv-1852-PLF (filed June 12, 2025) (asserting that the Exemption Proclamation is *ultra vires*)). It would be inequitable for Respondents to evade timely judicial review of the exemptions they chose to issue, merely because they chose also to reconsider aspects of the 2024 Rule. The Clean Air Act, furthermore, expressly limits EPA's ability to stay the effectiveness of a rule during reconsideration "for a period not to exceed three months." 42 U.S.C. § 7607(d)(7)(B). Respondents should not be permitted to use the court to achieve a back-door stay pending reconsideration for exempted facilities.

Moreover, Respondents cannot reasonably claim that their chosen timing obviates any harm from the exemptions; Respondents chose to exempt a large group of facilities and pursue repeal of the 2024 Rule at the same time, and presumably would not have done so unless they believed the exemptions had their own, present impact. *Landis*, 299 U.S. at 255-56.

II. Respondents' claim that agency action may, in the future, moot this case does not justify abeyance.

Petitioners' challenge to the legality of Annex I presents a live controversy that can be meaningfully remedied and is therefore not moot. *See Samma*, 136 F.4th at 1113 ("A case is moot when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome." (internal quotation omitted)). As explained above, Annex I is final and in effect—as is the 2024 Rule—and guides the activities regulated coal plants are taking (or not taking) right now. As described in Section I above, harm to Petitioners and their members from postponing emissions reductions is ongoing and will only increase as the 2027 deadline grows closer and compliance steps remain unfinished.

That a potential final action by EPA to rescind the 2024 rule "could" moot this case, as Respondents argue, is not sufficient grounds to put the case in abeyance. Where harm is ongoing, timely review is of the essence, and judicial relief would be effective, the Court is not obligated to step aside even where a case might become moot shortly. *See Crawford v. FCC*, 417 F.3d 1289, 1294-95 (D.C.

Cir. 2005) (deciding case where FCC action would effectively moot the claim, but that action had not yet become final); *Lewis v. BT Inv. Managers, Inc.*, 447 U.S. 27, 53 n.15 (1980) (concluding that because challenged state statutes "remain in effect," "the case has not become moot, whatever the ultimate disposition" of pending bills to amend them).[7]

As an initial matter, even if EPA adopts its proposal, it could not entirely moot this case: the 2024 Rule consists of several distinct standards and requirements, and EPA does not propose to repeal or modify *all* of them. For instance, EPA stated that it is "not reconsidering" the more stringent startup standard. 90 Fed. Reg. at 25,535, 25,539 n.6. The Exemption Proclamation, on the other hand, exempts Annex I power plants "from compliance with the Rule," which seemingly includes the 2024 Rule's startup standard. 90 Fed. Reg. 16,777 (Apr. 21, 2025). Thus, the validity of the exemptions effectuated by Annex I would remain a live controversy even if the rule is finalized as proposed.

---

[7] Other circuits have concluded the same. *See, e.g.*, *Hunt v. Imperial Merch. Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009) (declining to "dismiss a live controversy as moot merely because it may become moot in the near future"); *Muniz v. Sabol,* 517 F.3d 29, 34 (1st Cir. 2008) (controversy "clearly not moot" even where the requested relief would have occurred within a few weeks regardless of the case's outcome); *League of United Latin Am. Citizens v. Bredesen*, 500 F.3d 523, 530 n.5 (6th Cir. 2007) (deciding case where superseding legislation would inevitably moot controversy, but law did not take effect for another month).

In any event, any mootness assessment is premature under the circumstances: We know neither *what* action EPA will take on its proposal, nor *when* it will take it. EPA has only *proposed* to repeal aspects of the 2024 Rule; it must now consider and respond to public comments on that proposal. *See* 42 U.S.C. § 7607(d)(5), (6)(B). The Clean Air Act and Administrative Procedure Act require that EPA's rulemakings be based on consideration of law, data, factual findings, and reasoned decision-making, and reflect input from the public. 42 U.S.C. § 7607(d); 5 U.S.C. § 553. These requirements "ensure that agency regulations are tested via exposure to diverse public comment," and provide "notice and the opportunity to be heard" as an essential component of "fairness to affected parties." *Int'l Union, UMW v. Mine Safety & Health Admin.*, 407 F.3d 1250, 1259 (D.C. Cir. 2005) (cleaned up) (citing *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 547 (D.C. Cir. 1983)).

So, although EPA *could* finalize the action as proposed at the conclusion of the notice and comment process, it runs counter to the core principles of agency responsiveness to the public and regulated community to presume the Agency will. EPA also might issue an action with "major changes" from the proposal—which may not ultimately moot the present controversy. *See* 42 U.S.C. § 7607(d)(6)(A). Indeed, because Annex I serves to exempt the listed coal plants "from compliance with the Rule," 90 Fed. Reg. at 16,777, leaving even a single requirement of the

2024 Rule in place keeps the issues presented in this case "live" and capable of being remedied. *Larsen v. U.S. Navy*, 525 F.3d 1, 3-4 (D.C. Cir. 2008). EPA could also decide to modify its approach and issue a new proposal,[8] or to rescind the proposal altogether. The Court should not stay this case on the mere possibility the 2024 Rule will be repealed as proposed.

We also do not know *when* EPA will take final action on its proposal. Respondents characterize EPA's intention to promulgate a final rule by December 2025 as a "goal," and it is just that. *See* Abeyance Mot. at 4. EPA is not subject to any legal requirement to act by December 2025 or any other date. A nonbinding statement located on a website expressing EPA's intent to act before the end of the year is not sufficiently concrete to warrant abeyance. *See Am. Petrol. Inst. v. EPA*, 683 F.3d 382, 389 (D.C. Cir. 2012) (emphasizing that a settlement required EPA to issue a final rule by a "definite end date"). Indeed, the D.C. Circuit has cautioned that agencies cannot "stave off judicial review of a challenged rule simply by

[8] In fact, EPA requested comment on alternative standards that the Agency should consider in lieu of repealing the 2024 Rule fPM and mercury standards. 90 Fed. Reg. at 25,544-45 (June 17, 2025). Petitioners are among thousands of commenters on EPA's proposed repeal, and commented, among other things, that there *are* cost-effective intermediate standards. *See, e.g.*, Air Alliance Houston et al., Comments of Public Health and Environmental Organizations on Proposed Rule on National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Unit (June 17, 2025), EPA-HQ-OAR-2018-0794-7609, available at: https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0794-7609.

initiating a new proposed rulemaking that would amend the rule in a significant way." *Id.* at 388.

In any event, if history is any guide, final action is far from imminent. December 2025 is an ambitious goal. In practice, it can take EPA a year or longer to finalize action after the notice of proposed rulemaking.[9] Indeed, the Agency's last three MATS rulemakings each took more than a year between proposed and final action. *See, e.g.*, 89 Fed. Reg. at 38,509 (notice of proposed rulemaking published on April 24, 2023; final rule published on May 7, 2024); 88 Fed. Reg. 13,956 (Mar. 6, 2023) (proposed rule published February 9, 2022); 85 Fed. Reg. 31,286, 31,286-87 (May 22, 2020) (proposed rule published February 7, 2019). Especially in an area of great complexity and public interest, there is reason to doubt that EPA will be able to respond to those comments and finalize a rule in half its typical time.

[9] EPA has asserted as much in signed declarations concerning other rules issued under Section 7412. *See, e.g.*, Decl. of Penny E. Lassiter ¶ 4 & tbl., rows 8-10, *Blue Ridge Envtl. Def. League v. Regan*, No. 1:22-cv-03134, ECF No. 36 (D.D.C. Nov. 4, 2024) (stating that the "earliest possible completion date" for a Clean Air Act Section 7412 rulemaking on hazardous waste combustors was 10 months from proposal to final rule); Decl. of Panagiotis E. Tsirigotis ¶ 16 tbl. 3, row 4, ¶¶ 22-24, *Sierra Club v. Pruitt*, No. 1:16-cv-02461-TJK, ECF No. 13-3 (D.D.C. Oct. 19, 2017) (identifying the "minimum number of days" for a Clean Air Act Section 7412 technology review rulemaking on solid waste incinerators as one year from proposal to final rule).

In contrast, should near-term proceedings in the district court demonstrate that litigation in this Court is necessary to protect Petitioners' interests, the present, unlawful and irreparable emission of dangerous pollutants from the Annex I facilities would warrant expedited consideration of this petition. *See* D.C. Cir. Handbook VIII.B. Considering the likelihood of delay in meeting the December 2025 "goal," this Court could be positioned to grant relief before EPA takes final action. Even if Petitioners were to finalize a repeal rule before the Court concluded expedited consideration of this petition, such a repeal might not go into effect before the Court ruled here because any repeal rule may be stayed pending its own course of judicial review. In those circumstances, definitive rejection of EPA's selection of Annex I facilities would still secure important relief for Petitioners.

Finally, proceeding with this litigation while EPA's rulemaking proceeds does not present the concerns identified in *American Petroleum Institute v. EPA*, 683 F.3d 382 (D.C. Cir. 2012), and the other authorities Respondents cite in support of abeyance. Those cases arose in the context of an agency's reconsideration of the very rules being challenged in the litigation they sought to abate. *See, e.g.*, *id.* at 386-88. Here, by contrast, EPA seeks abeyance of litigation challenging Annex I on the basis that it is reconsidering an independent agency action, the 2024 Rule. But neither Annex I nor the exemptions themselves are being reconsidered and neither will be terminated by whatever action EPA decides

to take on the 2024 Rule. As such, the Court is not being asked to review an action that is itself "tentative" or subject to change or "eliminat[ion]." *Id.* at 387-88. And this is not a matter where, as in *Center for Biological Diversity v. EPA*, 56 F.4th 55, 60-61 (D.C. Cir. 2022), *see* Abeyance Mot. at 4, the parties reached a private settlement and jointly requested abeyance to allow time for the settlement's implementation.

CONCLUSION

For the reasons stated above, abeyance in this case is, at a minimum, premature, and could bring about substantial harm. The Court should deny Respondents' motion for a six-month abeyance.

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

AIR ALLIANCE HOUSTON, et al.,

Plaintiffs,

v.

DONALD TRUMP, et al.,

Defendants.

Case No. 1:25-cv-1852-PLF

PLAINTIFFS' MEMORANDUM IN OPPOSITION TO DEFENDANTS' MOTION FOR SIX-MONTH ABEYANCE

In April, President Trump gave nearly one-third of coal-fired power plants across the country a free pass to cease their preparations to meet lower mercury and air toxic emissions standards. EPA updated those standards, known as MATS, just over a year ago. In doing so, EPA recognized that the vast majority of coal-fired power plants were capable of and indeed already limiting their emissions of these dangerous pollutants below what was required in its prior, 2012 standards. Nevertheless, with a stroke of his pen, the President in his April 8, 2025 Proclamation (supplemented in a July 17, 2025 Proclamation) exempted 71 facilities from their compliance obligations through July 2029 by summarily asserting, without evidence or even a gesture at source-specific analysis, that "technology to implement" that Rule is "not available." Proclamation 10914 of April 8, 2025, 90 Fed. Reg. 16,777 (Apr. 21, 2025).

The President's assertion is false,[1] and the President's action is unlawful. That unlawful action is having effects today. As prospective Intervenor-Defendant Talen Montana, LLC,

[1] EPA admitted as much in its recent proposal to repeal the 2024 MATS Rule, writing that the Colstrip Power Plant in Colstrip, Montana, "was *the only* facility unable to meet the lower

ED_021114_00003486-00001

confirms in its motion to intervene, coal plants have already suspended actions to reduce their emissions to comply with updated standards. *See* Talen Memo. in Supp. of Motion to Intervene, Dkt. 29-1 at 4 (asserting that Talen Montana, operator of one of the exempted facilities, "has already made operational planning and compliance decisions in reliance on the Presidential Exemption"). Plaintiffs are entitled to prompt review and judicial relief to minimize and prevent harm to Plaintiffs, their members, and the public from the unlawful exemption proclamations.

The six-month abeyance Defendants request would deprive Plaintiffs of that timely review. A stay would impose substantial hardship on Plaintiffs and their members by depriving them of the emissions reductions that would flow from timely compliance with the standards. Plaintiffs' and the public's interests in promptly achieving the health protections afforded by the updated MATS rule far outweigh the modest burden on Defendants to defend the exemptions. The *potential* future repeal of parts of that rule—which EPA proposes to accomplish through a separate action under separate statutory authority — does not moot and should not delay review of the President's unlawful action. The Court should deny Defendants' abeyance request.

The Court should also deny Defendants' alternative request for a 21-day extension of their responsive pleading deadline. This case has been pending since June 12. Defendants' deadline has already been extended twice, most recently to September 19, 2025. Defendants have not shown good cause for further delay.

BACKGROUND

Coal plants are one of the largest domestic emitters of hazardous air pollutants like mercury, arsenic, nickel, and other toxic metals. *National Emission Standards for Hazardous Air*

[filterable particulate matter] standard with *existing controls*." 90 Fed. Reg. 25,535, 25,541 (June 17, 2025) (emphasis added).

ED_021114_00003486-00002

Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 89 Fed. Reg. 38,508, 38,509 (May 7, 2024) ("2024 Rule"). Short-term exposure to these pollutants can result in profound central nervous system effects; chronic exposure can cause brain and kidney damage, cancer, developmental effects, and a range of other adverse health effects. *Id.* at 38,556.

To address those risks, EPA first promulgated hazardous air pollutant standards for coal- and oil-fired power plants in 2012 under Section 112 of the Clean Air Act, 42 U.S.C. § 7412. After hazardous air pollutant emission standards are established, the Act requires EPA to review developments in control technologies to determine if revisions are necessary. *Id.* § 7412(d)(6).

As a result of its Section 7412(d)(6) review, EPA revised the MATS in 2024. The 2024 Rule set more protective limits on arsenic, nickel, and other metals pollution, represented by a surrogate "filterable particulate matter" standard (setting a new "fPM standard"), and further restricted mercury emissions from a subset of plants using high-polluting lignite coal (the new "mercury standard"). 89 Fed. Reg. at 38,510. The 2024 Rule also required facilities to use continuous emissions monitoring rather than infrequent "stack testing" to demonstrate compliance with the new standards (the "CEMS" requirement). *Id.* And it tightened standards for controlling pollution during plant startup periods. *Id.* EPA projected that the 2024 Rule would reduce annual emissions of mercury by 900 to 1,000 pounds and annual emissions of arsenic, nickel, and other toxic metals by about four to seven tons per year, starting in 2028. *Id.* at 38,561; Ex. 3 to Suppl. Compl. at 8, ECF No. 31-5 (describing emissions reductions in 2028).

The 2024 Rule required coal plants to comply with the startup standard by January 2, 2025, and with the fPM standard, the mercury standard, and other requirements by July 6, 2027. *Id.* at 38,519, 38,564. The 2027 compliance deadline reflected EPA's assessment of the lead time

ED_021114_00003486-00003

necessary for the regulated coal plants to procure and install necessary emissions controls, upgrade controls, or optimize or dial up controls already installed, and to take other compliance steps that would allow them to meet the requisite standards. *Id.* at 38,519 ("The Agency believes this timeline is as expeditious as practicable considering the potential need for some sources to upgrade or replace pollution controls.").

Earlier this year, on what EPA touted as the "greatest day of deregulation our nation has seen," EPA announced it intended to "reconsider" the 2024 Rule.[2] At the same time, EPA invited coal plants to apply for a two-year Presidential exemption from compliance obligations. EPA subsequently took receipt of numerous such requests. Ex. 7 to Suppl Compl. ECF No. 31-9.

On April 8, 2025, President Trump issued a Proclamation titled *Regulatory Relief for Certain Stationary Sources to Promote American Energy*, later published in the Federal Register at 90 Fed. Reg. 16,777 (Apr. 21, 2025) ("Exemption Proclamation").[3] The Exemption Proclamation granted an unspecified list of coal plants exemptions from compliance with the 2024 Rule "for the period beginning July 8, 2027, and concluding July 8, 2029." Proclamation Announcement (referring to, but not publishing, "Annex I" of exempt sources); *see* 90 Fed. Reg. 16,777. The list of exempt coal plants, known as Annex I, was later published by EPA on its

[3] The Exemption Proclamation was published initially on the White House's website: https://www.whitehouse.gov/presidential-actions/2025/04/regulatory-relief-for-certain-stationary-sources-to-promote-american-energy/ ("Proclamation Announcement").

website on April 14, 2025,[4] before being appended to the Exemption Proclamation for publication in the Federal Register. 90 Fed. Reg. at 16,779-84.

Two months later, EPA signed a notice of proposed rulemaking that proposed to repeal the new fPM standard, the new mercury standard, and the CEMS requirements of the 2024 Rule, and solicited public comment. 90 Fed. Reg. 25,535 (June 17, 2025). EPA did not propose to repeal the revised startup standard, which is presently in effect. *Id.* at 25,535, 25,539 n.6 (explaining that "EPA is not reconsidering this aspect of the 2024 Final Action").

The President issued a second Proclamation on July 17, 2025, exempting an additional three coal plants. 90 Fed. Reg. 34,583 (July 23, 2025).[5]

Plaintiffs filed this lawsuit on June 12, 2025, challenging the Exemption Proclamation as contrary to 42 U.S.C. § 7412(i)(4) of the Clean Air Act and in excess of legal authority.

STANDARD OF REVIEW

Courts have discretion to stay a case to promote efficient use of the court's and litigants' resources, after weighing the benefits and hardships of a stay. *See Landis v. N. Am. Co.*, 299 U.S. 248, 254-55, 259 (1936); *Allen v. District of Columbia*, No. 20-CV-02453-TSC, 2024 WL 379811 (D.D.C. Feb. 1, 2024). But if there is even "a fair possibility" that the stay "will work damage to some one else," the movant must "make out a clear case of hardship or inequity in being required to go forward." *Landis*, 299 U.S. at 255-56 (explaining that "the burden of

[4] *Available at* https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf.

[5] Unlike the April 8, 2025 Exemption Proclamation, the initial publication of the second Proclamation on the White House's website included the list of facilities to which it applied: https://www.whitehouse.gov/presidential-actions/2025/07/regulatory-relief-for-certain-stationary-sources-to-further-promote-american-energy/.

ED_021114_00003486-00005

making out the justice and wisdom" of a stay "lay heavily" on the movant). Thus, the movant must either show that (1) the movant's harms meet the heightened "clear case of hardship or inequity" standard, or (2) the opposing party's claims of hardship are non-existent.

A court need not "dismiss or stay a live controversy simply because it may become moot in the future." *All. for Wild Rockies v. Gassman*, No. CV-21-105-M-DLC-KLD, 2022 WL 3030997, at *3 (D. Mont. Aug. 1, 2022) (denying Forest Service's request to stay litigation while it reconsidered decision implementing project following court's entry of preliminary injunction) (citing *Hunt v. Imperial Merchant Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009)). "A case is moot 'when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome.'" *Samma v. Dep't of Def.*, 136 F.4th 1108, 1113 (D.C. Cir. 2025) (quoting *Already, LLC v. Nike, Inc.*, 568 U.S. 85, 91 (2013)). Mootness arises only if there is nothing for the court to remedy. *Spencer v. Kemna*, 523 U.S. 1, 18 (1998).

ARGUMENT

I. An abeyance would harm Plaintiffs whereas Defendants do not show a clear case of hardship

Plaintiffs and their members are being exposed to pollution from exempted coal plants now. They seek to enjoin the Exemption Proclamations to ensure those plants are taking steps *now* to comply with the standards that will alleviate those exposures. The requested six-month abeyance would prejudice Plaintiffs' ability to get prompt, meaningful judicial review of the Exemption Proclamations, and thus to restore the compliance obligations at plants that were unlawfully exempted. By contrast, Defendants identify no hardship from allowing the case to proceed, other than the litigation costs necessary to defend their own unlawful actions. The

ED_021114_00003486-00006

balance of these interests strongly favors Plaintiffs, and Defendants therefore fail to meet their burden to stay this case. *Landis*, 299 U.S. at 255–56.

Plaintiffs are environmental and public health organizations with members who live, work, and recreate in areas affected by the mercury, arsenic, and other metals pollution emitted by exempted coal plants. Suppl. Compl. ¶¶ 144, 146, 148-153, 155-160; *see* Decl. of Stephanie Coates ¶¶ 15-19, 23 (attached as Ex. 1); Decl. of Michelle L. Marley-Knox ¶¶ 3-4, 8-9, 12 (attached as Ex. 2); Suppl. Decl. of Michelle L. Marley-Knox ¶¶ 3-4, 6-8 (attached as Ex. 3); Decl. of Derf Johnson ¶¶ 6-9 (attached as Ex. 4); Decl. of Catherine Fleischman ¶¶ 2-3, 7 (attached as Ex. 5); Decl. of Barbara Sue ¶¶ 2-3, 6 (attached as Ex. 6). Plaintiffs' members are concerned that exposure to pollution from exempted plants, including from eating contaminated fish, could have harmful impacts on their health. Suppl. Compl. ¶¶ 144-145, 148-153, 155-160; Coates Decl. ¶¶ 15-17, 21, 23; Marley-Knox Decl. ¶¶ 9-12; Marley-Knox Suppl. Decl. ¶¶ 6, 8; Johnson Decl. ¶¶ 8-9, 11, 13-14; Fleischman Decl. ¶ 4; Sue Decl. ¶¶ 4, 9. These concerns also reduce members' enjoyment of outdoor activities in affected areas. Suppl. Compl. ¶¶ 144, 146-153, 155-160; Coates Decl. ¶¶ 17, 23; Marley-Knox Decl. ¶¶ 8-10, 12; Marley-Knox Suppl. Decl. ¶¶ 6, 8; Johnson Decl. ¶¶ 5-9, 11-14; Fleischman Decl. ¶ 6; Sue Decl. ¶¶ 3-4.

The 2024 Rule will achieve significant reductions in emissions of mercury, arsenic, and other metals each year from coal plants. 89 Fed. Reg. at 38,561. Those emissions reductions—and the steps necessary to secure them—have been occurring since the 2024 Rule took effect and continue apace, as plants take steps to prepare for full compliance by the 2027 deadline. Indeed, states that challenged the 2024 Rule asserted in court filings that "to comply with the Rule's three-year deadline . . . power plants need to take action immediately." Amended Mot. for Stay at 1, *North Dakota v. EPA*, No. 24-1119 (D.C. Cir.), Doc. #2058570 (attached as Ex. 7). Industry

ED_021114_00003486-00007

parties have also asserted that these years before the 2024 Rule compliance deadlines are necessary for sources to prepare for compliance. *See, e.g.*, Nat'l Mining Ass'n, Comments on the proposed MATS Rule, 88 Fed. Reg. 24,854, at 12 (June 23, 2023), *available at* https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0794-5986. Plants already must comply with the more stringent startup standard, which had a January 2025 compliance deadline. 89 Fed. Reg. at 38,519, 38,564.

At the latest, the emission reductions required by the 2024 Rule must be achieved by the 2027 deadline. But not so for exempted coal plants. Under the terms of the Exemption Proclamations, no emission reductions will be required between 2027 and 2029. Despite the Clean Air Act's limitation of such exemptions to a two-year period, coal plants have *already* stopped working to reduce their emissions or better control their pollution during the present compliance period (as, indeed, the Administration intended): prospective Defendant-Intervenor Talen, an operator and co-owner of an exempted coal plant, stated that 2024 Rule's compliance deadline "would require substantial and immediate expenditures" but that it has "suspended" compliance activities necessary to meet that deadline "[i]n reliance on the Presidential Exemption." Mem. in Support of Mot. to Intervene, at 1-2, ECF No. 29-1. And others have almost certainly followed suit.

The Exemption Proclamation thus delays the benefits of the reductions in emissions from exempted plants' compliance with the 2024 Rule, and prolongs members' exposure to pollution at present, higher levels. Suppl. Compl. ¶¶ 144, 146-153, 155-160. It also delays the benefits of continuous emissions monitoring systems, denying Plaintiffs and Plaintiffs' members information about coal plant emissions. Supp. Compl. ¶¶ 150-51.

ED_021114_00003486-00008

Those consequences flow from the Exemption Proclamation, not from EPA's proposed reconsideration of the 2024 Rule—which did not and could not exempt facilities from compliance with the Rule while it remains good law. The present operation of the Exemption Proclamations is thus denying Plaintiffs' members and the public the benefits that would accrue in the absence of those Proclamations: both the present-day emission reductions from the startup standard and the present and future emission reductions from sources upgrading or installing emissions controls to comply with the 2024 Rule that is presently in force. Indeed, because EPA, state regulators, and exempted coal plants have asserted that certain coal plants must begin preparations *immediately* to be able to meet standards by 2027, a delay in resolving this case could mean compliance by 2027 is not possible, even if the Court ultimately finds it is legally required.[6] *See* Mem. in Support of Mot. to Intervene, at 1-2, ECF No. 29-1 (stating that meeting the 2024 Rule's deadline "would require substantial and immediate expenditures"); *see also* 89 Fed. Reg. at 38,519; Amended Mot. for Stay at 1, 18, *North Dakota v. EPA*, No. 24-1119 (D.C. Cir.) (Ex. 7). Delaying judicial review would thus delay the cleaner air and better health that flows from lower emissions and to which Plaintiffs and their members are legally entitled.

For these reasons, this case cannot wait on hold for six months. Under such an extended delay, Plaintiffs face the "fair possibility" of securing relief too late for exempted plants to achieve compliance by 2027. *Landis*, 299 U.S. at 255. That outcome would "work damage" to Plaintiffs' members, who will be exposed to more mercury and toxic metal pollution from exempted coal plants—pollution that Plaintiffs seek to reduce by having the exemptions declared

[6] Because exemptions may be extended after the two-year period expires, Plaintiffs' members and the public face the prospect of damage to their health and recreational interests for years to come. 42 U.S.C. § 7412(i)(4) ("An exemption . . . may be extended for 1 or more additional periods, each period not to exceed 2 years.").

unlawful. *Id.* For the same reason Defendants issued the exemptions well in advance of the 2024 Rule's deadlines, Plaintiffs have a strong interest in resolving the question of their lawfulness well in advance: the exemptions affect present decisions about the timing of emission reductions.

Defendants have failed to carry their burden of showing a "clear case of hardship or inequity" in proceeding to litigate this case. *Id.* at 255-56 ("the burden of making" the case for a stay "lay heavily" on the movants). Defendants fail to identify any explicit hardship beyond the need to incur the ordinary costs of defending a lawsuit. *See* Mot., at 4, ECF No. 26. Ordinary litigation costs fall short of meeting the heightened standard of a "clear case of hardship or inequity," *Landis*, 299 U.S. at 255-56; *see Lockyer v. Mirant Corp.*, 398 F.3d 1098, 1112 (9th Cir. 2005), and is outweighed by Plaintiffs' interests in protecting the health of their members and the public from unlawful pollution. That is especially true where the action in question concerns *ultra vires* actions of the Executive Branch—and thus where the government's litigation costs have been brought on by their own choice to assert authority not granted to them by Congress.

It would be inequitable for Defendants to evade timely judicial review of the exemptions they chose to issue merely because they chose also to reconsider aspects of the 2024 Rule. That is especially so given that the Clean Air Act expressly limits EPA's ability to stay the effectiveness of a rule during reconsideration "for a period not to exceed three months." 42 U.S.C. § 7607(d)(7)(B). Defendants should not be permitted to use the court to achieve a back-door stay pending reconsideration for exempted facilities.

Moreover, Defendants cannot reasonably claim that their chosen timing obviates any harm from the Exemption Proclamations; Defendants chose to issue exemptions and pursue repeal of the 2024 Rule at the same time, and presumably would not have done so unless they believed the exemptions had their own, present impact. *Landis*, 299 U.S. at 255-56.

ED_021114_00003486-00010

II. Defendants' claim that agency action may, in the future, moot this case does not justify abeyance

Plaintiffs' challenge to the legality of Defendants' Exemption Proclamations presents a live controversy that can be meaningfully remedied and is therefore not moot. *See Samma*, 136 F.4th at 1113 ("A case is moot when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome." (internal quotation omitted)). As explained above, the exemptions are final and in effect — as is the 2024 Rule — and guide the activities exempted coal plants are taking (or not taking) right now. As described in Section I above, harm to Plaintiffs and their members from postponing emissions reductions is ongoing and will only increase as the 2027 deadline grows closer and compliance steps remain unfinished.

That a potential final action by EPA to rescind the 2024 rule "could" moot this case, as Defendants argue, is not sufficient grounds to put the case in abeyance. Where harm is ongoing, timely review is of the essence, and judicial relief would be effective, "the Court is not obligated to step aside, nor have courts made a habit of doing so—even where a case might become moot shortly." *Conservation Law Found. v. Pritzker*, 37 F. Supp. 3d 254, 265 (D.D.C. 2014); *see also Crawford v. FCC*, 417 F.3d 1289, 1294-95 (D.C. Cir. 2005) (deciding case where FCC action would effectively moot the claim, but that action had not yet become final).[7]

As an initial matter, even if EPA adopts its proposal, it could not entirely moot this case: the 2024 Rule consists of several distinct standards and requirements, and EPA does not propose

[7] Other circuits have concluded the same. *See, e.g.*, *Hunt v. Imperial Merch. Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009) (declining to "dismiss a live controversy as moot merely because it may become moot in the near future"); *Muniz v. Sabol*, 517 F.3d 29, 34 (1st Cir. 2008) (controversy "clearly not moot" even where the requested relief would have occurred within a few weeks regardless of the case's outcome); *League of United Latin Am. Citizens v. Bredesen*, 500 F.3d 523, 530 n.5 (6th Cir. 2007) (deciding case where superseding legislation would inevitably moot controversy, but law did not take effect for another month).

to repeal or modify *all* of them. For instance, EPA stated that it is "not reconsidering" the more stringent startup standard. 90 Fed. Reg. 25,535, 25,539 n.6 (June 17, 2025). The Exemption Proclamation, on the other hand, exempts power plants "from compliance with the Rule," which seemingly includes the 2024 Rule's startup standard. 90 Fed. Reg. 16,777 (Apr. 21, 2025). Plaintiffs' counts one, two, and three of their complaint encompass a challenge to the Exemption Proclamation as it relates to compliance with the startup standard. *See* Suppl. Compl. ¶¶ 79-83, 164, 173, 177-179, 183-184. Thus, aspects of the Exemption Proclamation would remain a live controversy even if the rule is finalized as proposed.

In any event, any mootness assessment is premature under the circumstances: We know neither *what* action EPA will take on its proposal, nor *when* it will take it. EPA has only *proposed* to repeal aspects of the 2024 Rule; it must now consider and respond to public comments on that proposal. *See* 42 U.S.C. § 7607(d)(5), (6)(B). The Clean Air Act and Administrative Procedure Act require that EPA's rulemakings be based on consideration of law, data, factual findings, and reasoned decision-making, and reflect input from the public. 42 U.S.C. § 7607(d); 5 U.S.C. § 553. These requirements "ensure that agency regulations are tested via exposure to diverse public comment," and provide "notice and the opportunity to be heard" as an essential component of "fairness to affected parties." *Int'l Union, UMW v. Mine Safety & Health Admin.*, 407 F.3d 1250, 1259 (D.C. Cir. 2005) (cleaned up) (citing *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 547 (D.C. Cir. 1983)).

So, although EPA *could* finalize the action as proposed at the conclusion of the notice and comment process, it runs counter to the core principles of agency responsiveness to public comment to *presume* that it will. EPA also might issue an action with "major changes" from the proposal — which may not ultimately moot the present controversy. *See* 42 U.S.C.

ED_021114_00003486-00012

§ 7607(d)(6)(A). Indeed, because the Exemption Proclamation exempts the listed coal plants "from compliance with the Rule," 90 Fed. Reg. at 16,777, leaving even a single requirement of the 2024 Rule in place keeps the issues presented in this case "live" and capable of being remedied. *Larsen v. U.S. Navy*, 525 F.3d 1, 3-4 (D.C. Cir. 2008). EPA could also decide to modify its approach and issue a new proposal,[8] or to rescind the proposal altogether. The Court should not stay this case on the mere possibility the 2024 Rule will be repealed as proposed.

We also do not know *when* EPA will take final action on its proposal. Defendants characterize EPA's intention to promulgate a final rule by December 2025 as a "goal," and it is just that. *See* Mot. at 4, ECF No. 26. EPA is not subject to any legal requirement to act by December 2025 or any other date. A nonbinding statement located on a website expressing EPA's intent to act before the end of the year is not sufficiently concrete to warrant abeyance. *See Am. Petrol. Inst. v. EPA*, 683 F.3d 382, 389 (D.C. Cir. 2012) (emphasizing that a settlement required EPA to issue a final rule by a "definite end date"). Indeed, the D.C. Circuit has cautioned that agencies cannot "stave off judicial review of a challenged rule simply by initiating a new proposed rulemaking that would amend the rule in a significant way." *Id.* at 388.

In any event, if history is any guide, final action is far from imminent. December 2025 is an ambitious goal. In practice, it can take EPA a year or longer to finalize action after the notice

[8] In fact, EPA requested comment on alternative standards that the Agency should consider in lieu of repealing the 2024 Rule fPM and mercury standards. 90 Fed. Reg. 25,535, 25,544-45 (June 17, 2025). Plaintiffs are among thousands of commenters on EPA's proposed repeal, and commented, among other things, that there *are* cost-effective intermediate standards. *See, e.g.*, Air Alliance Houston et al., Comments of Public Health and Environmental Organizations on Proposed Rule on National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Unit (June 17, 2025) (forthcoming at regulations.gov), *available at* https://tinyurl.com/y2uhtnhk.

ED_021114_00003486-00013

of proposed rulemaking.[9] Indeed, the Agency's last three MATS rulemakings each took more than a year between proposed and final action. *See, e.g.*, 2024 Rule at 38,509 (notice of proposed rulemaking published on April 24, 2023; final rule published on May 7, 2024); National Emission Standards for Hazardous Air Pollutants: Coal-and Oil-Fired Electric Utility Steam Generating Units Revocation of the 2020 Reconsideration and Affirmation of the Appropriate and Necessary Supplemental Finding, 88 Fed. Reg. 13,956 (Mar. 6, 2023) (proposed rule published February 9, 2022) National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Reconsideration of Supplemental Finding and Risk and Technology Review, 85 Fed. Reg. 31,286, 31,286-87 (May 22, 2020) (proposed rule published February 7, 2019). Especially in an area of great complexity and public interest, there is reason to doubt that EPA will be able to respond to those comments and finalize a rule in half its typical time.

In contrast, Plaintiffs believe they can proceed expeditiously, with dispositive motions fully briefed this fall. Considering the likelihood of delay in meeting the December 2025 "goal," Plaintiffs are well-positioned to obtain relief before EPA takes final action.

Finally, proceeding with this litigation while EPA's rulemaking proceeds does not present the concerns identified in *American Petroleum Institute v. EPA*, 683 F.3d 382 (D.C. Cir.

[9] EPA has asserted as much in signed declarations concerning other rules issued under Section 7412. *See, e.g.*, Decl. of Penny E. Lassiter ¶ 4 & tbl., rows 8-10 (Nov. 4, 2024) (submitted in *Blue Ridge Env't Defense League v. Regan*, No. 1:22-cv-03134, ECF No. 36 (D.D.C.) (attached as Ex. 8) (stating that the "earliest possible completion date" for a Clean Air Act Section 7412 rulemaking on hazardous waste combustors was 10 months from proposal to final rule); Decl. of Panagiotis E. Tsirigotis ¶ 16 tbl. 3, row 4, ¶¶ 22-24 (Oct. 19, 2017) (submitted in *Sierra Club v. Pruitt*, No. 1:16-cv-02461-TJK, ECF No. 13-3 (D.D.C.) (attached as Ex. 9) (identifying the "minimum number of days" for a Clean Air Act Section 7412 technology review rulemaking on solid waste incinerators as one year from proposal to final rule).

ED_021114_00003486-00014

2012), and the other authorities Defendants cite in support of abeyance. Those cases arose in the context of an agency's reconsideration of the very rules being challenged in the litigation they sought to abate. *See, e.g.*, *id.* at 386-88. Here, by contrast, Defendants seek abeyance of litigation challenging the Exemption Proclamations because EPA is reconsidering an independent agency action, the 2024 Rule. The *exemptions* are not being reconsidered and will not be terminated by whatever action EPA decides to take on the 2024 Rule; the Court is not being asked to review an action that is itself "tentative" or subject to change or "eliminat[ion]." *Id.* at 387-88. And this is not a matter where, as in *Center for Biological Diversity v. EPA*, 56 F.4th 55, 60-61 (D.C. Cir. 2022), *see* Mot. at 4, ECF No. 26, the parties reached a private settlement and jointly requested abeyance to allow time for the settlement's implementation.

Defendants' motion should be denied.

III. The Court should deny Defendants' alternative request to further extend the responsive pleading deadline

The Court should also deny Defendants' alternative request for a 21-day extension of their deadline to respond to Plaintiffs' complaint. The deadline has been extended twice already, and Defendants have not shown good cause for extending it further. This case has been pending since June. Nothing about the abeyance motion, or the Court's ruling on it, affects *how* Defendants respond to the complaint. The Court should deny their extension request.

CONCLUSION

For the reasons stated above, the Court should deny Defendants' motion for a six-month abeyance and for a further extension of Defendants' responsive pleading deadline.

EXHIBIT 1

Declaration of Stephanie Coates

DECLARATION OF STEPHANIE COATES

I, Stephanie Coates, declare as follows:

1. I submit this declaration on behalf of Environmental Defense Fund ("EDF") to support its litigation challenging President Trump's Proclamation, *Regulatory Relief for Certain Stationary Sources To Promote American Energy*, 90 Fed. Reg. 16777 (Apr. 21, 2025) ("Exemptions Proclamation"), exempting sources from compliance with the U.S. Environmental Protection Agency's ("EPA") final rule: National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 86 Fed. Reg. 38508 (May 7, 2024) ("Final Rule").

2. I am a Climate & Health Project Manager at, and a member of, EDF. I work out of Houston, Texas, where I have lived since 2013. In my role as Climate & Health Project Manager I oversee a project that seeks to characterize concentrations of air toxics in Houston through mobile air monitoring and use these data in conjunction with health data from community health centers to assist community partners in creating disaster response plans. Prior to this role, I was a Community Air Quality Fellow with EDF working directly with grassroots, community-based organizations on their environmental justice priorities with air quality being a concern among all the groups we work with in Houston. EDF also worked with the City of Houston and the community groups to create an automated

air quality report that is generated weekly using data from the community networks and local and state monitors to identify areas with the most National Ambient Air Quality Standards ("NAAQS") exceedances and pinpoint locations with readings above thresholds. The report also includes weather data to identify the likeliest source of the pollution at the time of exceedance. Additionally, EDF engaged with community-based organizations to inform the development of the Climate Vulnerability Index[1] a tool combining 184 different datasets to rank more than 70,000 census tracts to see which communities face the greatest challenges from the impacts of a changing climate. Harris County ranks in the 85th national vulnerability percentile. Census tracts for the community groups we work with in Harris County rank among the top 10% most vulnerable in the nation. Environmental data included in the Climate Vulnerability Index give an indication of a census tract's proximity to transportation sources and exposures to and health risks from other stationary air pollutant sources. As a Fellow, I also supported the community groups in their successful application for an EPA Community Air

[1] *See*, U.S. Climate Vulnerability Index, Overall Climate Vulnerability for Tract 4820121250, https://map.climatevulnerabilityindex.org/map/cvi_overall/tract-48201212500-northeast-houston-houston-tx?mapBoundaries=Tract&mapFilter=9&reportBoundaries=Tract&geoContext=State (showing data for the Houston area).

Quality Monitoring Grant. The main goal of that award will be to conduct mobile monitoring for ethylene oxide, 1,3-butadiene, formaldehyde and acrolein.[2]

3. I understand that the Final Rule addresses toxic pollution from coal-fired power plants by (1) lowering the mercury emission standard for coal plants burning lignite coal; (2) lowering the emission standard for toxic metals such as chromium, nickel, arsenic, lead and others for coal plants; (3) requiring coal plants to use continuous emissions monitoring systems to demonstrate compliance with the standard for non-mercury toxic metals; and (4) updating the definition of "startup" to require coal plants to turn on pollution controls more quickly upon startup. I understand that the Final Rule requires coal plants to comply with the first three requirements by July 8, 2027 and has required coal plants to comply with the new "startup" definition since January 2, 2025.

4. I am also aware that the Exemptions Proclamation exempted 68 coal plants from the Final Rule's standards through July 8, 2029. See EPA, Presidential Proclamation – Regulatory Relief for Certain Stationary Sources to Promote American Energy, at https://www.epa.gov/stationary-sources-air-pollution/presidential-proclamation-regulatory-relief-certain-stationary (providing Annex 1 list of sources exempted by the President).

[2] *See*, EPA, EPA Awards Nearly $500,000 to Texas Organization to improve Air Quality in the Houston Area (Nov. 29, 2023), https://www.epa.gov/newsreleases/epa-awards-nearly-500000-texas-organization-improve-air-quality-houston-area#:~:text=The%20main%20goal%20is,butadiene%2C%20formaldehyde%2C%20and%20acrolein.

5. EDF is deeply engaged in efforts to use monitoring data to inform the public about air pollution, and as explained above, I have been involved in some aspects of this work.[3]

6. EDF has also assisted community groups in Pleasantville, Fifth Ward and Sunnyside to install community-owned air sensor networks measuring particulate matter 2.5 ($PM_{2.5}$), nitrous dioxide (NO_2), and volatile organic compounds. Even though these neighborhoods are overburdened by sources of air pollution such as concrete batch plants/crushers, freeways, metal recyclers, refineries and other industrial activities, the nearest regulatory air monitors are several miles away. By installing their own sensor networks, they are able to identify concerning trends of particulate pollution above NAAQS and with dangerous peaks affecting public health. With EDF's support, community-based organizations in Fifth Ward and Pleasantville were able to successfully advocate for additional state regulatory air monitors to be sited in their neighborhood and increased monitoring and enforcement by County and City officials.

7. EDF has been working with the community of Sunnyside on the southside of Houston since 2020. After a community assessment and asset mapping, residents recognized that the abundance of pollution sources nearby was

[3] *See also* Comments of EDF on Texas Commission on Environmental Quality Proposed 2025 Annual Monitoring Network Plan (May 14, 2025).

directly impacting their health. Zip codes in Sunnyside are considered to have "high asthma burden" due to high utilization of emergency services to treat asthma attacks. EDF encouraged community leaders to join the City of Houston Asthma Coalition to educate residents on asthma management practices. EDF assisted community leaders in Sunnyside to install their air sensor network in 2021 and EDF has provided technical assistance to help residents understand and use the data, which show average $PM_{2.5}$ concentrations in 2023 measuring above NAAQS of 9 $\mu g/m^3$ 62% of the time. EDF is supporting Sunnyside's request that the Texas Commission on Environmental Quality include deployment of a new regulatory monitor in their neighborhood as part of the 2024 Air Monitoring Network Plan. Having information about emissions is essential to understanding public health impacts in these communities. Monitoring data from facilities is essential to ensuring that there is information about the air pollution communities are exposed to.

8. I am aware that sources that are major under Clean Air Act Section 112 are subject to the Clean Air Act's Title V permitting requirements. Title V requires that "a copy of each permit application, compliance plan including the schedule of compliance), emissions or compliance monitoring report, certification, and each permit. . . shall be available to the public." 42 U.S.C. § 7661b(e).

9. Prior to the Final Rule, coal plants that are major could choose to submit only quarterly stack testing results to EPA to demonstrate their compliance with the limits on toxic metals. With the Final Rule's requirement for plants to use continuous emissions monitoring systems, plants will submit hourly compliance data instead of being allowed to submit data from just four test days per year. I understand EPA requirements will further compel coal plants to report their continuous emissions monitoring data to the Emissions Collection and Monitoring Plan System, allowing the public to easily locate, review, and download emissions data using simple, user-directed inquiries. This provides a vital benefit to communities by enabling their access to more comprehensive pollution exposure data that can be used to evaluate individual and community health impacts. This also benefits EDF in its organizational goals to understand and increase awareness of exposure to air toxics and to limit those exposures.

10. Communities are often concerned about emissions from nearby sources of pollution such as coal plants. Having access to hourly source-specific monitoring data that is required to be made available under the Final Rule and Clean Air Act Title V helps reveal the air pollution communities are exposed to and whether additional measures need to be taken in order to reduce pollution from these sources. For example, this data may reveal that a facility is having difficulty with their pollution controls, or that they are not adequately maintaining their

facility as needed to control emissions. Communities can use this data to advocate for better enforcement and compliance by local and state regulatory agencies. Additionally, continuous emissions monitoring will provide residents with more granular information about emissions from nearby coal plants, information they can use to make decisions to better protect their health, for example, whether or not to spend time outdoors, or if it is necessary to use personal protective equipment or air filters in homes and schools.

11. I understand that EPA determined that continuous emissions monitoring could further reduce emissions of non-mercury metals by providing power plant operators with more frequent emissions data, allowing them to quickly identify and address issues with pollution control devices not functioning as expected.[4] EPA determined that this would likely reduce exposures to people living near coal-fired power plants subject to the updated non-mercury toxic metal standard.[5]

[4] EPA, National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 89 Fed. Reg. 38508, 38536-37 (May 7, 2024).
[5] *Id.*

12. EDF frequently uses information about sources of air pollution to inform blog posts, reports, fact sheets, and other materials to increase public awareness of threats of air pollution from particular facilities.[6]

13. EDF's ability to carry out its organizational mission to build a vital Earth for everyone is greatly benefited by the Final Rule's new monitoring requirements. The Final Rule allows EDF to expend fewer resources towards obtaining information about sources of air pollution in order to communicate threats about air pollution exposures to the public.

[6] *See, e.g.*, EDF & Environmental Integrity Project, Trump EPA Pollution Pass Map (2025), https://www.edf.org/maps/epa-pollution-pass; EDF, Making the invisible visible: A guide for mapping hyperlocal air pollution to drive clean air action (Oct. 1, 2019), https://www.edf.org/sites/default/files/content/making-the-invisible-visible.pdf; Matt Tresaugue, Houston neighborhood maps decades-old pollution problem, paving way for communities nationwide (Oct. 26, 2018), https://www.edf.org/blog/2018/10/26/houston-neighborhood-maps-decades-old-pollution-problem-paving-way-communities; Jeremy Proville, Understanding how communities are vulnerable to climate change is key to improving equity and justice (Mar. 29, 2023), https://blogs.edf.org/markets/2023/03/29/understanding-how-communities-are-vulnerable-to-climate-change-is-key-to-improving-equity-and-justice/; EDF Business, How Houston's model could change the way cities map air pollution, https://business.edf.org/insights/how-houstons-model-could-change-the-way-cities-map-air-pollution/; EDF, EPA Finds Valero Energy "Significantly Underestimated" Release of Pollution in Houston (Sep. 4, 2017), https://www.edf.org/media/epa-finds-valero-energy-significantly-underestimated-release-pollution-houston; EDF, Finding pollution – and who it impacts most – in Houston (Jun. 3, 2020), https://www.edf.org/airqualitymaps/houston/findings; EDF, Texas Explosion Underscores Need to Hold Polluters Accountable, Protect Community Health (May 6, 2023), https://www.edf.org/media/texas-explosion-underscores-need-hold-polluters-accountable-protect-community-health; Jolie Villegas, We Need to Close a Mercury Pollution Loophole for Lignite Coal Plants (Apr. 12, 2024), https://blogs.edf.org/climate411/2024/04/12/we-need-to-close-a-mercury-pollution-loophole-for-lignite-coal-plants.

14. If coal plants are exempted from the Final Rule until 2029 or longer, EDF will be harmed by the loss of access to this monitoring data for two or more years.

15. As someone who lives and works in Houston, Texas, I have concerns about my exposure to pollution from coal plants, including mercury, which I understand is associated with harms to the nervous system, kidney, and cardiovascular system, and from toxic metals like selenium, chromium, nickel, cobalt, cadmium, beryllium, lead, and manganese which I understand are associated with a variety of health effects including the potential to cause cancer. From my work I know that Houston air quality is plagued by the heavy presence of polluting industry, including coal-fired power plants.

16. On June 4, 2024, I was diagnosed with non-hereditary breast cancer. I am concerned that the persistent presence of air pollution in my community, including the toxic pollution from coal plants that includes known carcinogens, could have increased my risk of developing cancer. I am also concerned that the ongoing toxic pollution from nearby coal plants will exacerbate my health condition and detract from my quality of life.

17. I am concerned about my exposure to air pollution when my family and I spend time outdoors. My family only has one car, which is primarily used by my partner. When I need to run errands or go to appointments during the day, I

usually walk or bike. My family and I regularly walk to the park, coffee shop or to family's house on the weekends. My children walk to school and have recess outdoors most days. As children grow, their developing lungs and brains make them especially vulnerable to air pollution since they breathe more rapidly and inhale more air relative to their size than adults. I receive air quality alerts from the Texas Commission on Environmental Quality and have the Air Quality Index on my smartwatch face, so I am always aware of conditions. If the air quality is unhealthy for sensitive groups such as children, we limit our time outdoors. When there have been air pollution incidents like chemical fires in our region, I use the Clarity openmap and EDF Air Tracker tools to try to understand the threat to my area. I'm grateful that I am aware of such tools so that I can make decisions to protect my and my family's health.

18. We have several coal plants in the surrounding area. The closest coal plant to my home is the W.A. Parish Coal Plant. It is 25 miles from my home. Outside of Houston are also the Martin Lake plant in Tatum; the Oak Grove plant in Petteway; and the San Miguel plant in Christine. I am aware that these plants burn lignite coal, one of the dirtiest types of coal that produces high amounts of mercury emissions. I understand the Final Rule will place a more stringent emissions limit for non-mercury toxic metals for these plants, require them to use continuous emissions monitoring to demonstrate compliance with the limit on non-

mercury toxic metals, and require them to abide by more stringent startup conditions. I understand the Final Rule will require the Martin Lake, Oak Grove, and San Miguel plants to reduce their emissions of mercury.

19. I also understand that all four of these plants are listed on "Annex 1" as plants that the Exemptions Proclamation exempts from the Final Rule's requirements through July 9, 2029. *See* Regulatory Relief for Certain Stationary Sources To Promote American Energy, 90 Fed. Reg. 16777 (Apr. 21, 2025); EPA, Presidential Proclamation Regulatory Relief for Certain Stationary Sources to Promote American Energy, at https://www.epa.gov/stationary-sources-air-pollution/presidential-proclamation-regulatory-relief-certain-stationary (providing Annex 1 list of sources exempted by the President).

20. The Exemptions Proclamation effected these suspensions of the Final Rule's requirements without rulemaking notice and an opportunity for me to comment, or for EDF to comment on my behalf.

21. If I were given an opportunity to comment, or had EDF had the opportunity to comment on my behalf, I could have shared information about my exposures to air pollution and my concerns about my and my family's health as a result of pollution from coal plants and EDF could have shared information about the availability of technology needed for coal plants to comply with the Final Rule.

22. Suspending the Final Rule's CEMS monitoring requirement harms me and EDF by denying me and the organization more detailed and regular information about coal plant toxic emissions that would have otherwise been available under the Final Rule. The exemptions mean we will instead need to rely on infrequent stack test information based on tests conducted merely four times a year.

23. I believe the Final Rule's requirements will lead to improved air quality in the Houston area where I live, work, and raise my children. The Exemptions Proclamation harms me and my family by permitting coal plants to emit more pollution during the period of exemption than they would otherwise emit if required to comply with the Final Rule according to its original compliance schedule.

24. The harms to me and my family would be redressed by a Court Order preventing federal authorities from implementing, enforcing, or recognizing the exemptions. Such a Court Order would ensure that coal plants install the emissions controls necessary to comply with the Final Rule and reduce the pollution harming my family and me.

I declare under the penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed in Houston, TX on May 30, 2025.

Stephanie Coates

EXHIBIT 2

Declaration of Michelle L. Marley-Knox

DECLARATION OF MICHELLE L. MARLEY-KNOX

I, Michelle L. Marley-Knox, declare as follows:

1. My name is Michelle L. Marley-Knox. I am a citizen of the United States, am over 18 years of age, and am competent to give this declaration. All of the information provided is based on my own personal knowledge unless otherwise noted.

2. I am a member of the Environmental Law & Policy Center ("ELPC") and have been involved with ELPC since approximately 2018. ELPC was instrumental in partnering with a coalition of solar businesses that I formed in 2018 and has since provided assistance to me and my business related to energy policy.

3. I currently live in Owaneco, Illinois and have been in my current home since March of 1989. I have lived within thirty miles of the Kincaid power plant for my entire life and often see the pollution it emits from its coal stacks.

4. I own WindSolarUSA, Inc., a renewable energy development company that focuses on designing and installing solar photovoltaics for residential, commercial, and agricultural applications. I formed WindSolarUSA, Inc. in September of 2008 in an effort to offer Illinoisans a level of self-sufficiency and sustainability utilizing clean energy products. We serve Central and Southern Illinois. I have customers living near the Kincaid power plant, including in Taylorville, Glenarm, Rochester, Auburn, Pawnee, Chatham, and Springfield, who have all made a choice to use clean energy for the production of their electricity in an effort to reduce our dependence on fossil fuels.

5. I have completed significant training through the Midwest Renewable Energy Association and am an active member of the Illinois Clean Jobs Coalition, the Illinois Environmental Council, Sierra Club, the Natural Resources Defense Council, and other

organizations through which I take ongoing training to stay abreast of environmental and energy issues that affect our state, nation, and world. I have also served as an instructor of Solar Photovoltaics at Lincoln Land Community College and participate in Workforce Development Program interviews and feedback opportunities in terms of creating clean energy jobs in Illinois.

6. I am involved in community and advocacy work related to environmental and energy issues. I participate every year in the Illinois Environmental Council's Lobby Days in Springfield, Illinois to educate legislators about the importance of clean air, water, and soil. I also work to educate utilities about the importance of using storage to supplement their ability to store and dispatch clean energy in times of peak demand to avoid having to engage peaker plants that are generally aging and tend to be the dirtiest of our generating facilities.

7. I engage with environmental and clean energy issues in both my business and volunteer work because it is important to me that future generations are able to enjoy clean air, clean water, and safe food.

8. I enjoy outdoor recreational activities near the Kincaid power plant such as bicycling on the path from Taylorville to Pana and water activities at Shelbyville Lake. I have always enjoyed fishing, and I grew up fishing with my father in Kincaid Lake. As an adult, I used to enjoy camping at Sangchris Lake State Park and fishing in Sangchris Lake and Taylorville Lake. My friends and I had a lake lot on Taylorville Lake until a few years ago. Each of these lakes is near the Kincaid plant.

9. Over recent years, I have come to understand that the waters in the lakes surrounding the Kincaid plant are contaminated by mercury and other pollutants stemming from the Kincaid plant. Mercury and other hazardous pollutants emitted into the air end up in fish because they settle into lakes or are washed into the water after settling on the ground. I understand

that fish in contaminated lakes can contain mercury, which is dangerous to human health. I have needed to stop fishing and swimming in the water in recent years due to the polluted water.

10. I understand that compliance with the 2024 MATS Rule would improve air and water quality, provide accessible up-to-date emissions information, and help facilitate a transition to clean energy. I understand that the exemption from compliance with the 2024 MATS Rule given to the Kincaid power plant could lead to it operating as a coal-fired power plant for longer than planned and/or being subject to less stringent air toxics standards and monitoring requirements. This would increase air and water contamination.

11. Everyone in my family suffers from a susceptibility to bronchitis at least once per year. We each must carry inhalers to use as needed for wheezing and shortness of breath. An increase in emissions of hazardous air pollutants from coal-fired power plants will adversely affect my health and the health of my family. Further, a lack of up-to-date emissions information would prevent my family and me from effectively evaluating the personal health risks we are exposed to on a day-to-day basis.

12. I looked forward to the positive impacts of the 2024 MATS Rule and the planned closure of the Kincaid power plant so that I could enjoy camping and fishing in the nearby lakes again without concerns for my health. If mercury and air toxics emissions continue to increase, my ability to enjoy fishing and other outdoor recreational activities will be greatly compromised and will degrade my quality of life.

13. Through my work, I know that Illinois has an aggressive Renewable Portfolio Standard ("RPS") that currently has a goal of 40% renewable energy for investor-owned utilities by 2030. That RPS is complimented by the IL Shines Program, which incentivizes all Illinoisans to choose solar energy. Granting an exemption to the 2024 MATS to the Kincaid plant and other

plants in Illinois goes against our state's goals and serves to keep Illinois dependent on sources of energy that have harmful effects to our air and water. This would result in chilling the urgency of people making clean energy choices, which would impact not only our environment and public health, but also the success of my own clean energy business. This exemption, if allowed to stand, will compromise the financial wellbeing of my business.

14. Exempting the Kincaid power plant from the 2024 MATS Rule will significantly jeopardize my personal, health, recreational, and financial interests.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct to the best of my knowledge.

Dated: May 29, 2025

Michelle L. Marley-Knox

Michelle L. Marley-Knox

EXHIBIT 3

Supplemental Declaration of Michelle L. Marley-Knox

SUPPLEMENTAL DECLARATION OF MICHELLE L. MARLEY-KNOX

I, Michelle L. Marley-Knox, declare as follows:

1. My name is Michelle L. Marley-Knox. I am a citizen of the United States, am over 18 years of age, and am competent to give this declaration. All of the information provided is based on my own personal knowledge unless otherwise noted.

2. I signed a declaration on May 29, 2025 as a member of Plaintiff Environmental Law & Policy Center in *Air Alliance Houston v. Trump*, No. 1:25-cv-01852 (D.D.C.), filed on June 12, 2025. All of the information in that declaration remains true and accurate. I give this supplemental declaration to assert new facts which were not relevant at the time of my initial declaration.

3. I recently learned that a July 17, 2025 Presidential Proclamation extended an exemption from compliance with the 2024 MATS Rule to the Dallman Power Plant, Unit 4 ("Dallman 4"), in Springfield, Illinois.

4. I live within approximately forty miles of Dallman 4.

5. I serve as an advisor to Sustainable Springfield, Inc., and am helping to provide comments and information to City Council about creating an energy mix within the city that incorporates more solar and battery storage to help shave peak demand and levelize energy costs for ratepayers.

6. Dallman 4 sits on Lake Springfield. There are many public parks directly across the lake from Dallman 4. I have hosted birthday parties in these parks, attended functions/fundraising events at clubs around the lake, and kayaked the lake. Though I would like to get in the water, swim, and/or fish, I cannot partake in these activities due to concerns about the water quality amplified by the close proximity of Dallman 4.

7. My business, WindSolarUSA, has done many residential installations of solar PV systems in CWLP territory (Springfield's municipal utility). We have also done several installations in Rochester, Illinois, and around Lake Springfield, all of which are close to Dallman Unit 4's coal fired stacks.

8. Given the proximity of Dallman 4 to my home and work sites, I redeclare the health, financial, recreational, and personal interests outlined in my initial declaration as they are similarly threatened by the exemption given to Dallman 4.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct to the best of my knowledge.

Executed on: 8/8/2025

Michelle L. Marley-Knox

Michelle L. Marley-Knox

EXHIBIT 4

Declaration of Derf Johnson

DECLARATION OF DERF JOHNSON

I, Derf Johnson, declare as follows:

1. I am over 18 years of age and competent to give this declaration. I have personal knowledge of the following facts, and if called as a witness could testify competently to them. As to those matters which reflect an opinion, they reflect my personal experience, opinion and judgment on the matter.
2. I am a lifelong resident of Montana, and currently reside in Helena, Montana.
3. I have been a member of the Sierra Club since 2018. I am also a member and an employee of the Montana Environmental Information Center ("MEIC"), at which I currently serve as Deputy Director and am responsible for overseeing and supporting programs seeking to maintain a clean and healthful environment for all Montanans. In those capacities, I have worked to address the environmental problems associated with natural resource extraction, with a specific focus on fossil fuel development and climate change.
4. I am a graduate of the University of Montana School of Law. I chose to stay in Montana after law school and begin my career in environmental and natural resources law. I regularly testify before the Montana legislature, state boards, and commissions, on the environmental impacts associated with energy development in Montana, including testimony on the pollution associated with such development. I feel strongly that Montana is one of the most beautiful and spectacular landscapes on Earth and must be protected.
5. I enjoy a variety of outdoor recreational activities. My hobbies include fishing, swimming, floating on water bodies and riverways, and hunting. I also find great joy in

observing the state's abundant wildlife, including bald eagles, elk, and grizzly bears. I spend a majority of my leisure time outdoors and regularly travel around the state.

6. I have regularly visited the Colstrip area for over a decade for both work and leisure purposes. When I first started working at MEIC, I would travel to the Colstrip area once every few months to meet with our members and assess the ecological and policy issues in the area. Since 2016, I travel to the Colstrip area at least one to two times a year. My most recent visit to Colstrip was in August 2024 where I witnessed and photographed devastating ecological damage from the expansion of the Rosebud mine, the coal mine directly adjacent to the Colstrip plant that exclusively supplies its coal, as well as the power plant. I will continue visiting Colstrip and the surrounding area for both work and pleasure, and I am currently planning a trip to southeastern Montana, including the Colstrip area, in mid-June of 2025.

7. I've always had an appreciation for the beautiful landscape of Eastern Montana with its sandstone cliffs, grasslands, rolling hills, and Ponderosa Pine stands. Southeastern Montana in particular is one of the more beautiful and majestic places that I've had the good fortune of visiting. However, on my trips to Colstrip over the past decade, it is really shocking to have watched the landscape continue to degrade because of the Colstrip power plant and associated mining operations. It is disconcerting to see the billowing smokestacks of toxic chemicals in the midst of an otherwise beautiful town with abundant wildlife. The air pollution and other damage I have witnessed, caused by the Colstrip plant, significantly degrades my experience visiting southeastern Montana. At times, I've seen Colstrip's pollution billowing into the sky on the horizon from thirty or forty miles away.

8. I am aware that coal-fired power plants, including Colstrip, emit mercury, toxic metals, particulate matter, sulfur dioxide, nitrogen oxides, and other pollutants which have been linked to serious health complications. I am also aware that these pollutants can be significantly mitigated with pollution controls which the Colstrip plant operators have for decades refused to install. When I'm visiting the area surrounding Colstrip, I'm concerned that I'm being exposed to the hazardous air pollution emitted by Colstrip and the health harms it may cause. My potential exposure to these hazardous air pollutants in the Colstrip region diminishes my enjoyment of activities and makes me concerned for my personal wellbeing. I also know that certain populations are at higher risk for these complications, and it disgusts me that despite evidence on the public health impacts of pollution, modern industry standard pollution controls are not in place at the Colstrip facility. It's alarming that Colstrip knowingly emits harmful pollutants that are linked to illness and death when there are proven technologies to reduce emissions at most (if not all) coal fired power plants in the same class as the Colstrip plant.
9. I have also visited and hunted in the Tongue River Valley on a private ranch about 40 miles as the crow flies from the Colstrip plant. I have every intention to continue visiting the ranch in the future. However, I am deeply concerned about my health and the health of the wildlife that live in this region. Wildlife breathe air and drink water just like people, and I am worried about what kinds of ailments may result from living downwind of the ongoing pollution from the Colstrip plant. I am also aware of the poisoning risks associated with consuming wildlife with bioaccumulated toxics in their tissues. My worry ultimately diminishes my enjoyment of hunting and outdoor recreation in the area, but especially when I am skeptical of being able to safely consume my game.

10. I am aware that the EPA - through the Mercury and Air Toxics Standards ("MATS")- set standards to reduce toxic pollution from coal-fired power plants, which reduces the impact of this pollution. I also understand that EPA has recently updated those standards in a new Technology Review for coal-fired power plants. As a result of that review EPA has, among other things, set lower standards for particulate matter, as a surrogate for toxic metals, emitted by the Colstrip and other coal-fired power plants.
11. I wholeheartedly believe that clean air is absolutely critical for sustaining life in the region. I also do not enjoy being exposed to these pollutants when I travel to the Colstrip area for work or when I am traveling through the town to other locations. I am concerned about the ongoing pollution from the Colstrip power plant from an environmental and public-health perspective.
12. In its rule, EPA established July 2027 as the compliance deadline for the strengthened standards, allowing Colstrip 3 years to achieve compliance. Based upon the amount of pollution that has already been released from Colstrip's sub-par pollution control technology, I view this timeline as incredibly generous. I am extremely concerned that the President has granted an additional 2-year exemption from compliance to Colstrip.
13. I am confident that I would be harmed if Colstrip was able to avoid the new MATs standards for an additional two years. Emissions of particulate matter (including toxic metals) from Colstrip and other existing coal plants would continue at high levels during this time, therefore prolonging the amount of air pollution to which I, my family, and my friends are exposed. If this level of pollution were to continue at the current harmful levels for an additional two years, I would feel less safe on my work and recreational trips to the area, and my enjoyment in doing so would be reduced.

14. If the Colstrip plant were required to reduce its pollution levels during this time, I would feel much more comfortable visiting the area knowing that I'm less likely to be exposed to toxic pollution and would consider visiting the Colstrip area more often.
15. For these reasons, I support MEIC's lawsuit challenging the MATS exemptions and the attempt to stop them from having effect. I believe that if Colstrip is not exempted from compliance with the strengthened MATS Rule by July 2027, my concerns over air pollution and toxic exposure would be at least partially alleviated.

I declare under penalty of perjury that the foregoing is true and correct. Executed this 22nd day of May 2025, in Helena, Montana.

Dert Johnson

EXHIBIT 5

Declaration of Catherine Fleischman

DECLARATION OF CATHERINE FLEISCHMAN

I, Catherine Fleischman, hereby declare as follows:

1. I am currently a member of the Natural Resources Defense Council ("NRDC") and joined in 2025.

2. I live in Davis, West Virginia. I have lived at my current residence full time since 2024, and I have lived here part time since 1999.

3. I spend a significant amount of time outside. I bought this property 30 years ago and retired here specifically because I spend a lot of time outside. I mountain bike, cross country ski, hike, and camp. I am a master naturalist, an avid birder, and I am on the trail maintenance board of the Heart of the Highlands.

4. I personally do not have asthma, but I have concerns that because of environmental deregulation, I will not know what the quality of my air is. I remember in the 1970s that we worked to address the impact of acid rain and smog, and I know of the impact of these and other environmental harms. We have seen huge improvements in air quality since the 1970s, but without regulations, we will not have any ability to know if our air is damaged or unsafe. I am also concerned about my neighbors who are particularly sensitive to air quality – some are on oxygen or have difficulty breathing, and I am concerned about them.

5. I was in West Virginia when the fires in Canada brought all the smoke and haze to our air and I am concerned about coal companies having all the say

about what is in the air – it's everyone's air, not just the coal companies' air! If there were such a thing as clean coal, I would support it, but the current administration gives me no indication that the coal is "clean," as they put it. I am aware that fossil fuels pollute, and coal is a fossil fuel. Mt. Storm burns fossil fuels. There has to be a strong regulatory system to combat the effects of putting pollutants in the air. Davis, West Virginia, where I live, is a high elevation bog, which means that air quality tends to bottle up here because of the valley and the high elevation of the mountains surrounding it. This is a process called inversion, so I'm particularly worried about air quality in my area that results from pollution.

6. I keep track of the air quality in my area by looking at the NOAA website. There is also a weather station near Dolly Sods that reports air quality data, and we often get data from here. We are in an area where cold air sinks and we often record the lowest temperatures in the lower 48. This tendency keeps pollutants in our area longer. I look at my smartphone or check the news for information on air quality every day. If the air quality is bad, I try to limit my outdoor activities, because if I don't, I notice fatigue and lethargy from poor air quality. I have a dehumidifier that filters air quality in my house and an air conditioner unit in my house that filters air.

7. I am concerned about the Mt. Storm power plant near me because it is a fossil fuel plant. I have at times noticed a smell from Mt. Storm, and I have seen

the stacks there for years. I have seen the coal from the mine down the road heading towards Mt. Storm. I can see what is coming out of the smokestacks, and I can see that it comes out 24 hours a day, 7 days a week. I'm a homeowner with solar panels, so I know that there is technology out there that works better than fossil fuel burning. I know we need to transition from burning fossil fuels, and I know that the technology to transition is available, we just need to make the transition. I think that Mt. Storm should do everything it can to limit its toxic air pollution so that it emits very small amounts of pollution - such small amounts of pollution that the environment can dilute it. We need to train ourselves to not add to the toxic burden in our environment, and we should work towards being "net neutral."

8. I am aware that the U.S. EPA finalized new, stronger standards to reduce toxic soot pollution and mercury pollution from power plants in 2024. Some facilities, including Mt. Storm received an exemption from complying with these standards in 2025. I want power plants to do everything they can to meet toxic air pollution standards sooner rather than later, and in particular because of our environmental crisis. Allowing standards to not be met impacts the very near future just as much as it impacts the present. We have answers to this environmental dilemma that are better answers than deregulation. I fully support

NRDC's lawsuit challenging these exemptions from standards for toxic air pollution from power plants.

I declare that the foregoing is true and correct to the best of my knowledge, information, and belief. Executed on May 21, 2025.

Name: Catherine Fleischman

EXHIBIT 6

Declaration of Barbara Sue

DECLARATION OF BARBARA SUE

I, Barbara Sue, hereby declare as follows:

1. I am currently a member of the Natural Resources Defense Council ("NRDC") and have been for about one year.

2. I live in Macon, Georgia. I have lived at my current residence since 2003, and I moved back to Georgia in 2001.

3. I limit the amount of time I spend outside because I have such severe allergies. I used to like to walk outside a lot, but now I do much of my exercises indoors. I limit my time outside to yardwork, watering my plants, cleaning out the bird baths, and tending to the plants on the porch.

4. I have very severe ongoing allergies – they are not just limited to spring and summer, they last throughout the year, and they get worse and worse every year. I have sinus problems for which I take a number of medications, and I get frequent sinus infections which cause me to need antibiotics. I also now have fluid in my ears that I think the allergies have contributed to as well. My husband also has allergies, but he does not have them as bad as me. My adult daughter, who lives nearby, also gets severe allergies and migraines, like me. I was prescribed albuterol by my doctor since I was coughing at night and occasionally experiencing chest tightness. I thought my allergies were just attributable to pollen, but I am now concerned that they are exacerbated by air pollution.

5. I sometimes keep track of the air quality on my smartphone or watch, but since I try to limit my time outside, I do not keep track of it regularly. I have an air purifier in my bedroom to help with my allergies.

6. Ever since I moved back to Georgia, my allergies have gotten worse. I am concerned about the impact that climate change is having on our environment, and that those impacts are also contributing to my allergies. For example, because of climate change, the plants are blooming earlier and earlier and releasing their pollen earlier than usual. I live near the Scherer power plant, and I'm concerned that air pollution plays a role in my allergies as well.

7. I believe we should do everything in our power to make sure that the air and water is not uninhabitable for animals and for biodiversity – we need everything on the planet to help clean the planet, and everything is interconnected. We are animals too, and we need to be good stewards of the planet. The current administration at EPA is trying to repeal regulations, and rolling back these regulations will set us back one hundred years.

8. I am very concerned that Georgia Power has gotten a two-year extension for their power plants. I want power plants to do everything that they can to clean up their toxic pollution – we are caretakers of the world, and we need to do better. God did not make us caretakers of the animals and the earth so we could be supreme over them, it's our responsibility to care for them. Now that we know

how to take care of the earth, we can and should right all the wrongs we did to the planet unintentionally. Now that we know better, we should do better, and shame on us for not doing that.

9. I am aware that the U.S. EPA finalized new, stronger standards to reduce toxic soot pollution and mercury pollution from power plants in 2024. Some facilities, including Scherer, received an exemption from complying with these standards in 2025. I want power plants to do everything they can to meet toxic air pollution standards as soon as possible, and I do not think deregulation is the answer. I fully support NRDC's lawsuit challenging these exemptions from standards for toxic air pollution from power plants.

I declare that the foregoing is true and correct to the best of my knowledge, information, and belief. Executed on May 28, 2025.

CERTIFICATE OF COMPLIANCE WITH RULES 18(A)(1) AND (A)(2)

The undersigned certifies that this motion complies with Fed. R. App. P. and D.C. Cir. R. 18(a)(1). On May 14, 2024, Petitioners submitted to EPA a Request for Administrative Stay Pending Judicial Review of the *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, published in the Federal Register at 89 Fed.Reg. 38508 (May 7, 2024). EPA acknowledged receipt of this request on May 21, 2024, but has not otherwise responded.

In accordance with Fed. R. App. P. and D.C. Cir. R. 18(a)(2), counsel for Petitioners notified EPA's counsel by voicemail and email on June 3, 2024, that Petitioners planned to file this motion. EPA opposes this motion.

GLOSSARY OF KEY ABBREVIATIONS AND ACRONYMS

Abbreviation Or Acronym	Defined
CAA	Clean Air Act
EGU	Electric Utility Steam Generating Units
EPA	Environmental Protection Agency
fPM	Filterable Particulate Matter
HAP	Hazardous Air Pollutant
Hg	Mercury
MATS	Mercury and Air Toxics Standards
RIA	Regulatory Impact Analysis

INTRODUCTION

With this Rule, EPA is ratcheting down the Mercury and Air Toxics Standards (MATS) for coal-fired power plants by 66-70%. The implementation costs will be substantial, power plants may be forced onto early retirement tracks, and power grid reliability will be threatened. Conversely, there is no relevant public health benefit from the mandated reduction in hazardous air pollutant (HAP) emissions. None. EPA recognizes that the 2012 MATS rule already reduced HAP emissions **well below** any threshold that would impact public health.

Petitioners will establish multiple legal infirmities on the merits requiring the Rule be set aside. But that victory will be meaningless absent a stay, because to comply with the Rule's three-year deadline for implementing the mandated changes (or retiring if they cannot), power plants need to take action immediately. EPA knows this. The last time the MATS Rule was litigated, the Supreme Court held EPA acted "unreasonably when it deemed cost irrelevant to the decision to regulate power plants." *Michigan v. EPA*, 576 U.S. 743, 760 (2015). But the victory proved hollow, because without a stay while the merits were heard, power plants were forced to make compliance and retirement decisions, resulting in billions expended and many plant closures in response to an unlawful regulation. The last time the MATS Rule was litigated is a textbook example for when agency rules should be

stayed. *E.g.*, Ronald Cass, *Staying Agency Rules: Constitutional Structure and Rule of Law in the Administrative State*, 69 Admin. L. Rev. 225, 254-57 (2017).

While EPA claims this Rule will have no impact on the power grid or energy prices, Petitioners have included with this motion an array of declarations from power plants and State regulators attesting that is not the case. And EPA has an established record of grossly understating the effect its rules will have on the power grid. The last time the MATS Rule was litigated, EPA assured the country that it would only cause about 5,000 MW to go offline. EPA was wrong. The number ended up being closer to 60,000 MW. Our power grids do not have the same buffer of dispatchable energy that they did a decade ago. If EPA is wrong to the same degree that it was last time, the impact to our power grids will be substantial.

Petitioners ask the Court to preserve the status quo by staying the Final Rule until the merits of this dispute are resolved. An expedited briefing schedule will limit the duration of any such stay.

BACKGROUND

Section 112 of the Clean Air Act (CAA) (codified at 42 U.S.C. § 7412) provides EPA statutory authority to set emission levels for certain HAPs enumerated in Section 112(b)(1). *Sierra Club v. EPA*, 895 F.3d 1, 7 (D.C. Cir. 2018). As EPA acknowledges, "Congress intended for CAA Section 112 to achieve significant reductions in HAP." 89 Fed.Reg. at 38535.

EPA issued the original MATS rule for HAP emissions from coal- and oil-fired electric generating units (EGUs) in 2012. 77 Fed.Reg. 9304 (Feb. 16, 2012). That rule identified different achievable control standards for mercury from EGUs that use lignite coal compared to other types of coal. The distinction was based on science: lignite is more variable than other types of coal and available technologies cannot consistently achieve the same control levels. 77 Fed.Reg. at 9393.

Eight years after a HAP emission level is set, EPA must evaluate if any "residual risks" remain to public health from those HAP emissions and whether there have been any developments in available control technologies. 42 U.S.C. §§7412(f)(2), (d)(6). EPA calls these the Residual Risk and Technology Reviews.

In 2020, EPA conducted those reviews for the MATS Rule. For the Residual Risk Review, EPA "determined that the current [standard] provides an ample margin of safety to protect public health and prevent an adverse environmental effect." 85 Fed.Reg. 31286, 31314 (May 22, 2020). And for the Technology Review, EPA determined there were no developments in emission control technologies, practices, or processes that warranted revising the MATS Rule. *Id.* at 31298.

But six months later there was a change in presidential Administration and Executive Order 13990, entitled "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis," which directed EPA to consider "suspending, revising, or rescinding" the 2020 Residual Risk and Technology

Reviews for the MATS Rule. 86 Fed.Reg. 7037 (Jan. 25, 2021). That was so despite the fact that EPA's authority for promulgating the MATS Rule under CAA Section 112 has nothing to do with climate change—it is about protecting the public from specified HAPs, not greenhouse gases.

Following Executive Order 13990, EPA reconsidered its 2020 Residual Risk and Technology Reviews for the MATS Rule. For public health, EPA reached the same conclusion. 88 Fed.Reg. 24854, 24895 (Apr. 24, 2023) ("the residual risk assessment showed all modeled exposures to HAP to be below thresholds for public health concern."). That should have been the end of it. In other Section 112(d)(6) rulemakings, EPA has taken the position that if its standards already "provide an ample margin of safety to protect public health and prevent adverse environmental effects, one can reasonably question whether further reviews of technological capability are 'necessary.'" 69 Fed.Reg. 48338, 48351 (Aug. 9, 2004); *see also* 71 Fed.Reg. 76603, 76608 (Dec. 21, 2006). But EPA pressed on.

For its technology re-review, EPA again found "no new practices, processes, or control technologies" for the relevant HAP emissions. 88 Fed.Reg. at 24868. The control technologies used in 2012 are the same as today. *See* 2023 Technology Review for the Coal- and Oil-Fired EGU Source Category ("2023 Tech Review") at 1; 2024 Update to the 2023 Proposed Technology Review for the Coal- and Oil-

Fired EGU Source Category ("2024 Tech Update") at 17, 50.[1] Undeterred, to justify revising the standards, EPA points to alleged cost efficiencies for using those technologies, concluding those alleged efficiencies mean that all coal-fired plants, regardless of configuration or coal type, can now meet a 66% lower surrogate fPM emission standard for non-mercury HAPs. 89 Fed.Reg. at 38530.[2] For mercury, EPA concludes lignite is now capable of meeting the same control standard as other types of coal, dropping the emission standard by 70%. 89 Fed.Reg. at 38586. Coal-fired power plants must meet the new standards in three years or be on a retirement track. 89 Fed.Reg. at 38519.

ARGUMENT

The Court should stay the Rule while the merits are resolved because Petitioners are likely to prevail on the merits of their claims, Petitioners will suffer irreparable harm in the absence of a stay, and the balance of harms and public interest favor a stay. D.C. Cir. R. 18(a)(1).

[1] For non-mercury HAPs, the control technology remains electrostatic precipitators and fabric filters, and for mercury the control technology remains activated carbon injection. 2023 Tech Review at 16–18; 2024 Tech Update at 30–32.

[2] The Final Rule uses filterable particulate matter (fPM) as a surrogate for measuring the non-Hg metal HAP emissions. 89 Fed.Reg. at 38508.

I. Petitioners Are Likely to Prevail on the Merits

A. The Rule Violates Clean Air Act Section 112(d)(6) Because Revising the MATS Standard Is Not "Necessary"

EPA issued this Rule under CAA Section 112(d)(6), which permits revising HAP emission standards only as "necessary (taking into account developments in practices, processes, and control technologies)." 42 U.S.C. § 7412(d)(6). The operative phrase is "revise as necessary," and "EPA must consider practical and technological advances" when determining whether revision is "necessary." *La. Envtl. Action Network v. EPA*, 955 F.3d 1088, 1097-98 (D.C. Cir. 2020).

The Rule's revisions are not "necessary" for several reasons.[3] For one, there is no relevant public health benefit. EPA acknowledges current HAP emission standards provide an ample margin of safety to protect public health and does not identify *any* quantifiable health benefit from the Rule's further reduction in HAPs. 89 Fed.Reg. at 38558-59. The alleged health "benefits" EPA purports to quantify—reducing criteria pollutants and greenhouse gases, *id.* at 38561-62—cannot serve as a basis for exercising Section 112(d)(6) authority.

Absent any relevant public health benefits from the Rule, EPA claims the revisions are "necessary" due to "developments" in controlling HAP emissions. *Id.* at 38518. But even if a "development" in control technologies could make revising

[3] Black's Law Dictionary (11th ed. 2019) (*Necessary*: "needed for some purpose or reason; essential.").

a HAP emission standard that provides no relevant health benefits "necessary" under Section 112(d)(6), EPA identified no new technologies, practices, or processes that would justify revising the MATS Rule. 42 U.S.C. § 7412(d)(6). The primary control technologies used today are the same as they were the last two times EPA undertook a technology review. 89 Fed.Reg. at 38517-18.

Rather than pointing to any new technology, EPA interprets "development" to mean cost-efficient compliance with already-existent technology. *Id.* at 38510. That interpretation of "development" is an atextual attempt to expand EPA's regulatory reach. *Cf. Nat. Res. Def. Council v. EPA*, 529 F.3d 1077, 1084 (D.C. Cir. 2008) (Section 112(d)(6) rulemaking revises "*technology-based* standards in light of *technological* developments" and requires identification of "*technological innovations*") (emphases added).

EGUs are *required* to comply with HAP emission standards after they are issued, and they must comply with a margin that accounts for fuel variability to consistently meet the emission standard 100% of the time. EPA's interpretation of such compliance as a "development" warranting further rulemaking constitutes a significant power grab—ignoring Section 112(d)(6)'s constraint to only revise the standards as "necessary," and empowering EPA to drive any disfavored source out of the market by tightening HAP emission limits until an emission source with a variable fuel supply is unable to comply *at all times*.

B. The Rule is Arbitrary and Capricious for Multiple Reasons

A rule is arbitrary and capricious "if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem…or is so implausible that it could not be ascribed to a difference in view of the product of agency expertise." *Motor Vehicle Mfrs. Ass'n v. State Farm*, 463 U.S. 29, 43 (1983). This Rule is arbitrary and capricious for many reasons, each of which warrants vacating it.

First, EPA's cost-benefit analysis is indefensible. Section 112(d)(6) rulemaking requires reasonable consideration of cost. *See Ass'n of Battery Recyclers v. EPA*, 716 F.3d 667, 673-74 (D.C. Cir. 2013) (rejecting argument cost is irrelevant to emission standard revisions under Section 112(d)(6)). Yet EPA candidly admits the Rule has a "negative net monetized benefit." 89 Fed.Reg. at 38511. Under the standards already in place, EPA found the lifetime cancer risk of the person most exposed to coal-fired HAP emissions is 0.344-in-a-million—significantly less than the Clean Air Act's one-in-a-million threshold where EPA can stop regulating a source entirely. 42 U.S.C. § 7412(c)(9)(B)(i); *see also Nat. Res. Def. Council*, 529 F.3d at 1082 (one-in-one million standard is the CAA's "aspirational goal").

Even EPA's qualitative generalizations don't evidence any meaningful health benefits from the mandated reduction in HAPs. EPA admits the benefits of Hg reduction associated with the Rule are so small they can't be reliably extrapolated to

the broader population of fish consumers. RIA 4-5. And where risk to subsistence fishers located near lignite-fired plants has been studied, fisherman are already not exposed at a level associated with appreciable risk—and that is before the further reductions associated with this Rule. RIA 4-4. EPA's analysis of non-Hg HAP emissions is much the same, with EPA acknowledging "cancer risk was … within the acceptable range for multipathway exposure to the persistent and bioaccumulative non-Hg HAP metals." RIA 4-7. Likewise, noncancer risks did not exceed current thresholds for adverse health effects. *Id.*

To the extent EPA identified any quantifiable "benefits" of the Rule, they are *all* ancillary to the Rule's reduction in HAP emissions and cannot drive a Section 112 cost-benefit analysis. *E.g.*, 89 Fed.Reg. at 38561 (pointing to alleged particulate matter, ozone, and "climate" benefits). As Chief Justice Roberts noted during oral argument in *Michigan v. EPA*, it is improper for EPA to use Section 112 authority to "get at the criteria pollutants that you otherwise would have to go through a much more difficult process to regulate. In other words, you can't regulate the criteria pollutants through the HAP program…" Transcript of Oral Argument at 59:19–60:5, *Michigan v. EPA*, 576 U.S. 743 (2015). *Cf. Wyoming v. Dep't of Interior*, 493 F. Supp. 3d 1046, 1079 (D. Wyo. 2020) (agency "cannot rationally claim the Rule's objective is waste prevention while justifying its considerable costs almost entirely on climate change benefits").

In exchange for zero relevant public health benefits, the Rule will impose tremendous costs on coal-fired EGUs and electricity consumers. Under EPA's own calculations, the estimated cost-per-ton of HAP removed exponentially exceeds cost-benefit ratios that EPA has rejected for other Section 112 rulemakings. For surrogate fPM emissions, by EPA's own math, the cost effectiveness is $10.5 million per ton of HAP removed. 89 Fed.Reg at 38532-33. That is orders of magnitude higher than cost-benefit ratios EPA has explicitly *rejected* as being excessive. *E.g.*, Westmoreland Mining Holdings Cmt. at 4, EPA-HQ-OAR-2018-0794-5935 (compiling examples). EPA admits as much. 89 Fed.Reg. at 38523 ("EPA acknowledges that the cost-effectiveness values for these standards are higher than cost-effectiveness values that the EPA concluded were not cost-effective…for some prior rules.") 89 Fed.Reg. at 38523. These costs will likely force power plant retirements and threaten grid reliability, *see infra*, but, even if they didn't, they will increase the price of electricity for consumers. Just as it is arbitrary and capricious for EPA to impose significant economic costs "for a few dollars" of benefit, *Michigan*, 576 U.S. at 752, so too where EPA imposes substantial costs with "no meaningful benefit." *Mexican Gulf Fishing Co. v. U.S. Dep't of Comm.*, 60 F.4th 956, 966 (5th Cir. 2023).

Second, even assuming cost-efficient compliance using existing technology can lawfully be considered a "development" in practices, processes or control

technologies warranting further restrictions under Section 112(d)(6), EPA has not provided a reasoned explanation to support its conclusion that coal-fired EGUs are capable of consistently meeting the Rule's new emission standards with available control technologies. Comment after comment put EPA on notice that the Rule's conclusions regarding compliance feasibility were flawed.[4] But to support its contrary conclusion, the Final Rule relies almost entirely on a single comment (the "Andover Report") that largely parrots EPA's conclusions from the proposed rule without sufficient factual basis or explanation and is woefully inadequate to support EPA's conclusions. *E.g.,* 89 Fed.Reg. at 38523, 38528, 38530, 38538.

Third, EPA failed to adequately consider the Rule's foreseeable impact on our nation's already-precarious power grids. Where, as here, EPA promulgates a Rule under Section 112(d) that will foreseeably impact grid reliability, it must thoroughly address the concern. *Del. Dep't of Nat. Res. & Envtl. Control v. EPA*, 785 F.3d 1, 18 (D.C. Cir. 2015) ("'Costs' can mean many different things, including the cost associated with increased risk" of grid unreliability).

EPA's perfunctory conclusion that the significant costs the Rule imposes on coal-fired EGUs will have no effect on the power sector, 89 Fed.Reg. at 38555-56,

[4] *E.g.,* Lignite Energy Council Cmt. at 8-9, EPA-HQ-OAR-2018-0794-5957; Nat'l Mining Ass'n Cmt. at 10-15, EPA-HQ-OAR-2018-0794-5986; Westmoreland Mining Holdings Cmt. at 16-17 (proposed fPM standard is not achievable or feasible); Coal Conversion Counties Ass'n Cmt. at 8, EPA-HQ-OAR-2018-0794-6003 (proposed mercury standard is not achievable or feasible).

does not reflect reasoned analysis entitled to any degree of deference. "EPA has no expertise on grid reliability," *Texas v. EPA*, 829 F.3d 405, 432 (5th Cir. 2016), and comment after comment put EPA on notice that the Rule will foreseeably have significant impacts on power grid reliability.[5] Nonetheless, the Final Rule does not reflect any attempt by EPA to seek input from the Federal Energy Regulatory Commission (FERC), the North American Electric Reliability Corporation (NERC), or any similar entity that could have apprised it of the Rule's likely impact on grid reliability. EPA also failed to address power outages or grid reliability in its Regulatory Impact Analysis. *See* RIA Section 3. EPA's failure to adequately consider one of the Rule's most important impacts was arbitrary and capricious. *State Farm*, 463 U.S. at 43; *see also Del. Dep't of Nat. Res.*, 785 F.3d at 18 (encouraging EPA to solicit input from FERC).

Moreover, as noted *supra*, the last time the MATS Rule was litigated, EPA claimed it would only cause about 5,000 MW to go offline. 77 Fed.Reg. at 9407 ("...expected retirements of coal-fueled units as a result of this final rule (4.7 GW) are fewer than was estimated at proposal and much fewer than some have

[5] *E.g.*, Rainbow Energy Center Cmt. at 4, EPA-HQ-OAR-2018-0794-5990; *see also id.*, Attachment A at 3-4 (MISO Cmt. on Docket ID Nos. EPA-HQ-OLEM-2021-0283, EPA-HQ-OLEM-2021-0282, EPA-HQ-OLEM-2021-0280); Minnkota Power Coop. Inc. Cmt. at 3, EPA-HQ-OAR-2018-0794-5978; Power Generators Air Coalition Cmt. at 12, EPA-HQ-OAR-2018-0794-5994.

predicted"). EPA was wrong. It ended up being closer to 60,000 MW.[6] That dramatic difference represents a profound failure on EPA's part to analyze the rule's impacts on power generation. Consequently, EPA's perfunctory conclusion that this Rule (dropping emission standards by 66-70%) will not cause a single retirement, RIA at 3-16, should be viewed with extreme skepticism given the number of comments and declarations attesting EPA has gotten it profoundly wrong again.

EPA's analysis of the Rule's grid impacts also fails to "acknowledge and account for" the impacts of "contemporaneous and closely related rule[s]." *Portland Cement Ass'n v. EPA*, 665 F.3d 177, 187 (D.C. Cir. 2011). EPA expressly issued this Rule as part of a "suite" of rules targeting coal power plants with retirement-inducing costs. *See* EPA, *Biden-Harris Administration Finalizes Suite of Standards to Reduce Pollution from Fossil Fuel-Fired Power Plants* (Apr. 25, 2024).[7] EPA's

---

[6] *See, e.g.*, U.S. Energy Info. Admin., *Planned coal-fired power plant retirements continue to increase* (Mar. 20, 2014), bit.ly/4dbYwfM (between 2012 and 2020, "about 60 gigawatts of coal-fired capacity is projected to retire … assum[ing] implementation of the MATS standards"); Pratson et. al., *Fuel Prices, Emission Standards, and Generation Costs for Coal v Natural Gas Power Plants*, Am. Chem. Soc'y, Env'l Sci. & Tech., 4929 (Mar. 2013), bit.ly/3w7yLN2 (most coal-fired EGU retirements in the wake of the original MATS Rule were due to "stronger regulations," not unrelated market forces); *see also* Nat'l Min. Ass'n Cmt. at 2 & n.4, EPA-HQ-OAR-2009-0234-20531 (for the nearly 60 gigawatts of coal-fired EGU retirements announced between 2012 and 2016, "virtually all" stated the closures were "either fully or partially attributable to MATS and other EPA regulations").

[7] Available at https://tinyurl.com/y5u92sx3.

failure to meaningfully assess how the confluence of these (and many other) rules targeting coal-fired power plants will affect the power grid further cements its arbitrary and capriciousness.

Fourth, the Rule is arbitrary and capricious because EPA's stated reasons for it are pretextual. When an agency promulgates a rule, it must truthfully "disclose the basis of its action," and courts must set aside rulemaking when "the evidence tells a story that does not match the explanation." *Dep't of Commerce v. New York*, 139 S. Ct. 2551, 2575-76 (2019). Despite claiming it engaged in this rulemaking to protect the public from specified HAP emissions, 89 Fed.Reg. at 38509-10, available evidence not least of which is the Executive Order *on climate change* which EPA admits spurred this rulemaking indicates EPA is using its Section 112(d)(6) authority as part of an effort to force a nationwide transition away from coal for putative climate change reasons. *Contra West Virginia v. EPA*, 597 U.S.697, 735 (2022) (declaring it "not plausible" the CAA empowers EPA to "force a nationwide transition away from the use of coal to generate electricity").

Internal documents produced through FOIA indicate EPA and the White House Climate Office contrived revising the MATS Rule as a means of reducing power plant emissions for climate change reasons. For example, in February 2021, EPA prepared a presentation for the White House Climate Advisor. *See* Power Sector Strategy: Climate, Public Health, Environmental Justice, Briefing for Gina

McCarthy and Ali Zaidi (Feb. 4, 2021). Ex.15 (Chang Decl.) ¶¶3-5. While heavily redacted, the document evidences EPA's intent to use its regulatory authority under various programs, including the MATS Rule, for reducing power plant emissions to implement the Administration's climate agenda. *Id.* ¶¶6-7.

Those internal documents match public comments from the EPA Administrator, who repeatedly stated EPA would issue a "suite of rules" designed to close fossil fuel-fired power plants, with the co-benefit of combating climate change. *E.g.*, Geman, *EPA floats path on electricity CO2 emissions with an asterisk*, Axios (Mar. 11, 2022).[8]

As just one example, Administrator Regan said his agency would "couple" climate regulations with "health-based" regulations to regulate greenhouse gases and get around the *West Virginia v. EPA* decision.

> **PBS**: How much of a setback is [the *West Virginia v. EPA* decision] to your efforts to regulate greenhouse gases?
>
> **Regan**: ...We still will be able to regulate climate pollution. And we're going to use all of the tools in our toolbox. ...
>
> **PBS**: Well, can you give us a couple of examples of the kind of tools that you believe you still can use to regulate this industry?
>
> **Regan**: ...We also have a suite of regulations that are facing the power sector. And so, *as we couple the regulation of climate pollution with the regulation of health-based pollution*, we are providing the power

[8] Available at https://www.axios.com/2022/03/11/epa-electricity-co2-emissions.

> sector with a very clear picture of what regulations they're facing so that they can make the right investment decisions.

PBS, *EPA Administrator Michael Regan discusses Supreme Court ruling on climate change*, YouTube (June 30, 2022) (emphasis added);[9] *see also, e.g.*, White House, *Press Gaggle by Principal Deputy Press Secretary Karine Jean-Pierre & Env't Prot. Agency Adm'r Michael Regan* (Feb. 17, 2022) (stating if the Supreme Court limits EPA's ability to regulate greenhouse gas emissions, EPA will respond with "bread-and-butter regulations," such as "regulating mercury").[10]

EPA's public statements and documents evidence this Rule was not promulgated to protect the public from exposure to the regulated HAPs. The purpose for EPA's recent "suite" of rules targeting coal-fired plants is recognized around the world,[11] and courts are "'not required to exhibit a naiveté from which ordinary citizens are free.'" *Dep't of Commerce*, 139 S. Ct. at 2575 (citation omitted).

II. Petitioners Will Suffer Imminent and Irreparable Harm Absent a Stay

A. Petitioner States Will Suffer Irreparable Economic Harm

Petitioner States will suffer irreparable economic harm if the Rule is not stayed during the pendency of litigation.

EPA's claim that the Rule will have almost no impact on electricity prices, 89 Fed.Reg. at 38555-56, does not reflect reasoned decision-making. EPA acknowledges that complying with the Rule will impose millions in costs (presuming plants are able to comply at all). 89 Fed.Reg. at 38561. Those costs must be borne somewhere, and Petitioners have provided declaration after declaration attesting that implementing the Rule will inevitably require prices to increase. Ex.2 (Fedorchak Decl.) ¶¶25-33; Ex.3 (Lane Decl.) ¶23; Ex.7 (Huston Decl.) ¶¶16-17; Ex.8 (Bohrer Decl.) ¶¶18-21; Ex.9 (McLennan Decl.) ¶43; Ex.10 (Tschider Decl.) ¶29; Ex.11 (McCollam Decl.) ¶¶33-35; Ex.16 (Purvis Decl.) ¶11. Any increase in retail electric rates will impose unrecoverable costs on Petitioner States and their residents, including the States as consumers of electricity. *E.g.*, *California v. Azar*, 911 F.3d 558, 581 (9th Cir. 2018) (economic injury sustained by states due federal agency action "is irreparable … because the states will not be able to recover monetary damages").

Moreover, absent a stay of the Final Rule during the pendency of litigation, State regulators will need to expend substantial resources overseeing

implementation of the Final Rule and attempting to mitigate its deleterious effects. Ex.2 (Fedorchak Decl.) ¶7; Ex.3 (Lane Decl.) ¶¶29-31.

B. The Rule's Compliance Costs and Infeasible Standards Risk Catastrophic Consequences for the Power Grid

Even more concerning than the imposition of unrecoverable economic costs, the Rule also threatens irreparable harm by undermining power grid reliability, as power outages are frequently paid for with human lives. *E.g.*, FERC-NERC-Regional Entity Staff Report: The February 2021 Cold Weather Outages in Texas and the South Central United States (Nov. 16, 2021) (over 200 fatalities during weather event "with most of the deaths connected to the power outages").

Although the Rule includes a three-year implementation period, absent a stay during the pendency of litigation, complying with that deadline (or commencing retirement plans if they cannot) requires EGUs to make decisions and take requisite actions *now*. Power plants cannot start and stop instantaneously; actions taken now will be irreversible and will affect power grids for years to come. Ex.8 (Bohrer Decl.) ¶¶24-28; Ex.9 (McLennan Decl.) ¶58; Ex.10 (Tschider Decl.) ¶¶25-30; Ex.11 (McCollam Decl.) ¶¶34-43; Ex.12 (Friez Decl.) ¶¶16-17; Ex.16 (Purvis Decl.) ¶¶15-19. As discussed *supra*, that is precisely what happened the last time the MATS Rule was litigated. Even though the Supreme Court ultimately held EPA acted unreasonably in promulgating the last MATS rule, *Michigan*, 576 U.S. at 743,

regulated EGUs had already been required to spend billions in compliance costs (or begin shutdown operations).

Power plants are again saying this Rule will result in substantial costs and may result in plant closures. Ex.8 (Bohrer Decl.) ¶¶21-24; Ex.9 (McLennan Decl.) ¶¶34-39, 70 ("Recent test data suggest that Minnkota will not be able to meet the New Mercury Limitation even at the higher PAC injection rates that EPA assumed to be sufficient to meet the New Mercury Limitation."); Ex.10 (Tschider Decl.) ¶¶21-23; Ex.11 (McCollam Decl.) ¶¶34-43; Ex.16 (Purvis Decl.) ¶¶24-25 (upgrades to comply "will certainly fail, despite best engineering and maintenance practices, due to the lack of any margin to meet the aggressively low new fPM limitation"). That injury will be irreparable. *Texas v. EPA*, 829 F.3d at 434 (potential closures threatened "the very existence of some of Petitioner's businesses and, even assuming, *arguendo*, that the plant operators could recover their costs from…their consumers, this would not be a recovery made in the course of the litigation").

EPA's perfunctory conclusion this Rule will not affect the power grid at all, 89 Fed.Reg. at 38519, should not be trusted. "EPA has no expertise on grid reliability." *Texas v. EPA,* 829 F.3d at 433. That expertise resides in FERC and NERC, yet EPA did not consult either before finalizing the Rule. Nor does EPA's Regulatory Impact Analysis reflect a long-term assessment of grid reliability, despite receiving comment after comment that the Rule would have significant impacts on

the power grid. *See* RIA at 3-23 3-24. And EPA's feasibility determinations are supported almost entirely by a single comment that is woefully inadequate to support EPA's conclusions. *See* Ex.13 (Holmes Decl.) ¶11 (summarizing EPA's reliance on the Andover Report as "bootstrapping at its worst").[12] State and grid regulators attest the foreseeable impacts of this Rule on power grid reliability will be significant. Ex.1 (Vigesaa Decl.) ¶¶11-26; Ex.2 (Fedorchak Decl.) ¶¶7-24; Ex.3 (Lane Decl.) ¶¶18-34; Ex.4 (Rickerson Decl.) ¶¶13-15; Ex.5 (Nowakowski Decl.) ¶¶7-12; Ex.6 (Webb Decl.) ¶¶6-10; Ex.7 (Huston Decl.) ¶12.

In a telling section, EPA dismisses widespread concerns about the Rule's foreseeable impact on power grid reliability by assuming that State or regional regulators will be able to use emergency powers to prop up the power grid if the Final Rule makes EGUs no longer commercially viable. 89 Fed.Reg. at 38526. EPA's reliance on such emergency, stopgap powers to prevent the Rule from breaking the power grids is the epitome of arbitrary and capricious agency action.

According to a study commissioned by the North Dakota Transmission Authority, if the Rule causes any of North Dakota's lignite-fired EGUs to retire, it will risk causing the entire MISO grid to experience black-outs resulting in economic damages ranging from $29 million to over $1 billion. Ex.1 (Vigesaa Decl.) ¶¶22-

[12] Further, an author of one of the few other studies EPA relies upon for its feasibility determination attests EPA is also misusing that study. Ex.14 (Benson Decl.) ¶¶6-8.

25. Given that the Rule will likely have the effect if not the deliberate goal of setting HAP emission standards that coal-fired EGUs in North Dakota and elsewhere will be unable to comply with, undermining long-term grid reliability is a foreseeable impact of the Rule that EPA failed to take seriously.

Furthermore, as noted *supra*, EPA's conclusion the Rule will have no impact on power plant operations should be viewed with skepticism given EPA's history of woefully underestimating the impact that its rules—and the MATS Rule specifically—will have on power plant operations. The last time EPA promulgated the MATS Rule, its claim that it would impact only about 5,000 MW of power ended up being wrong by over a factor of ten. The power grids today do not have the same buffer of dispatchable power that they had a decade ago, and an error on the same magnitude as EPA's last profound error would likely have catastrophic results. Ex.1 (Vigesaa Decl.) ¶11-12; Ex.3 (Lane Decl.) ¶¶12-13; Ex.7 (Huston Decl.) ¶¶8-14.

In similar circumstances, the Fifth Circuit stayed an EPA rule that a state plausibly alleged would result in grid instability due to the likely closure of coal-fired power plants during the pendency of litigation. *Texas v. EPA*, 829 F.3d at 434. In that case, Texas argued that the changes mandated by the challenged rule would cost power plants upwards of "$2 billion, rendering them uneconomical and forcing the plants to close" potentially "remov[ing] 3,000 MW to 8,400 MW of generating

capacity." *Id.* at 416. Consequently, the court held that "the threat of grid instability and potential brownouts alone constitute irreparable injury." *Id.*

III. The Balance of Harms and the Public Interest Favor a Stay

Staying the Rule while Petitioners' challenge is heard on the merits will maintain the status quo, and EPA acknowledges the status quo already protects public health. 89 Fed.Reg. at 38508 (existing standards already provide an "ample margin of safety").

The public interest also favors a stay when that rule would potentially threaten the public's access to affordable electricity. *Texas v. EPA*, 829 F.3d at 435 (granting stay where "public interest in ready access to affordable electricity" outweighed "inconsequential" emissions reductions that rule implementation would have achieved during the pendency of the litigation); *see also, e.g., Sierra Club v. Ga. Power Co.*, 180 F.3d 1309, 1311 (11th Cir. 1999) (denying preliminary injunction where it threatened to reduce power generation, as "[a] steady supply of electricity ... especially ... [for] the elderly, hospitals and day care centers, is critical."); *West Virginia v. EPA*, 90 F.4th 323, 332 (4th Cir. 2024) ("the public [] has an interest in the efficient production of electricity and other industrial activity in the State, even as such production is balanced with environmental needs").

And courts have found "unconvincing" the suggestion that the public will be injured from a stay pending litigation where, as here, complying with the rule "would

not reduce emissions for at least three years." *Texas v. EPA*, 829 F.3d at 434. That is particularly the case where, as here, the existing conditions already far exceed federal safety or environmental goals. *Id.* at 434–35.

CONCLUSION

Petitioners ask the Court to stay implementation of the Final Rule.

Respectfully submitted,

DREW H. WRIGLEY
Attorney General

Solicitor General of North Dakota

EXHIBIT 8

Declaration of Penny E. Lassiter

***Blue Ridge Environmental Defense League v. Regan*,**
No. 22-03134 (D.D.C.)

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

BLUE RIDGE ENVIRONMENTAL DEFENSE LEAGUE, *et al.*,	)	
Plaintiffs,	)	
v.	)	Case No. 1:22-cv-03134
MICHAEL S. REGAN, in his official capacity as Administrator of the U.S. Environmental Protection Agency,	)	Hon. Amit P. Mehta
Defendant.	)	

DECLARATION OF PENNY E. LASSITER

1. I, Penny E. Lassiter, under penalty of perjury, affirm and declare that the following statements are true and correct to the best of my knowledge and belief and are based on my personal knowledge or on information contained in the records of the United States Environmental Protection Agency ("EPA") or supplied to me by EPA employees under my supervision.

2. I am the Director of the Sector Policies and Programs Division ("SPPD") within the Office of Air Quality Planning and Standards ("OAQPS"), Office of Air and Radiation ("OAR") at EPA. I have held this position in a permanent capacity since May 26, 2019. SPPD is the division within OAQPS that has responsibility for developing, reviewing, and revising, as required and appropriate, regulations under section 112 of the Clean Air Act ("CAA"), 42 U.S.C. § 7412, the National

Emission Standards for Hazardous Air Pollutants ("NESHAP") program, including regulations relevant to hazardous waste combustion.

3. As Director of SPPD, I am responsible for overseeing EPA's promulgation of regulations under the NESHAP and other CAA programs. From my longstanding experience, including 26 years of leadership in SPPD and its predecessor division with similar regulatory development responsibilities, I am very familiar with the processes required in developing and promulgating major EPA regulations under the CAA and the time periods allotted for EPA to take regulatory actions thereunder, including issuing rules pursuant to CAA sections 112(f)(2)(A) and 112(d)(6), 42 U.S.C. §§ 7412(f)(2)(A) and 7412(d)(6), respectively. I have also relied upon my staff to provide the factual information concerning the regulatory steps and schedule needed for the particular CAA section 112, 42 U.S.C. § 7412, actions at issue in the case for which I make this declaration.

4. At this time, the earliest possible completion date for a final rule making for the National Emission Standards for Hazardous Air Pollutants from Hazardous Waste Combustors (HWC NESHAP) is August 14, 2026. The dates for the rule making phases described in my July 27, 2023, declaration are updated as follows to reflect events since that time; asterisks indicate where time was removed from the phase in comparison to the July 27, 2023, declaration and why:

Phases from July 27, 2023 Declaration	Completion or Estimated Completion Date
Phase I. Project Kickoff	Completed June 2023
Phase II. Preliminary Information Collection	Completed July 2023
Phase III. Supplemental Information Collection and Outreach to Stakeholders	November 22, 2024 (1 month)
Phase IV. Data Analyses and Modeling File Development	December 30, 2024 (1 month)
Phase V. Residual Risk Analysis and Technology Review	April 29, 2025 (4 months)
Phase VI. Development and Completion of Proposed Rule	October 24, 2025 (6 months) * Two months of exclusive OMB time removed
Phase VII. Proposed Rule Publication and Comment Period	January 22, 2026 (3 months)
Phase VIII. Summarization of Comments, Development of Comment Responses and Analysis of Data	March 23, 2026 (2 months)
Phase IX. Development and Completion of Final Rule	August 14, 2026 (5 months) * Remaining two months of exclusive OMB time removed

5. Analysis of title V permits during Phase II showed that some hazardous waste combustors have emissions limits for hazardous air pollutants (HAPs) that are not currently regulated in the HWC NESHAP, including polychlorinated biphenyls (PCBs). Other HAPs or HAP precursors of potential interest at that time

included fluorinated compounds, brominated compounds, polycyclic aromatic hydrocarbons (PAHs), hydrogen cyanide (HCN), and asbestos.

6. My staff therefore issued the "first survey" to nine entities seeking information that was needed to identify the actual additional HAPs or HAP precursors that should be regulated. To expedite the rulemaking process, we chose to survey nine entities that own or operate hazardous waste combustors. Together, these nine entities are representative of the six distinct HWC NESHAP subcategories. If EPA surveys more than nine entities, it must do so through a formal information collection request issued pursuant to the Paperwork Reduction Act. It can take over a year to issue such a request to recipients because it must be developed though public notice and comment and must be approved by the White House's Office of Management and Budget.

7. The first survey was issued on August 17, 2023, and the initial response deadline was October 31, 2023. Due to multiple requests for an extension, we extended the deadline to November 15, 2023. Copies of all responses with confidential business information removed are publicly available at http://www.regulations.gov (Docket ID EPA-HQ-OAR-2004-0022).

8. Based on the responses to the first survey, in Phase III my staff issued the "second survey" of the information collection request, which was an emissions testing request. EPA requested testing of 23 HWCs owned or operated by 9 entities

and targeted four HAPs and one potential HAP surrogate: PCBs, polycyclic aromatic hydrocarbons (PAHs, a class of organic HAPs), hydrogen fluoride (HF), hydrogen cyanide (HCN), and hydrogen bromide (HBr). While HBr itself is not a HAP, it can potentially serve as a surrogate for the release of brominated HAP emissions. Because responses to the first survey indicated that some hazardous waste combustors do not combust the chemical components required to form some of the HAPs, testing requirements in the second survey were tailored to each survey recipient.

9. The initial deadline for providing emission test results in response to the second survey was August 30, 2024. Some companies asked for and were granted deadline extensions for operational reasons (*i.e.*, their combustors were undergoing maintenance and were not operational during the expected testing window). In August 2024, multiple companies contacted EPA and asked for emissions testing extensions due to delays at a third-party laboratory, Eurofins Environment Testing - Knoxville. That laboratory is one of three that, to our knowledge, can process the required samples nationwide. EPA contacted the laboratory, which confirmed a significant delay in sample processing. Because companies had completed their tests in a timely manner but had not yet received their results for reasons beyond their control, EPA extended the emissions testing deadline to September 29, 2024.

In September 2024, because EPA learned that some laboratory results had still not been returned, EPA extended select deadlines until October 31, 2024.

10. On October 30, 2024, one entity requested an extension to November 22, 2024, because they received their final analytical results from the laboratory on October 23, 2024. This data must still undergo review by the facility and appropriate data entry so that the company can use the data to calculate the emission results to respond to the second survey. EPA believes that this timeline is reasonable and granted this request.

11. As of November 1, 2024, EPA has received 19 of 23 emissions testing responses, or 83%, from 7 of 9 entities. We expect to receive results from one of the two remaining entities by November 22, 2024. We do not expect another extension request from this entity because the entity, which is submitting results for three liquid fuel boilers, is no longer waiting on analytical results.

12. EPA has received no test results from the last remaining entity, Norlite, LLC, which suspended operations of their HWCs in March 2024 before testing could be conducted and has not restarted. As described in paragraphs 7 through 9 of my declaration dated September 15, 2023, EPA must obtain emissions testing data in order to develop emissions limits for currently unregulated HAPs. Since Norlite, LLC operates the only hazardous waste burning lightweight aggregate

kilns in the country (one of the six distinct HWC NESHAP subcategories), we will move forward with the RTR rulemaking process with the currently regulated HAPs for lightweight aggregate kilns and require the emissions testing for this subcategory for the currently unregulated HAPs if and when the facility restarts operations.

13. Because we are missing data from only two of the six distinct HWC NESHAP subcategories (liquid fuel boilers and lightweight aggregate kilns), we are proceeding with the rulemaking process for unregulated HAPs for the other four subcategories in the interim. We are also proceeding with the rulemaking process for regulated HAPs from all six HWC NESHAP subcategories. EPA collected available data for regulated HAPs during Phase II of the rulemaking; the second survey was specific to unregulated HAPs.

14. To the extent possible, EPA already is conducting Phase IV by organizing and analyzing data that we have collected. Most of the information collected in Phase II was in PDF format, which cannot be used directly in calculations. We have been extracting that data into a usable format and expect to complete that process in November 2024, facilitating completion of Phase IV in December 2024.

Executed this 4th day of November 2024.

EXHIBIT 9

Declaration of Panagiotis E. Tsirigotis

***Sierra Club v. Pruitt*, No. 16-02461 (D.D.C.)**

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

BLUE RIDGE ENVIRONMENTAL DEFENSE LEAGUE, *et al.*, *Plaintiffs*, v. SCOTT PRUITT, Administrator, United States Environmental Protection Agency, *Defendant.*	Civil Action 1:16-CV-00364-CRC
CALIFORNIA COMMUNITIES AGAINST TOXICS, *et al.*, *Plaintiffs*, v. SCOTT PRUITT, Administrator, United States Environmental Protection Agency, *Defendant.*	Civil Action 1:15-CV-00512-TSC

CORRECTED DECLARATION OF PANAGIOTIS E. TSIRIGOTIS

1. I, Panagiotis E. Tsirigotis, under penalty of perjury, affirm and declare that the following statements are true and correct to the best of my knowledge and belief and are based on my own personal knowledge or on

information contained in the records of the United States Environmental Protection Agency (EPA) or supplied to me by EPA employees under my supervision.

2. I am the Director of the Sector Policies and Programs Division (SPPD) within the Office of Air Quality Planning and Standards (OAQPS), Office of Air and Radiation (OAR) at EPA, a position I have held since February 6, 2006. SPPD is the division within OAQPS that has responsibility for, among other things, developing regulations, policy, and guidance associated with section 112 of the Clean Air Act (CAA), 42 U.S.C. § 7412, which is the national emission standards for hazardous air pollutants (NESHAP) program.

A. Responses to Questions Raised by the Court

3. At the hearing held on February 2, 2017, Judge Cooper requested a declaration from EPA providing additional information concerning the resources available to SPPD, including: (1) How many employees are part of SPPD; (2) How many employees in SPPD work on the risk and technology reviews (RTRs); (3) What are the other responsibilities of SPPD; (4) On what discretionary projects does SPPD work; and (5) To what extent can SPPD call on other Agency resources to complete RTR actions? Judge Cooper subsequently issued an order requiring EPA to submit such a declaration and giving Plaintiffs an opportunity to respond. This declaration is EPA's response to that order.

ED_021114_00003486-00110

4. SPPD is the division of EPA responsible for coordinating efforts of the multiple divisions and offices within EPA that support the RTR program, and SPPD also is responsible for conducting information collection, performing many of the required technical analyses, and drafting the regulatory package and much of the supporting documentation for RTRs. An SPPD staff member serves as the project lead for all RTRs. As discussed in my earlier declaration, the project lead relies on the technical expertise of other SPPD staff as well as staff from other EPA divisions and offices, as well as contractors, to complete the technical analyses and prepare the regulatory package. Other EPA offices, such as the Office of Research and Development, Office of Policy, and the Office of General Counsel, participate in workgroups for each RTR project. Workgroup members provide expertise including technical (such as risk assessment and monitoring), legal (both defensibility and enforceability), and economics. Overall, the projects require considerable coordination, communication, and technical expertise. SPPD currently has 87 employees, 79 of whom work on RTRs (which are described in detail in my previous declaration) in some capacity. Forty-two of the 79 employees are either project leads or project assistants who conduct the day-to-day project activities involved with conducting the required reviews and developing regulations, as necessary. These same staff also serve as the project leads and assistants for SPPD's other CAA-mandated regulatory work, which altogether

ED_021114_00003486-00111

(including the RTRs) results in a total of about 250 regulations subject to periodic review requirements. In addition to the project leads and assistants, there are 6 managers who report directly to me and manage staff, including the project leads and assistants, on multiple projects required under the CAA, including RTRs, as described in paragraphs 5 through 11 below. There also is a group of 6 policy/program development specialists including a manager who have multiple responsibilities related to RTRs and other regulatory projects, including: reviewing all regulatory packages; providing up-to-date guidance materials to staff; supporting litigation activities including the development of legal briefs; developing schedules and tracking progress; coordinating with other EPA offices; identifying regulatory priorities; and developing and implementing policies regarding technical issues in order to ensure that SPPD's rules are consistent with statutory requirements and internally consistent. SPPD also includes a group of 10 staff, including a manager, responsible for monitoring/recordkeeping and reporting. This group develops monitoring requirements for RTRs and other rules, reviews emissions test reports that are used in RTRs and other rules, and develops electronic systems for submittal of emissions data and other information by entities subject to RTRs and other rules. I also manage 7 additional staff, in my division front office, who provide support with budgeting, planning, training, and oversight of SPPD's regulatory programs. Three staff are communication specialists who are

responsible for preparing briefings and providing technical editing support for RTRs and other work products produced by SPPD. Four staff are administrative support, who provide administrative support for all of the work in SPPD, including editing of regulatory packages, setting up meetings, setting up travel, timekeeping, and word processing. Overall, I estimate that the equivalent of 38 full-time staff work on RTRs. For the remainder of this declaration, I use the term full-time equivalents or FTEs to indicate the estimates of how many staff are dedicated to particular responsibilities. As described in paragraphs 6 through 11, SPPD's responsibilities include many other types of regulations and reviews, and the statutory requirements simply cannot be met given the size of the organization. I note that a typical regulatory project requires up to 3 FTEs within SPPD, along with contractor support, and each of the project leads and assistants typically are assigned to multiple projects.

5. RTRs are a significant part of our current work. These reviews must be conducted for all source categories that are subject to maximum achievable control technology (MACT) standards and all section 129 solid waste incinerator rules. There are approximately 120 categories subject to this requirement. We have completed the RTRs for almost 60 of the categories, and RTRs for about 50 additional categories are overdue or will be due soon.

6. As described in the following paragraphs, SPPD is also primarily responsible for developing and reviewing federal air regulations that apply to stationary sources of air pollution under CAA sections 111, 112, and 129.

7. CAA section 111(b) requires EPA to promulgate standards for certain pollutants. These standards, which apply to new sources, are known as new source performance standards (NSPS). EPA also is required to review and, if appropriate, revise each NSPS every 8 years. There are about 70 NSPS that are subject to this ongoing requirement. These projects typically require a comprehensive review of the source category which includes determining whether substantive changes or improvements to the standards are needed. An estimated 11 staff in SPPD (full-time equivalents) work on the review and revision of NSPS, but significantly more staff would be needed to conduct all of the statutorily required reviews. SPPD continues to prioritize and conduct these reviews as staff and contractor resources allow.

8. Under CAA section 112, EPA is required to identify and list categories of stationary sources that emit any of the 187 hazardous air pollutants (HAP) listed in CAA section 112(b)(1) (or any HAP subsequently added by EPA) and then to develop national emission standards for hazardous air pollutants (NESHAP), for those source categories by specified statutory deadlines. These actions are largely completed, although several NESHAP are still in litigation and

ED_021114_00003486-00114

several others have been vacated or remanded by the court of appeals. An estimated 15 staff in SPPD (full-time equivalents) are working on NESHAP (not including RTRs). The NESHAP that apply to major stationary sources of HAP emissions, along with a subset of NESHAP that apply to smaller area sources of HAP emissions, are referred to as MACT standards, and EPA is required to perform the RTR review for all MACT standards as mentioned in paragraph 5. The other NESHAP, which apply to most of the categories of "area" or non-major sources, are referred to as generally available control standards (GACT) and these standards are subject only to the CAA section 112(d)(6) technology review and not to the CAA section 112(f)(2) risk review, as described in paragraph 9.

9. There are about 60 source categories that are only subject to the CAA section 112(d)(6) technology review requirement. The original rules for these source categories were mostly promulgated between 2007 and 2009. To date, EPA has prioritized conducting the technology reviews for those source categories that are also subject to the residual risk review requirement.

10. SPPD is responsible for developing standards under CAA section 129 for solid waste incinerators. SPPD has already promulgated most of the statutorily required rules, although several are subject to ongoing litigation. SPPD is also responsible for promulgating federal plans associated with the section 129 standards. An estimated 4 staff in SPPD (full-time equivalents) work on aspects of

ED_021114_00003486-00115

the section 129 standards. As noted above, all section 129 rules are subject to the requirement to conduct risk reviews of the technology based standards. These rules are also subject to a technology review requirement although under section 129 such reviews are required at 5 year intervals. The staff resources devoted to the review of the section 129 rules are included in the resources we have identified for the RTRs generally.

11. Other activities performed by SPPD include: (1) Developing existing source performance standards under CAA section 111(d); (2) Reviewing and revising (if necessary) emissions factors used for estimating emissions of volatile organic compounds, carbon monoxide and oxides of nitrogen every 3 years as required under section 130 of the CAA; (3) Responding to petitions to add and remove HAPs from the list in CAA section 112(b) of the CAA and major sources from the list in CAA section 112(c); and (4) Periodically reviewing volatile organic compound rules and Control Techniques Guidelines developed under CAA section 183(e).

12. In addition to reviewing, revising and developing regulations and performing other statutorily prescribed actions as described above, SPPD provides programmatic support for these actions. While these activities are not specifically mandated by the statute, SPPD believes they are necessary to support issuance and implementation of the actions that are prescribed by the statute. These activities

ED_021114_00003486-00116

include providing technical expertise and other support for litigation on the rules developed by SPPD; responding to Freedom of Information Act requests; responding to Congressional inquiries; providing technical expertise and guidance to resolve issues concerning implementation of rules developed by SPPD; optimizing and updating procedures and systems used to develop rules and improved efficiency, including quality assurance tools for large data files, comment summary systems, guidance development, and electronic data submittal systems, such as systems for stationary sources to submit emissions data; performing stakeholder outreach, including webinars, other presentations, hotlines, and face-to-face meetings to communicate the requirements of new regulations; and supporting activities, undertaken by other parts of EPA, to implement the rules written by SPPD. These types of activities are performed by most of the technical staff in SPPD as part of their general duties concerning rules and actions for which they are responsible or part of a team. Overall, an estimated 19 SPPD staff (full-time equivalents) work on these other projects and activities.

13. In addition to the activities described above that are prescribed by the statute or that are related to actions prescribed by the statute, SPPD does perform discretionary actions. Historically, most of SPPD's work involves developing, implementing and reviewing statutorily required regulations. The discretionary items that SPPD generally undertakes include many of the types of activities that

ED_021114_00003486-00117

are expected of high performing organizations that are focused on serving clients. Some examples include:

- Professional development of SPPD staff;
- Attendance at technical conferences;
- Development of databases and information technology systems for enabling transparency and access to information related to our programs.

These types of activities constitute a small percentage of SPPD's work that is difficult to estimate but is not appreciable.

14. Administration priorities also can result in SPPD being tasked with certain additional activities that are not required by statute, including development of regulations. Over the past five years, SPPD has expended significant resources on one such action, the Clean Power Plan. Because the Clean Power Plan was developed under the authority of CAA section 111, the administration tasked SPPD with managing the rulemaking process for the plan, the development of which relied on resources from many offices across the agency. The rule was finalized in 2015 and the staff who worked on that rule have now been assigned to work on other projects as described in paragraphs 5 thru 11 above.

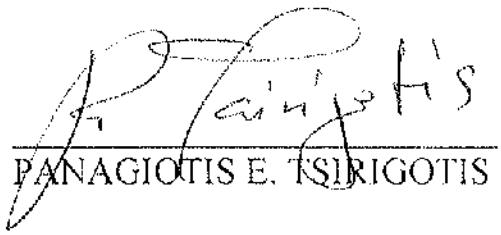
15. In developing RTR actions, SPPD relies on resources in other parts of the agency, as well as contractor resources, to ensure that we engage individuals

ED_021114_00003486-00118

with the needed expertise to resolve the multitude of issues that may arise. As described above and in my earlier declaration, development of an RTR rulemaking requires the involvement of numerous individuals with different skill sets. The schedule provided in my previous declaration to this court includes leveraging available resources from outside of SPPD to assist with various issues and to serve on the project workgroups, which are described in my earlier declaration. Most critically, the Health and Environmental Impacts Division (HEID) within OAQPS also has significant responsibilities related to the RTR projects. The risk assessments described in my earlier declaration are conducted by HEID's Air Toxics Assessment Group, and economic analyses are conducted by HEID's Air Economics Group. Overall, 9 HEID staff work on RTR projects. Of these, about 6 HEID staff (full-time equivalents) scientists and engineers serve as risk assessment leads, and 3 HEID staff (full-time equivalents) serve as lead economists. In recent years, HEID has conducted day-to-day risk and economic project activities for between 8 and 11 RTR source categories per year. This level of support is near HEID's capacity to provide such support. Other workgroup members include staff from: (1) the Office of General Counsel, who provide legal advice and review; (2) the Office of Research Development, who provide additional technical support, evaluate health benchmark information for various pollutants, and help ensure consistency with other Agency actions; (3) the Office of Policy, who evaluate

ED_021114_00003486-00119

consistency across EPA programs and coordinate review with the Office of Management and Budget; (4) the Office of Enforcement and Compliance Assurance, who help to ensure that rules are written in a manner than can be easily understood and implemented; and (5) regional offices who have direct experience with the industrial facilities being regulated. We also make full use of all available contract resources when conducting RTR projects. Contractors provide support in many ways, including conducting technical analyses, drafting technical memoranda explaining those analyses, summarizing comments, and other non-decisional aspects of rulemaking.



16. SPPD leverages resources from other parts of the Agency as explained above; however, the division generally cannot rely on other staff within the Agency or on contractors to perform the tasks currently performed by SPPD staff. As noted, SPPD is a division within the Office of Air Quality and Planning Standards (OAQPS), which is part of the Office of Air and Radiation (OAR). The Office of Air and Radiation is responsible for implementing the CAA. Each of the offices with OAR is responsible for implementing specific CAA programs and many of those programs are subject to statutory deadlines. Even assuming those offices have resources devoted to activities that could be considered discretionary, the staff do not have expertise that would allow them to step into the shoes of the

experts in SPPD with little to no training. The offices outside OAQPS include staff with expertise in significantly different programs, such as mobile sources and stratospheric ozone protection. Even within OAQPS, the other offices typically have significantly different expertise, such as developing national ambient air quality standards (NAAQS) and working with states on developing plans to meet the NAAQS. The staff responsible for RTR rulemaking are doing a specialized job that requires specialized training and experience. An environmental engineering or environmental science background, along with expertise in the industrial sectors being regulated are necessary in order to effectively lead RTR projects. It also is important to note that contractors cannot perform any "inherently governmental" tasks, such as selecting regulatory options and establishing policy, associated with RTR rulemaking. Finally, the time that is needed to conduct the individual tasks cannot be shortened by the addition of more staff or contractor resources in many instances. For example, the length of the public comment period is prescribed by the statute; the time to perform the risk modeling is dependent on technical constraints; and the time to collect data from industry is dependent on limitations of the individual companies, including the time it takes to perform testing, if required.

ED_021114_00003486-00121

17. In summary, due to SPPD's considerable workload, the available staff, and budgetary constraints, SPPD must prioritize work, and it is usually the case that the available resources are insufficient to allow all of the required work to be completed in a timely fashion.

SO DECLARED:

PANAGIOTIS E. TSIRIGOTIS

Dated: 3/1/17

ED_021114_00003486-00122

ORAL ARGUMENT NOT YET SCHEDULED

IN THE UNITED STATES COURT OF APPEALS FOR THE DISTRICT OF COLUMBIA CIRCUIT

AIR ALLIANCE HOUSTON, et al., *Petitioners*, v. UNITED STATES ENVIRONMENTAL PROTECTION AGENCY and LEE ZELDIN, Administrator, U.S. Environmental Protection Agency, *Respondents*.	Case No. 25-1143

PETITIONERS' RESPONSE IN OPPOSITION TO RESPONDENTS' MOTION FOR SIX-MONTH ABEYANCE

In April, President Trump gave nearly one-third of coal-fired power plants across the country a free pass to cease their preparations to meet lower mercury and air toxic emissions standards. EPA updated those standards, known as MATS, just over a year ago. In doing so, EPA recognized that the vast majority of coal-fired power plants were capable of and indeed already limiting their emissions of these dangerous pollutants below what was required in its prior, 2012 standards. Nevertheless, with a stroke of his pen, the President in his April 8, 2025 Proclamation exempted an unspecified list of facilities from their compliance

obligations through July 2029 by summarily asserting, without evidence or even a gesture at source-specific analysis, that "technology to implement" that Rule is "not available." Proclamation 10914 of April 8, 2025, 90 Fed. Reg. 16,777 (Apr. 21, 2025). That Proclamation was followed by EPA's publication of a list of the particular facilities to which the Proclamation would apply, which likewise offered no evidence or logic for those facilities' selection.

The President's assertion that the technology is unavailable is false.[1] And EPA's action to apply that declaration to particular facilities is unlawful. That unlawful action is having effects today. As prospective Respondent-Intervenor Talen Montana, LLC, confirms in its motion to intervene, coal plants have already suspended actions to reduce their emissions to comply with the updated standards. *See* Mot. to Intervene, ECF 2129297 at 6 (asserting that Talen Montana, operator of one of the exempted facilities, "has already made operational planning and compliance decisions in reliance on the Presidential Exemption"). Petitioners are entitled to pursue judicial review and seek judicial relief to minimize and prevent harm to Petitioners, their members, and the public from the unlawful exemptions effectuated by EPA.

[1] EPA admitted as much in its recent proposal to repeal the 2024 MATS Rule, writing that the Colstrip Power Plant in Colstrip, Montana, "was *the only* facility unable to meet the lower [filterable particulate matter] standard with *existing controls*." 90 Fed. Reg. 25,535, 25,541 (June 17, 2025) (emphasis added).

The six-month abeyance Respondents request, ECF 2128844 ("Abeyance Mot."), seeks to deprive Petitioners of that opportunity. While Petitioners have indicated to Respondents that they may be willing to consider abeyance of this petition in the event district court litigation concerning the Exemption Proclamation itself proceeds apace, *see Air Alliance Houston v. Trump*, Case No. 1:25-cv-1852-PLF (filed June 12, 2025), Respondents have not yet filed their responsive pleading in that matter, so it remains unknown which forum will take the lead on these questions. Plus, Respondents are seeking abeyance in that matter as well or, in the alternative, further delay of their answer deadline. *Id.*, ECF No. 26. A six-month abeyance of this petition before any indication that Petitioners will be able to vindicate their rights in the district court litigation would be patently premature.

Forcing this case into abeyance now, without a confirmed alternative forum, would thus impose substantial hardship on Petitioners and their members by depriving them of the emissions reductions that would flow from timely judicial review and timely industry compliance with the standards. Petitioners' and the public's interests in promptly achieving the health protections afforded by the updated MATS rule far outweigh the modest burden on Respondents to defend their actions. The *potential* future repeal of parts of that rule—which EPA proposes to accomplish through a separate action under separate statutory

authority does not moot and should not delay review of the unlawful action EPA has already taken. The Court should deny Respondents' abeyance request.

BACKGROUND

Coal plants are one of the largest domestic emitters of hazardous air pollutants like mercury, arsenic, nickel, and other toxic metals. *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, 89 Fed. Reg. 38,508, 38,509 (May 7, 2024) ("2024 Rule"). Short-term exposure to these pollutants can result in profound central nervous system effects; chronic exposure can cause brain and kidney damage, cancer, developmental effects, and a range of other adverse health effects. *Id.* at 38,556.

To address those risks, EPA first promulgated hazardous air pollutant standards for coal- and oil-fired power plants in 2012 under Section 112 of the Clean Air Act, 42 U.S.C. § 7412. After hazardous air pollutant emission standards are established, the Act requires EPA to review developments in control technologies to determine if revisions are necessary. *Id.* § 7412(d)(6).

As a result of its Section 7412(d)(6) review, EPA revised the MATS in 2024. The 2024 Rule set more protective limits on arsenic, nickel, and other metals pollution, represented by a surrogate "filterable particulate matter" standard (setting a new "fPM standard"), and further restricted mercury emissions from a

subset of plants using high-polluting lignite coal (the new "mercury standard"). 89 Fed. Reg. at 38,510. The 2024 Rule also required facilities to use continuous emissions monitoring rather than infrequent "stack testing" to demonstrate compliance with the new fPM standard (the "CEMS" requirement). *Id.* And it tightened standards for controlling pollution during plant startup periods. *Id.* EPA projected that the 2024 Rule would reduce annual emissions of mercury by 900 to 1,000 pounds and annual emissions of arsenic, nickel, and other toxic metals by about four to seven tons per year, starting in 2028. *Id.* at 38,561.

The 2024 Rule required coal plants to comply with the startup standard by January 2, 2025, and with the fPM standard, the mercury standard, and other requirements by July 6, 2027. *Id.* at 38,519, 38,564. The 2027 compliance deadline reflected EPA's assessment of the lead time necessary for the regulated coal plants to procure and install necessary emissions controls, upgrade controls, or optimize or dial up controls already installed, and to take other compliance steps that would allow them to meet the requisite standards. *Id.* at 38,519 ("The Agency believes this timeline is as expeditious as practicable considering the potential need for some sources to upgrade or replace pollution controls.").

Earlier this year, on what EPA touted as the "greatest day of deregulation our nation has seen," EPA announced it intended to "reconsider" the 2024 Rule.[2] At the same time, EPA invited coal plants to apply for a two-year Presidential exemption from compliance obligations. EPA subsequently took receipt of numerous such requests.

On April 8, 2025, President Trump issued a Proclamation titled *Regulatory Relief for Certain Stationary Sources to Promote American Energy*, later published in the Federal Register at 90 Fed. Reg. 16,777 (Apr. 21, 2025) ("Exemption Proclamation").[3] The Exemption Proclamation granted an unspecified list of coal plants exemptions from compliance with the 2024 Rule "for the period beginning July 8, 2027, and concluding July 8, 2029." Proclamation Announcement (referring to, but not publishing, an "Annex I" of exempt sources); *see* 90 Fed. Reg. 16,777. The list of exempt coal plants, known as Annex I, was not finalized

---

[2] EPA, News Release, *Trump EPA to Reconsider Biden-Harris MATS Regulation That Targeted Coal-Fired Power Plants to be Shut Down* (Mar. 12, 2025), https://www.epa.gov/newsreleases/trumpepa-reconsider-biden-harris-mats-regulation-targeted-coal-fired-power-plants-be; EPA, News Release, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://www.epa.gov/newsreleases/epa-launches-biggest-deregulatory-action-us-history.

[3] The Exemption Proclamation was published initially on the White House's website: https://www.whitehouse.gov/presidential-actions/2025/04/rregulatory-relief-for-certain-stationary-sources-to-promote-american-energy/ ("Proclamation Announcement").

until six days later, on April 14, 2025, when EPA published the list of facilities to be exempted on its website.[4] EPA's Annex I list was then appended to the Exemption Proclamation for publication in the Federal Register a week later. 90 Fed. Reg. at 16,779-84.

Two months later, on June 11, 2025, EPA signed a notice of proposed rulemaking that proposed to repeal the new fPM standard, the new mercury standard, and the CEMS requirements of the 2024 Rule, and solicited public comment. 90 Fed. Reg. at 25,535. EPA did not propose to repeal the 2024 Rule's startup standard, which is presently in effect. *Id.* at 25,535, 25,539 n.6 (explaining that "EPA is not reconsidering this aspect of the 2024 Final Action").[5]

Petitioners filed this lawsuit on June 12, 2025, challenging EPA's promulgation of the Annex I list of exempt sources.

STANDARD OF REVIEW

Courts have discretion to stay a case to promote efficient use of the court's and litigants' resources, after weighing the benefits and hardships of a stay. *See Landis v. N. Am. Co.*, 299 U.S. 248, 254-55, 259 (1936). But if there is even "a fair possibility" that the stay "will work damage to some one else," the movant must

[4] *Available at* https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf.

[5] The President also issued a second Proclamation on July 17, 2025, directly exempting an additional three coal plants. 90 Fed. Reg. 34,583 (July 23, 2025).

"make out a clear case of hardship or inequity in being required to go forward." *Landis*, 299 U.S. at 255-56 (explaining that "the burden of making out the justice and wisdom" of a stay "lay heavily" on the movant). Thus, the movant must either show that (1) the movant's harms meet the heightened "clear case of hardship or inequity" standard, or (2) the opposing party's claims of hardship are non-existent.

A court is not compelled to stay a live controversy simply because it may become moot in the future. *See Hunt v. Imperial Merchant Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009). "A case is moot 'when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome.'" *Samma v. Dep't of Def.*, 136 F.4th 1108, 1113 (D.C. Cir. 2025) (quoting *Already, LLC v. Nike, Inc.*, 568 U.S. 85, 91 (2013)). Mootness arises only if there is nothing for the court to remedy. *Spencer v. Kemna*, 523 U.S. 1, 18 (1998).

ARGUMENT

I. An Abeyance Would Harm Petitioners Whereas Respondents Fail To Show a Clear Case of Hardship.

Petitioners and their members are being exposed to pollution from exempted coal plants now. By challenging EPA's selection of facilities subject to the President's Exemption Proclamation, this suit seeks to ensure those plants are taking steps *now* to comply with the standards that will alleviate those exposures.

The requested six-month abeyance would prejudice Petitioners' ability to get prompt, meaningful judicial review of the list of facilities selected for exemption,

and thus to restore compliance obligations at plants that were unlawfully exempted. By contrast, Respondents identify no hardship from allowing the case to proceed—at least until Petitioners can be assured they have a suitable forum for their claims—other than the litigation costs necessary to defend their own unlawful actions. The balance of these interests strongly favors Petitioners, and Respondents therefore fail to meet their burden to stay this case at this time. *Landis*, 299 U.S. at 255-56.

Petitioners are environmental and public health organizations with members who live, work, and recreate in areas affected by the mercury, arsenic, and other metals pollution emitted by exempted coal plants. Petitioners' members are concerned that exposure to pollution from exempted plants, including from eating contaminated fish, could have harmful impacts on their health. These concerns also reduce members' enjoyment of outdoor activities in affected areas.

The 2024 Rule will achieve significant reductions in emissions of mercury, arsenic, and other metals each year from coal plants. 89 Fed. Reg. at 38,561. Those emissions reductions—and the steps necessary to secure them—have been occurring since the 2024 Rule took effect and continue apace, as plants take steps to prepare for full compliance by the 2027 deadline. Indeed, states that challenged the 2024 Rule asserted in court filings that "to comply with the Rule's three-year deadline . . . power plants need to take action immediately." *North Dakota v. EPA*,

Case No. 24-1119, ECF 2058570 at 1. Industry parties have also asserted that these years before the 2024 Rule compliance deadlines are necessary for sources to prepare for compliance. *See, e.g.*, Nat'l Mining Ass'n, Comments on the proposed MATS Rule, 88 Fed. Reg. 24,854, at 12 (June 23, 2023), *available at* https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0794-5986. Plants already must comply with the more stringent startup standard, which had a January 2025 compliance deadline. 89 Fed. Reg. at 38,519, 38,564.

At the latest, the emission reductions required by the 2024 Rule must be achieved by the 2027 deadline. But not so for exempted coal plants. Under the terms of the Exemption Proclamations, no emission reductions will be required between 2027 and 2029. Despite the Clean Air Act's limitation of such exemptions to a two-year period, coal plants have *already* stopped working to reduce their emissions or better control their pollution during the present compliance period (as, indeed, the Administration intended): prospective Respondent-Intervenor Talen, an operator and co-owner of an exempted coal plant, stated that the 2024 Rule's compliance deadline "would require substantial and immediate expenditures" but that it has "suspended" compliance activities necessary to meet that deadline "[i]n reliance on the Presidential Exemption." Mot. to Intervene at 3. And others have almost certainly followed suit.

A facility's inclusion on the Annex I list thus delays the benefits of the reductions in emissions from exempted plants' compliance with the 2024 Rule, and prolongs members' exposure to pollution at present, higher levels. It also delays the benefits of continuous emissions monitoring systems, denying Petitioners and Petitioners' members information about coal plant emissions.

Those consequences flow from Annex I's selection of exempted facilities, not from EPA's proposed reconsideration of the 2024 Rule—which did not and could not exempt facilities from compliance with the Rule while it remains good law. The present operation of those exemptions is thus denying Petitioners' members and the public the benefits that would accrue in the absence of those exemptions: both the present-day emission reductions from the startup standard and the present and future emission reductions from sources upgrading or installing emissions controls to comply with the 2024 Rule that is presently in force. Indeed, because EPA, state regulators, and exempted coal plants have asserted that certain coal plants must begin preparations *immediately* to be able to meet standards by 2027, delay in resolving this case could mean compliance by 2027 is not possible, even if the Court ultimately finds it is legally required.[6] *See* Mot. to Intervene at 3

[6] Because exemptions may be extended after the two-year period expires, Petitioners' members and the public face the prospect of damage to their health and recreational interests for years to come. 42 U.S.C. § 7412(i)(4) ("An exemption . . . may be extended for 1 or more additional periods, each period not to exceed 2 years.").

(stating that meeting the 2024 Rule's deadline "would require substantial and immediate expenditures"); *see also* 89 Fed. Reg. at 38,519; *North Dakota v. EPA*, ECF 2058570 at 1, 18. Delaying judicial review would thus delay the cleaner air and better health that flows from lower emissions—and to which Petitioners and their members are legally entitled.

For these reasons, Petitioners must be assured of timely judicial review. Under Respondents' proposed six-month delay—which they have requested both in this case and in the parallel district court case—Petitioners face the "fair possibility" of securing relief too late for exempted plants to achieve compliance by 2027. *Landis*, 299 U.S. at 255. That outcome would "work damage" to Petitioners' members, who will be exposed to more mercury and toxic metal pollution from exempted coal plants pollution that Petitioners seek to reduce by having the exemptions declared unlawful. *Id.* For the same reason Respondents issued the exemptions well in advance of the 2024 Rule's deadlines, Petitioners have a strong interest in resolving the question of their lawfulness well in advance of the deadlines: the exemptions affect present decisions about the timing of emission reductions.

As Petitioners have discussed with Respondents, abeyance of this petition *may* be appropriate in the future, if it becomes clear that district court challenges to the associated Exemption Proclamation are proceeding in a timely enough fashion

to secure the necessary relief. But Respondents have failed to carry their burden of showing a "clear case of hardship or inequity" in being required to go forward without an abeyance, at least until that time. *Id.* at 255-56 ("the burden of making" the case for a stay "lay heavily" on the movants). They assert only that abeyance would "promote judicial economy." Abeyance Mot. at 4. Such an interest falls short of meeting the heightened standard of a "clear case of hardship or inequity," *Landis*, 299 U.S. at 255-56; *see Lockyer v. Mirant Corp.*, 398 F.3d 1098, 1112 (9th Cir. 2005), and is outweighed by Petitioners' interests in protecting the health of their members and the public from unlawful pollution.

That is especially true where the action concerns exemptions that the law does not compel (or, indeed, allow, *see* Complaint, *Air Alliance Houston v. Trump*, Case No. 1:25-cv-1852-PLF (filed June 12, 2025) (asserting that the Exemption Proclamation is *ultra vires*)). It would be inequitable for Respondents to evade timely judicial review of the exemptions they chose to issue, merely because they chose also to reconsider aspects of the 2024 Rule. The Clean Air Act, furthermore, expressly limits EPA's ability to stay the effectiveness of a rule during reconsideration "for a period not to exceed three months." 42 U.S.C. § 7607(d)(7)(B). Respondents should not be permitted to use the court to achieve a back-door stay pending reconsideration for exempted facilities.

Moreover, Respondents cannot reasonably claim that their chosen timing obviates any harm from the exemptions; Respondents chose to exempt a large group of facilities and pursue repeal of the 2024 Rule at the same time, and presumably would not have done so unless they believed the exemptions had their own, present impact. *Landis*, 299 U.S. at 255-56.

II. Respondents' claim that agency action may, in the future, moot this case does not justify abeyance.

Petitioners' challenge to the legality of Annex I presents a live controversy that can be meaningfully remedied and is therefore not moot. *See Samma*, 136 F.4th at 1113 ("A case is moot when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome." (internal quotation omitted)). As explained above, Annex I is final and in effect—as is the 2024 Rule—and guides the activities regulated coal plants are taking (or not taking) right now. As described in Section I above, harm to Petitioners and their members from postponing emissions reductions is ongoing and will only increase as the 2027 deadline grows closer and compliance steps remain unfinished.

That a potential final action by EPA to rescind the 2024 rule "could" moot this case, as Respondents argue, is not sufficient grounds to put the case in abeyance. Where harm is ongoing, timely review is of the essence, and judicial relief would be effective, the Court is not obligated to step aside even where a case might become moot shortly. *See Crawford v. FCC*, 417 F.3d 1289, 1294-95 (D.C.

Cir. 2005) (deciding case where FCC action would effectively moot the claim, but that action had not yet become final); *Lewis v. BT Inv. Managers, Inc.*, 447 U.S. 27, 53 n.15 (1980) (concluding that because challenged state statutes "remain in effect," "the case has not become moot, whatever the ultimate disposition" of pending bills to amend them).[7]

As an initial matter, even if EPA adopts its proposal, it could not entirely moot this case: the 2024 Rule consists of several distinct standards and requirements, and EPA does not propose to repeal or modify *all* of them. For instance, EPA stated that it is "not reconsidering" the more stringent startup standard. 90 Fed. Reg. at 25,535, 25,539 n.6. The Exemption Proclamation, on the other hand, exempts Annex I power plants "from compliance with the Rule," which seemingly includes the 2024 Rule's startup standard. 90 Fed. Reg. 16,777 (Apr. 21, 2025). Thus, the validity of the exemptions effectuated by Annex I would remain a live controversy even if the rule is finalized as proposed.

[7] Other circuits have concluded the same. *See, e.g.*, *Hunt v. Imperial Merch. Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009) (declining to "dismiss a live controversy as moot merely because it may become moot in the near future"); *Muniz v. Sabol,* 517 F.3d 29, 34 (1st Cir. 2008) (controversy "clearly not moot" even where the requested relief would have occurred within a few weeks regardless of the case's outcome); *League of United Latin Am. Citizens v. Bredesen*, 500 F.3d 523, 530 n.5 (6th Cir. 2007) (deciding case where superseding legislation would inevitably moot controversy, but law did not take effect for another month).

In any event, any mootness assessment is premature under the circumstances: We know neither *what* action EPA will take on its proposal, nor *when* it will take it. EPA has only *proposed* to repeal aspects of the 2024 Rule; it must now consider and respond to public comments on that proposal. *See* 42 U.S.C. § 7607(d)(5), (6)(B). The Clean Air Act and Administrative Procedure Act require that EPA's rulemakings be based on consideration of law, data, factual findings, and reasoned decision-making, and reflect input from the public. 42 U.S.C. § 7607(d); 5 U.S.C. § 553. These requirements "ensure that agency regulations are tested via exposure to diverse public comment," and provide "notice and the opportunity to be heard" as an essential component of "fairness to affected parties." *Int'l Union, UMW v. Mine Safety & Health Admin.*, 407 F.3d 1250, 1259 (D.C. Cir. 2005) (cleaned up) (citing *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 547 (D.C. Cir. 1983)).

So, although EPA *could* finalize the action as proposed at the conclusion of the notice and comment process, it runs counter to the core principles of agency responsiveness to the public and regulated community to presume the Agency will. EPA also might issue an action with "major changes" from the proposal—which may not ultimately moot the present controversy. *See* 42 U.S.C. § 7607(d)(6)(A). Indeed, because Annex I serves to exempt the listed coal plants "from compliance with the Rule," 90 Fed. Reg. at 16,777, leaving even a single requirement of the

2024 Rule in place keeps the issues presented in this case "live" and capable of being remedied. *Larsen v. U.S. Navy*, 525 F.3d 1, 3-4 (D.C. Cir. 2008). EPA could also decide to modify its approach and issue a new proposal,[8] or to rescind the proposal altogether. The Court should not stay this case on the mere possibility the 2024 Rule will be repealed as proposed.

We also do not know *when* EPA will take final action on its proposal. Respondents characterize EPA's intention to promulgate a final rule by December 2025 as a "goal," and it is just that. *See* Abeyance Mot. at 4. EPA is not subject to any legal requirement to act by December 2025 or any other date. A nonbinding statement located on a website expressing EPA's intent to act before the end of the year is not sufficiently concrete to warrant abeyance. *See Am. Petrol. Inst. v. EPA*, 683 F.3d 382, 389 (D.C. Cir. 2012) (emphasizing that a settlement required EPA to issue a final rule by a "definite end date"). Indeed, the D.C. Circuit has cautioned that agencies cannot "stave off judicial review of a challenged rule simply by

[8] In fact, EPA requested comment on alternative standards that the Agency should consider in lieu of repealing the 2024 Rule fPM and mercury standards. 90 Fed. Reg. at 25,544-45 (June 17, 2025). Petitioners are among thousands of commenters on EPA's proposed repeal, and commented, among other things, that there *are* cost-effective intermediate standards. *See, e.g.*, Air Alliance Houston et al., Comments of Public Health and Environmental Organizations on Proposed Rule on National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Unit (June 17, 2025), EPA-HQ-OAR-2018-0794-7609, available at: https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0794-7609.

initiating a new proposed rulemaking that would amend the rule in a significant way." *Id.* at 388.

In any event, if history is any guide, final action is far from imminent. December 2025 is an ambitious goal. In practice, it can take EPA a year or longer to finalize action after the notice of proposed rulemaking.[9] Indeed, the Agency's last three MATS rulemakings each took more than a year between proposed and final action. *See, e.g.*, 89 Fed. Reg. at 38,509 (notice of proposed rulemaking published on April 24, 2023; final rule published on May 7, 2024); 88 Fed. Reg. 13,956 (Mar. 6, 2023) (proposed rule published February 9, 2022); 85 Fed. Reg. 31,286, 31,286-87 (May 22, 2020) (proposed rule published February 7, 2019). Especially in an area of great complexity and public interest, there is reason to doubt that EPA will be able to respond to those comments and finalize a rule in half its typical time.

[9] EPA has asserted as much in signed declarations concerning other rules issued under Section 7412. *See, e.g.*, Decl. of Penny E. Lassiter ¶ 4 & tbl., rows 8-10, *Blue Ridge Envtl. Def. League v. Regan*, No. 1:22-cv-03134, ECF No. 36 (D.D.C. Nov. 4, 2024) (stating that the "earliest possible completion date" for a Clean Air Act Section 7412 rulemaking on hazardous waste combustors was 10 months from proposal to final rule); Decl. of Panagiotis E. Tsirigotis ¶ 16 tbl. 3, row 4, ¶¶ 22-24, *Sierra Club v. Pruitt*, No. 1:16-cv-02461-TJK, ECF No. 13-3 (D.D.C. Oct. 19, 2017) (identifying the "minimum number of days" for a Clean Air Act Section 7412 technology review rulemaking on solid waste incinerators as one year from proposal to final rule).

In contrast, should near-term proceedings in the district court demonstrate that litigation in this Court is necessary to protect Petitioners' interests, the present, unlawful and irreparable emission of dangerous pollutants from the Annex I facilities would warrant expedited consideration of this petition. *See* D.C. Cir. Handbook VIII.B. Considering the likelihood of delay in meeting the December 2025 "goal," this Court could be positioned to grant relief before EPA takes final action. Even if Petitioners were to finalize a repeal rule before the Court concluded expedited consideration of this petition, such a repeal might not go into effect before the Court ruled here because any repeal rule may be stayed pending its own course of judicial review. In those circumstances, definitive rejection of EPA's selection of Annex I facilities would still secure important relief for Petitioners.

Finally, proceeding with this litigation while EPA's rulemaking proceeds does not present the concerns identified in *American Petroleum Institute v. EPA*, 683 F.3d 382 (D.C. Cir. 2012), and the other authorities Respondents cite in support of abeyance. Those cases arose in the context of an agency's reconsideration of the very rules being challenged in the litigation they sought to abate. *See, e.g.*, *id.* at 386-88. Here, by contrast, EPA seeks abeyance of litigation challenging Annex I on the basis that it is reconsidering an independent agency action, the 2024 Rule. But neither Annex I nor the exemptions themselves are being reconsidered and neither will be terminated by whatever action EPA decides

to take on the 2024 Rule. As such, the Court is not being asked to review an action that is itself "tentative" or subject to change or "eliminat[ion]." *Id.* at 387-88. And this is not a matter where, as in *Center for Biological Diversity v. EPA*, 56 F.4th 55, 60-61 (D.C. Cir. 2022), *see* Abeyance Mot. at 4, the parties reached a private settlement and jointly requested abeyance to allow time for the settlement's implementation.

CONCLUSION

For the reasons stated above, abeyance in this case is, at a minimum, premature, and could bring about substantial harm. The Court should deny Respondents' motion for a six-month abeyance.

DATED: August 19, 2025

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

AIR ALLIANCE HOUSTON, et al.,

Plaintiffs,

v.

DONALD TRUMP, et al.,

Defendants.

Case No. 1:25-cv-1852-PLF

PLAINTIFFS' MEMORANDUM IN OPPOSITION TO DEFENDANTS' MOTION FOR SIX-MONTH ABEYANCE

In April, President Trump gave nearly one-third of coal-fired power plants across the country a free pass to cease their preparations to meet lower mercury and air toxic emissions standards. EPA updated those standards, known as MATS, just over a year ago. In doing so, EPA recognized that the vast majority of coal-fired power plants were capable of and indeed already limiting their emissions of these dangerous pollutants below what was required in its prior, 2012 standards. Nevertheless, with a stroke of his pen, the President in his April 8, 2025 Proclamation (supplemented in a July 17, 2025 Proclamation) exempted 71 facilities from their compliance obligations through July 2029 by summarily asserting, without evidence or even a gesture at source-specific analysis, that "technology to implement" that Rule is "not available." Proclamation 10914 of April 8, 2025, 90 Fed. Reg. 16,777 (Apr. 21, 2025).

The President's assertion is false,[1] and the President's action is unlawful. That unlawful action is having effects today. As prospective Intervenor-Defendant Talen Montana, LLC,

[1] EPA admitted as much in its recent proposal to repeal the 2024 MATS Rule, writing that the Colstrip Power Plant in Colstrip, Montana, "was *the only* facility unable to meet the lower

ED_021114_00003489-00001

confirms in its motion to intervene, coal plants have already suspended actions to reduce their emissions to comply with updated standards. *See* Talen Memo. in Supp. of Motion to Intervene, Dkt. 29-1 at 4 (asserting that Talen Montana, operator of one of the exempted facilities, "has already made operational planning and compliance decisions in reliance on the Presidential Exemption"). Plaintiffs are entitled to prompt review and judicial relief to minimize and prevent harm to Plaintiffs, their members, and the public from the unlawful exemption proclamations.

The six-month abeyance Defendants request would deprive Plaintiffs of that timely review. A stay would impose substantial hardship on Plaintiffs and their members by depriving them of the emissions reductions that would flow from timely compliance with the standards. Plaintiffs' and the public's interests in promptly achieving the health protections afforded by the updated MATS rule far outweigh the modest burden on Defendants to defend the exemptions. The *potential* future repeal of parts of that rule—which EPA proposes to accomplish through a separate action under separate statutory authority — does not moot and should not delay review of the President's unlawful action. The Court should deny Defendants' abeyance request.

The Court should also deny Defendants' alternative request for a 21-day extension of their responsive pleading deadline. This case has been pending since June 12. Defendants' deadline has already been extended twice, most recently to September 19, 2025. Defendants have not shown good cause for further delay.

BACKGROUND

Coal plants are one of the largest domestic emitters of hazardous air pollutants like mercury, arsenic, nickel, and other toxic metals. *National Emission Standards for Hazardous Air*

[filterable particulate matter] standard with *existing controls*." 90 Fed. Reg. 25,535, 25,541 (June 17, 2025) (emphasis added).

ED_021114_00003489-00002

Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 89 Fed. Reg. 38,508, 38,509 (May 7, 2024) ("2024 Rule"). Short-term exposure to these pollutants can result in profound central nervous system effects; chronic exposure can cause brain and kidney damage, cancer, developmental effects, and a range of other adverse health effects. *Id.* at 38,556.

To address those risks, EPA first promulgated hazardous air pollutant standards for coal- and oil-fired power plants in 2012 under Section 112 of the Clean Air Act, 42 U.S.C. § 7412. After hazardous air pollutant emission standards are established, the Act requires EPA to review developments in control technologies to determine if revisions are necessary. *Id.* § 7412(d)(6).

As a result of its Section 7412(d)(6) review, EPA revised the MATS in 2024. The 2024 Rule set more protective limits on arsenic, nickel, and other metals pollution, represented by a surrogate "filterable particulate matter" standard (setting a new "fPM standard"), and further restricted mercury emissions from a subset of plants using high-polluting lignite coal (the new "mercury standard"). 89 Fed. Reg. at 38,510. The 2024 Rule also required facilities to use continuous emissions monitoring rather than infrequent "stack testing" to demonstrate compliance with the new standards (the "CEMS" requirement). *Id.* And it tightened standards for controlling pollution during plant startup periods. *Id.* EPA projected that the 2024 Rule would reduce annual emissions of mercury by 900 to 1,000 pounds and annual emissions of arsenic, nickel, and other toxic metals by about four to seven tons per year, starting in 2028. *Id.* at 38,561; Ex. 3 to Suppl. Compl. at 8, ECF No. 31-5 (describing emissions reductions in 2028).

The 2024 Rule required coal plants to comply with the startup standard by January 2, 2025, and with the fPM standard, the mercury standard, and other requirements by July 6, 2027. *Id.* at 38,519, 38,564. The 2027 compliance deadline reflected EPA's assessment of the lead time

ED_021114_00003489-00003

necessary for the regulated coal plants to procure and install necessary emissions controls, upgrade controls, or optimize or dial up controls already installed, and to take other compliance steps that would allow them to meet the requisite standards. *Id.* at 38,519 ("The Agency believes this timeline is as expeditious as practicable considering the potential need for some sources to upgrade or replace pollution controls.").

Earlier this year, on what EPA touted as the "greatest day of deregulation our nation has seen," EPA announced it intended to "reconsider" the 2024 Rule.[2] At the same time, EPA invited coal plants to apply for a two-year Presidential exemption from compliance obligations. EPA subsequently took receipt of numerous such requests. Ex. 7 to Suppl Compl. ECF No. 31-9.

On April 8, 2025, President Trump issued a Proclamation titled *Regulatory Relief for Certain Stationary Sources to Promote American Energy*, later published in the Federal Register at 90 Fed. Reg. 16,777 (Apr. 21, 2025) ("Exemption Proclamation").[3] The Exemption Proclamation granted an unspecified list of coal plants exemptions from compliance with the 2024 Rule "for the period beginning July 8, 2027, and concluding July 8, 2029." Proclamation Announcement (referring to, but not publishing, "Annex I" of exempt sources); *see* 90 Fed. Reg. 16,777. The list of exempt coal plants, known as Annex I, was later published by EPA on its

[2] EPA, News Release, *Trump EPA to Reconsider Biden-Harris MATS Regulation That Targeted Coal-Fired Power Plants to be Shut Down* (Mar. 12, 2025), https://www.epa.gov/newsreleases/trumpepa-reconsider-biden-harris-mats-regulation-targeted-coal-fired-power-plants-be; EPA, News Release, *EPA Launches Biggest Deregulatory Action in U.S. History* (Mar. 12, 2025), https://www.epa.gov/newsreleases/epa-launches-biggest-deregulatory-action-us-history.

[3] The Exemption Proclamation was published initially on the White House's website: https://www.whitehouse.gov/presidential-actions/2025/04/regulatory-relief-for-certain-stationary-sources-to-promote-american-energy/ ("Proclamation Announcement").

ED_021114_00003489-00004

website on April 14, 2025,[4] before being appended to the Exemption Proclamation for publication in the Federal Register. 90 Fed. Reg. at 16,779-84.

Two months later, EPA signed a notice of proposed rulemaking that proposed to repeal the new fPM standard, the new mercury standard, and the CEMS requirements of the 2024 Rule, and solicited public comment. 90 Fed. Reg. 25,535 (June 17, 2025). EPA did not propose to repeal the revised startup standard, which is presently in effect. *Id.* at 25,535, 25,539 n.6 (explaining that "EPA is not reconsidering this aspect of the 2024 Final Action").

The President issued a second Proclamation on July 17, 2025, exempting an additional three coal plants. 90 Fed. Reg. 34,583 (July 23, 2025).[5]

Plaintiffs filed this lawsuit on June 12, 2025, challenging the Exemption Proclamation as contrary to 42 U.S.C. § 7412(i)(4) of the Clean Air Act and in excess of legal authority.

STANDARD OF REVIEW

Courts have discretion to stay a case to promote efficient use of the court's and litigants' resources, after weighing the benefits and hardships of a stay. *See Landis v. N. Am. Co.*, 299 U.S. 248, 254-55, 259 (1936); *Allen v. District of Columbia*, No. 20-CV-02453-TSC, 2024 WL 379811 (D.D.C. Feb. 1, 2024). But if there is even "a fair possibility" that the stay "will work damage to some one else," the movant must "make out a clear case of hardship or inequity in being required to go forward." *Landis*, 299 U.S. at 255-56 (explaining that "the burden of

[4] *Available at* https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf.

[5] Unlike the April 8, 2025 Exemption Proclamation, the initial publication of the second Proclamation on the White House's website included the list of facilities to which it applied: https://www.whitehouse.gov/presidential-actions/2025/07/regulatory-relief-for-certain-stationary-sources-to-further-promote-american-energy/.

ED_021114_00003489-00005

making out the justice and wisdom" of a stay "lay heavily" on the movant). Thus, the movant must either show that (1) the movant's harms meet the heightened "clear case of hardship or inequity" standard, or (2) the opposing party's claims of hardship are non-existent.

A court need not "dismiss or stay a live controversy simply because it may become moot in the future." *All. for Wild Rockies v. Gassman*, No. CV-21-105-M-DLC-KLD, 2022 WL 3030997, at *3 (D. Mont. Aug. 1, 2022) (denying Forest Service's request to stay litigation while it reconsidered decision implementing project following court's entry of preliminary injunction) (citing *Hunt v. Imperial Merchant Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009)). "A case is moot 'when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome.'" *Samma v. Dep't of Def.*, 136 F.4th 1108, 1113 (D.C. Cir. 2025) (quoting *Already, LLC v. Nike, Inc.*, 568 U.S. 85, 91 (2013)). Mootness arises only if there is nothing for the court to remedy. *Spencer v. Kemna*, 523 U.S. 1, 18 (1998).

ARGUMENT

I. An abeyance would harm Plaintiffs whereas Defendants do not show a clear case of hardship

Plaintiffs and their members are being exposed to pollution from exempted coal plants now. They seek to enjoin the Exemption Proclamations to ensure those plants are taking steps *now* to comply with the standards that will alleviate those exposures. The requested six-month abeyance would prejudice Plaintiffs' ability to get prompt, meaningful judicial review of the Exemption Proclamations, and thus to restore the compliance obligations at plants that were unlawfully exempted. By contrast, Defendants identify no hardship from allowing the case to proceed, other than the litigation costs necessary to defend their own unlawful actions. The

ED_021114_00003489-00006

balance of these interests strongly favors Plaintiffs, and Defendants therefore fail to meet their burden to stay this case. *Landis*, 299 U.S. at 255–56.

Plaintiffs are environmental and public health organizations with members who live, work, and recreate in areas affected by the mercury, arsenic, and other metals pollution emitted by exempted coal plants. Suppl. Compl. ¶¶ 144, 146, 148-153, 155-160; *see* Decl. of Stephanie Coates ¶¶ 15-19, 23 (attached as Ex. 1); Decl. of Michelle L. Marley-Knox ¶¶ 3-4, 8-9, 12 (attached as Ex. 2); Suppl. Decl. of Michelle L. Marley-Knox ¶¶ 3-4, 6-8 (attached as Ex. 3); Decl. of Derf Johnson ¶¶ 6-9 (attached as Ex. 4); Decl. of Catherine Fleischman ¶¶ 2-3, 7 (attached as Ex. 5); Decl. of Barbara Sue ¶¶ 2-3, 6 (attached as Ex. 6). Plaintiffs' members are concerned that exposure to pollution from exempted plants, including from eating contaminated fish, could have harmful impacts on their health. Suppl. Compl. ¶¶ 144-145, 148-153, 155-160; Coates Decl. ¶¶ 15-17, 21, 23; Marley-Knox Decl. ¶¶ 9-12; Marley-Knox Suppl. Decl. ¶¶ 6, 8; Johnson Decl. ¶¶ 8-9, 11, 13-14; Fleischman Decl. ¶ 4; Sue Decl. ¶¶ 4, 9. These concerns also reduce members' enjoyment of outdoor activities in affected areas. Suppl. Compl. ¶¶ 144, 146-153, 155-160; Coates Decl. ¶¶ 17, 23; Marley-Knox Decl. ¶¶ 8-10, 12; Marley-Knox Suppl. Decl. ¶¶ 6, 8; Johnson Decl. ¶¶ 5-9, 11-14; Fleischman Decl. ¶ 6; Sue Decl. ¶¶ 3-4.

The 2024 Rule will achieve significant reductions in emissions of mercury, arsenic, and other metals each year from coal plants. 89 Fed. Reg. at 38,561. Those emissions reductions—and the steps necessary to secure them—have been occurring since the 2024 Rule took effect and continue apace, as plants take steps to prepare for full compliance by the 2027 deadline. Indeed, states that challenged the 2024 Rule asserted in court filings that "to comply with the Rule's three-year deadline . . . power plants need to take action immediately." Amended Mot. for Stay at 1, *North Dakota v. EPA*, No. 24-1119 (D.C. Cir.), Doc. #2058570 (attached as Ex. 7). Industry

ED_021114_00003489-00007

parties have also asserted that these years before the 2024 Rule compliance deadlines are necessary for sources to prepare for compliance. *See, e.g.*, Nat'l Mining Ass'n, Comments on the proposed MATS Rule, 88 Fed. Reg. 24,854, at 12 (June 23, 2023), *available at* https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0794-5986. Plants already must comply with the more stringent startup standard, which had a January 2025 compliance deadline. 89 Fed. Reg. at 38,519, 38,564.

At the latest, the emission reductions required by the 2024 Rule must be achieved by the 2027 deadline. But not so for exempted coal plants. Under the terms of the Exemption Proclamations, no emission reductions will be required between 2027 and 2029. Despite the Clean Air Act's limitation of such exemptions to a two-year period, coal plants have *already* stopped working to reduce their emissions or better control their pollution during the present compliance period (as, indeed, the Administration intended): prospective Defendant-Intervenor Talen, an operator and co-owner of an exempted coal plant, stated that 2024 Rule's compliance deadline "would require substantial and immediate expenditures" but that it has "suspended" compliance activities necessary to meet that deadline "[i]n reliance on the Presidential Exemption." Mem. in Support of Mot. to Intervene, at 1-2, ECF No. 29-1. And others have almost certainly followed suit.

The Exemption Proclamation thus delays the benefits of the reductions in emissions from exempted plants' compliance with the 2024 Rule, and prolongs members' exposure to pollution at present, higher levels. Suppl. Compl. ¶¶ 144, 146-153, 155-160. It also delays the benefits of continuous emissions monitoring systems, denying Plaintiffs and Plaintiffs' members information about coal plant emissions. Supp. Compl. ¶¶ 150-51.

ED_021114_00003489-00008

Those consequences flow from the Exemption Proclamation, not from EPA's proposed reconsideration of the 2024 Rule—which did not and could not exempt facilities from compliance with the Rule while it remains good law. The present operation of the Exemption Proclamations is thus denying Plaintiffs' members and the public the benefits that would accrue in the absence of those Proclamations: both the present-day emission reductions from the startup standard and the present and future emission reductions from sources upgrading or installing emissions controls to comply with the 2024 Rule that is presently in force. Indeed, because EPA, state regulators, and exempted coal plants have asserted that certain coal plants must begin preparations *immediately* to be able to meet standards by 2027, a delay in resolving this case could mean compliance by 2027 is not possible, even if the Court ultimately finds it is legally required.[6] *See* Mem. in Support of Mot. to Intervene, at 1-2, ECF No. 29-1 (stating that meeting the 2024 Rule's deadline "would require substantial and immediate expenditures"); *see also* 89 Fed. Reg. at 38,519; Amended Mot. for Stay at 1, 18, *North Dakota v. EPA*, No. 24-1119 (D.C. Cir.) (Ex. 7). Delaying judicial review would thus delay the cleaner air and better health that flows from lower emissions and to which Plaintiffs and their members are legally entitled.

For these reasons, this case cannot wait on hold for six months. Under such an extended delay, Plaintiffs face the "fair possibility" of securing relief too late for exempted plants to achieve compliance by 2027. *Landis*, 299 U.S. at 255. That outcome would "work damage" to Plaintiffs' members, who will be exposed to more mercury and toxic metal pollution from exempted coal plants—pollution that Plaintiffs seek to reduce by having the exemptions declared

[6] Because exemptions may be extended after the two-year period expires, Plaintiffs' members and the public face the prospect of damage to their health and recreational interests for years to come. 42 U.S.C. § 7412(i)(4) ("An exemption . . . may be extended for 1 or more additional periods, each period not to exceed 2 years.").

ED_021114_00003489-00009

unlawful. *Id.* For the same reason Defendants issued the exemptions well in advance of the 2024 Rule's deadlines, Plaintiffs have a strong interest in resolving the question of their lawfulness well in advance: the exemptions affect present decisions about the timing of emission reductions.

Defendants have failed to carry their burden of showing a "clear case of hardship or inequity" in proceeding to litigate this case. *Id.* at 255-56 ("the burden of making" the case for a stay "lay heavily" on the movants). Defendants fail to identify any explicit hardship beyond the need to incur the ordinary costs of defending a lawsuit. *See* Mot., at 4, ECF No. 26. Ordinary litigation costs fall short of meeting the heightened standard of a "clear case of hardship or inequity," *Landis*, 299 U.S. at 255-56; *see Lockyer v. Mirant Corp.*, 398 F.3d 1098, 1112 (9th Cir. 2005), and is outweighed by Plaintiffs' interests in protecting the health of their members and the public from unlawful pollution. That is especially true where the action in question concerns *ultra vires* actions of the Executive Branch—and thus where the government's litigation costs have been brought on by their own choice to assert authority not granted to them by Congress.

It would be inequitable for Defendants to evade timely judicial review of the exemptions they chose to issue merely because they chose also to reconsider aspects of the 2024 Rule. That is especially so given that the Clean Air Act expressly limits EPA's ability to stay the effectiveness of a rule during reconsideration "for a period not to exceed three months." 42 U.S.C. § 7607(d)(7)(B). Defendants should not be permitted to use the court to achieve a back-door stay pending reconsideration for exempted facilities.

Moreover, Defendants cannot reasonably claim that their chosen timing obviates any harm from the Exemption Proclamations; Defendants chose to issue exemptions and pursue repeal of the 2024 Rule at the same time, and presumably would not have done so unless they believed the exemptions had their own, present impact. *Landis*, 299 U.S. at 255-56.

ED_021114_00003489-00010

II. Defendants' claim that agency action may, in the future, moot this case does not justify abeyance

Plaintiffs' challenge to the legality of Defendants' Exemption Proclamations presents a live controversy that can be meaningfully remedied and is therefore not moot. *See Samma*, 136 F.4th at 1113 ("A case is moot when the issues presented are no longer live or the parties lack a legally cognizable interest in the outcome." (internal quotation omitted)). As explained above, the exemptions are final and in effect — as is the 2024 Rule — and guide the activities exempted coal plants are taking (or not taking) right now. As described in Section I above, harm to Plaintiffs and their members from postponing emissions reductions is ongoing and will only increase as the 2027 deadline grows closer and compliance steps remain unfinished.

That a potential final action by EPA to rescind the 2024 rule "could" moot this case, as Defendants argue, is not sufficient grounds to put the case in abeyance. Where harm is ongoing, timely review is of the essence, and judicial relief would be effective, "the Court is not obligated to step aside, nor have courts made a habit of doing so—even where a case might become moot shortly." *Conservation Law Found. v. Pritzker*, 37 F. Supp. 3d 254, 265 (D.D.C. 2014); *see also Crawford v. FCC*, 417 F.3d 1289, 1294-95 (D.C. Cir. 2005) (deciding case where FCC action would effectively moot the claim, but that action had not yet become final).[7]

As an initial matter, even if EPA adopts its proposal, it could not entirely moot this case: the 2024 Rule consists of several distinct standards and requirements, and EPA does not propose

[7] Other circuits have concluded the same. *See, e.g.*, *Hunt v. Imperial Merch. Servs., Inc.*, 560 F.3d 1137, 1142 (9th Cir. 2009) (declining to "dismiss a live controversy as moot merely because it may become moot in the near future"); *Muniz v. Sabol*, 517 F.3d 29, 34 (1st Cir. 2008) (controversy "clearly not moot" even where the requested relief would have occurred within a few weeks regardless of the case's outcome); *League of United Latin Am. Citizens v. Bredesen*, 500 F.3d 523, 530 n.5 (6th Cir. 2007) (deciding case where superseding legislation would inevitably moot controversy, but law did not take effect for another month).

to repeal or modify *all* of them. For instance, EPA stated that it is "not reconsidering" the more stringent startup standard. 90 Fed. Reg. 25,535, 25,539 n.6 (June 17, 2025). The Exemption Proclamation, on the other hand, exempts power plants "from compliance with the Rule," which seemingly includes the 2024 Rule's startup standard. 90 Fed. Reg. 16,777 (Apr. 21, 2025). Plaintiffs' counts one, two, and three of their complaint encompass a challenge to the Exemption Proclamation as it relates to compliance with the startup standard. *See* Suppl. Compl. ¶¶ 79-83, 164, 173, 177-179, 183-184. Thus, aspects of the Exemption Proclamation would remain a live controversy even if the rule is finalized as proposed.

In any event, any mootness assessment is premature under the circumstances: We know neither *what* action EPA will take on its proposal, nor *when* it will take it. EPA has only *proposed* to repeal aspects of the 2024 Rule; it must now consider and respond to public comments on that proposal. *See* 42 U.S.C. § 7607(d)(5), (6)(B). The Clean Air Act and Administrative Procedure Act require that EPA's rulemakings be based on consideration of law, data, factual findings, and reasoned decision-making, and reflect input from the public. 42 U.S.C. § 7607(d); 5 U.S.C. § 553. These requirements "ensure that agency regulations are tested via exposure to diverse public comment," and provide "notice and the opportunity to be heard" as an essential component of "fairness to affected parties." *Int'l Union, UMW v. Mine Safety & Health Admin.*, 407 F.3d 1250, 1259 (D.C. Cir. 2005) (cleaned up) (citing *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 547 (D.C. Cir. 1983)).

So, although EPA *could* finalize the action as proposed at the conclusion of the notice and comment process, it runs counter to the core principles of agency responsiveness to public comment to *presume* that it will. EPA also might issue an action with "major changes" from the proposal — which may not ultimately moot the present controversy. *See* 42 U.S.C.

ED_021114_00003489-00012

§ 7607(d)(6)(A). Indeed, because the Exemption Proclamation exempts the listed coal plants "from compliance with the Rule," 90 Fed. Reg. at 16,777, leaving even a single requirement of the 2024 Rule in place keeps the issues presented in this case "live" and capable of being remedied. *Larsen v. U.S. Navy*, 525 F.3d 1, 3-4 (D.C. Cir. 2008). EPA could also decide to modify its approach and issue a new proposal,[8] or to rescind the proposal altogether. The Court should not stay this case on the mere possibility the 2024 Rule will be repealed as proposed.

We also do not know *when* EPA will take final action on its proposal. Defendants characterize EPA's intention to promulgate a final rule by December 2025 as a "goal," and it is just that. *See* Mot. at 4, ECF No. 26. EPA is not subject to any legal requirement to act by December 2025 or any other date. A nonbinding statement located on a website expressing EPA's intent to act before the end of the year is not sufficiently concrete to warrant abeyance. *See Am. Petrol. Inst. v. EPA*, 683 F.3d 382, 389 (D.C. Cir. 2012) (emphasizing that a settlement required EPA to issue a final rule by a "definite end date"). Indeed, the D.C. Circuit has cautioned that agencies cannot "stave off judicial review of a challenged rule simply by initiating a new proposed rulemaking that would amend the rule in a significant way." *Id.* at 388.

In any event, if history is any guide, final action is far from imminent. December 2025 is an ambitious goal. In practice, it can take EPA a year or longer to finalize action after the notice

[8] In fact, EPA requested comment on alternative standards that the Agency should consider in lieu of repealing the 2024 Rule fPM and mercury standards. 90 Fed. Reg. 25,535, 25,544-45 (June 17, 2025). Plaintiffs are among thousands of commenters on EPA's proposed repeal, and commented, among other things, that there *are* cost-effective intermediate standards. *See, e.g.*, Air Alliance Houston et al., Comments of Public Health and Environmental Organizations on Proposed Rule on National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Unit (June 17, 2025) (forthcoming at regulations.gov), *available at* https://tinyurl.com/y2uhtnhk.

ED_021114_00003489-00013

of proposed rulemaking.[9] Indeed, the Agency's last three MATS rulemakings each took more than a year between proposed and final action. *See, e.g.*, 2024 Rule at 38,509 (notice of proposed rulemaking published on April 24, 2023; final rule published on May 7, 2024); National Emission Standards for Hazardous Air Pollutants: Coal-and Oil-Fired Electric Utility Steam Generating Units Revocation of the 2020 Reconsideration and Affirmation of the Appropriate and Necessary Supplemental Finding, 88 Fed. Reg. 13,956 (Mar. 6, 2023) (proposed rule published February 9, 2022) National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Reconsideration of Supplemental Finding and Risk and Technology Review, 85 Fed. Reg. 31,286, 31,286-87 (May 22, 2020) (proposed rule published February 7, 2019). Especially in an area of great complexity and public interest, there is reason to doubt that EPA will be able to respond to those comments and finalize a rule in half its typical time.

In contrast, Plaintiffs believe they can proceed expeditiously, with dispositive motions fully briefed this fall. Considering the likelihood of delay in meeting the December 2025 "goal," Plaintiffs are well-positioned to obtain relief before EPA takes final action.

Finally, proceeding with this litigation while EPA's rulemaking proceeds does not present the concerns identified in *American Petroleum Institute v. EPA*, 683 F.3d 382 (D.C. Cir.

[9] EPA has asserted as much in signed declarations concerning other rules issued under Section 7412. *See, e.g.*, Decl. of Penny E. Lassiter ¶ 4 & tbl., rows 8-10 (Nov. 4, 2024) (submitted in *Blue Ridge Env't Defense League v. Regan*, No. 1:22-cv-03134, ECF No. 36 (D.D.C.) (attached as Ex. 8) (stating that the "earliest possible completion date" for a Clean Air Act Section 7412 rulemaking on hazardous waste combustors was 10 months from proposal to final rule); Decl. of Panagiotis E. Tsirigotis ¶ 16 tbl. 3, row 4, ¶¶ 22-24 (Oct. 19, 2017) (submitted in *Sierra Club v. Pruitt*, No. 1:16-cv-02461-TJK, ECF No. 13-3 (D.D.C.) (attached as Ex. 9) (identifying the "minimum number of days" for a Clean Air Act Section 7412 technology review rulemaking on solid waste incinerators as one year from proposal to final rule).

ED_021114_00003489-00014

2012), and the other authorities Defendants cite in support of abeyance. Those cases arose in the context of an agency's reconsideration of the very rules being challenged in the litigation they sought to abate. *See, e.g.*, *id.* at 386-88. Here, by contrast, Defendants seek abeyance of litigation challenging the Exemption Proclamations because EPA is reconsidering an independent agency action, the 2024 Rule. The *exemptions* are not being reconsidered and will not be terminated by whatever action EPA decides to take on the 2024 Rule; the Court is not being asked to review an action that is itself "tentative" or subject to change or "eliminat[ion]." *Id.* at 387-88. And this is not a matter where, as in *Center for Biological Diversity v. EPA*, 56 F.4th 55, 60-61 (D.C. Cir. 2022), *see* Mot. at 4, ECF No. 26, the parties reached a private settlement and jointly requested abeyance to allow time for the settlement's implementation.

Defendants' motion should be denied.

III. The Court should deny Defendants' alternative request to further extend the responsive pleading deadline

The Court should also deny Defendants' alternative request for a 21-day extension of their deadline to respond to Plaintiffs' complaint. The deadline has been extended twice already, and Defendants have not shown good cause for extending it further. This case has been pending since June. Nothing about the abeyance motion, or the Court's ruling on it, affects *how* Defendants respond to the complaint. The Court should deny their extension request.

CONCLUSION

For the reasons stated above, the Court should deny Defendants' motion for a six-month abeyance and for a further extension of Defendants' responsive pleading deadline.

EXHIBIT 1

Declaration of Stephanie Coates

DECLARATION OF STEPHANIE COATES

I, Stephanie Coates, declare as follows:

1. I submit this declaration on behalf of Environmental Defense Fund ("EDF") to support its litigation challenging President Trump's Proclamation, *Regulatory Relief for Certain Stationary Sources To Promote American Energy*, 90 Fed. Reg. 16777 (Apr. 21, 2025) ("Exemptions Proclamation"), exempting sources from compliance with the U.S. Environmental Protection Agency's ("EPA") final rule: National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 86 Fed. Reg. 38508 (May 7, 2024) ("Final Rule").

2. I am a Climate & Health Project Manager at, and a member of, EDF. I work out of Houston, Texas, where I have lived since 2013. In my role as Climate & Health Project Manager I oversee a project that seeks to characterize concentrations of air toxics in Houston through mobile air monitoring and use these data in conjunction with health data from community health centers to assist community partners in creating disaster response plans. Prior to this role, I was a Community Air Quality Fellow with EDF working directly with grassroots, community-based organizations on their environmental justice priorities with air quality being a concern among all the groups we work with in Houston. EDF also worked with the City of Houston and the community groups to create an automated

air quality report that is generated weekly using data from the community networks and local and state monitors to identify areas with the most National Ambient Air Quality Standards ("NAAQS") exceedances and pinpoint locations with readings above thresholds. The report also includes weather data to identify the likeliest source of the pollution at the time of exceedance. Additionally, EDF engaged with community-based organizations to inform the development of the Climate Vulnerability Index[1] a tool combining 184 different datasets to rank more than 70,000 census tracts to see which communities face the greatest challenges from the impacts of a changing climate. Harris County ranks in the 85th national vulnerability percentile. Census tracts for the community groups we work with in Harris County rank among the top 10% most vulnerable in the nation. Environmental data included in the Climate Vulnerability Index give an indication of a census tract's proximity to transportation sources and exposures to and health risks from other stationary air pollutant sources. As a Fellow, I also supported the community groups in their successful application for an EPA Community Air

[1] *See*, U.S. Climate Vulnerability Index, Overall Climate Vulnerability for Tract 4820121250, https://map.climatevulnerabilityindex.org/map/cvi_overall/tract-48201212500-northeast-houston-houston-tx?mapBoundaries=Tract&mapFilter=9&reportBoundaries=Tract&geoContext=State (showing data for the Houston area).

Quality Monitoring Grant. The main goal of that award will be to conduct mobile monitoring for ethylene oxide, 1,3-butadiene, formaldehyde and acrolein.[2]

3. I understand that the Final Rule addresses toxic pollution from coal-fired power plants by (1) lowering the mercury emission standard for coal plants burning lignite coal; (2) lowering the emission standard for toxic metals such as chromium, nickel, arsenic, lead and others for coal plants; (3) requiring coal plants to use continuous emissions monitoring systems to demonstrate compliance with the standard for non-mercury toxic metals; and (4) updating the definition of "startup" to require coal plants to turn on pollution controls more quickly upon startup. I understand that the Final Rule requires coal plants to comply with the first three requirements by July 8, 2027 and has required coal plants to comply with the new "startup" definition since January 2, 2025.

4. I am also aware that the Exemptions Proclamation exempted 68 coal plants from the Final Rule's standards through July 8, 2029. See EPA, Presidential Proclamation – Regulatory Relief for Certain Stationary Sources to Promote American Energy, at https://www.epa.gov/stationary-sources-air-pollution/presidential-proclamation-regulatory-relief-certain-stationary (providing Annex 1 list of sources exempted by the President).

[2] *See*, EPA, EPA Awards Nearly $500,000 to Texas Organization to improve Air Quality in the Houston Area (Nov. 29, 2023), https://www.epa.gov/newsreleases/epa-awards-nearly-500000-texas-organization-improve-air-quality-houston-area#:~:text=The%20main%20goal%20is,butadiene%2C%20formaldehyde%2C%20and%20acrolein.

5. EDF is deeply engaged in efforts to use monitoring data to inform the public about air pollution, and as explained above, I have been involved in some aspects of this work.[3]

6. EDF has also assisted community groups in Pleasantville, Fifth Ward and Sunnyside to install community-owned air sensor networks measuring particulate matter 2.5 ($PM_{2.5}$), nitrous dioxide (NO_2), and volatile organic compounds. Even though these neighborhoods are overburdened by sources of air pollution such as concrete batch plants/crushers, freeways, metal recyclers, refineries and other industrial activities, the nearest regulatory air monitors are several miles away. By installing their own sensor networks, they are able to identify concerning trends of particulate pollution above NAAQS and with dangerous peaks affecting public health. With EDF's support, community-based organizations in Fifth Ward and Pleasantville were able to successfully advocate for additional state regulatory air monitors to be sited in their neighborhood and increased monitoring and enforcement by County and City officials.

7. EDF has been working with the community of Sunnyside on the southside of Houston since 2020. After a community assessment and asset mapping, residents recognized that the abundance of pollution sources nearby was

[3] *See also* Comments of EDF on Texas Commission on Environmental Quality Proposed 2025 Annual Monitoring Network Plan (May 14, 2025).

directly impacting their health. Zip codes in Sunnyside are considered to have "high asthma burden" due to high utilization of emergency services to treat asthma attacks. EDF encouraged community leaders to join the City of Houston Asthma Coalition to educate residents on asthma management practices. EDF assisted community leaders in Sunnyside to install their air sensor network in 2021 and EDF has provided technical assistance to help residents understand and use the data, which show average $PM_{2.5}$ concentrations in 2023 measuring above NAAQS of 9 $\mu g/m^3$ 62% of the time. EDF is supporting Sunnyside's request that the Texas Commission on Environmental Quality include deployment of a new regulatory monitor in their neighborhood as part of the 2024 Air Monitoring Network Plan. Having information about emissions is essential to understanding public health impacts in these communities. Monitoring data from facilities is essential to ensuring that there is information about the air pollution communities are exposed to.

8. I am aware that sources that are major under Clean Air Act Section 112 are subject to the Clean Air Act's Title V permitting requirements. Title V requires that "a copy of each permit application, compliance plan including the schedule of compliance), emissions or compliance monitoring report, certification, and each permit. . . shall be available to the public." 42 U.S.C. § 7661b(e).

9. Prior to the Final Rule, coal plants that are major could choose to submit only quarterly stack testing results to EPA to demonstrate their compliance with the limits on toxic metals. With the Final Rule's requirement for plants to use continuous emissions monitoring systems, plants will submit hourly compliance data instead of being allowed to submit data from just four test days per year. I understand EPA requirements will further compel coal plants to report their continuous emissions monitoring data to the Emissions Collection and Monitoring Plan System, allowing the public to easily locate, review, and download emissions data using simple, user-directed inquiries. This provides a vital benefit to communities by enabling their access to more comprehensive pollution exposure data that can be used to evaluate individual and community health impacts. This also benefits EDF in its organizational goals to understand and increase awareness of exposure to air toxics and to limit those exposures.

10. Communities are often concerned about emissions from nearby sources of pollution such as coal plants. Having access to hourly source-specific monitoring data that is required to be made available under the Final Rule and Clean Air Act Title V helps reveal the air pollution communities are exposed to and whether additional measures need to be taken in order to reduce pollution from these sources. For example, this data may reveal that a facility is having difficulty with their pollution controls, or that they are not adequately maintaining their

facility as needed to control emissions. Communities can use this data to advocate for better enforcement and compliance by local and state regulatory agencies. Additionally, continuous emissions monitoring will provide residents with more granular information about emissions from nearby coal plants, information they can use to make decisions to better protect their health, for example, whether or not to spend time outdoors, or if it is necessary to use personal protective equipment or air filters in homes and schools.

11. I understand that EPA determined that continuous emissions monitoring could further reduce emissions of non-mercury metals by providing power plant operators with more frequent emissions data, allowing them to quickly identify and address issues with pollution control devices not functioning as expected.[4] EPA determined that this would likely reduce exposures to people living near coal-fired power plants subject to the updated non-mercury toxic metal standard.[5]

[4] EPA, National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review, 89 Fed. Reg. 38508, 38536-37 (May 7, 2024).
[5] *Id.*

12. EDF frequently uses information about sources of air pollution to inform blog posts, reports, fact sheets, and other materials to increase public awareness of threats of air pollution from particular facilities.[6]

13. EDF's ability to carry out its organizational mission to build a vital Earth for everyone is greatly benefited by the Final Rule's new monitoring requirements. The Final Rule allows EDF to expend fewer resources towards obtaining information about sources of air pollution in order to communicate threats about air pollution exposures to the public.

[6] *See, e.g.*, EDF & Environmental Integrity Project, Trump EPA Pollution Pass Map (2025), https://www.edf.org/maps/epa-pollution-pass; EDF, Making the invisible visible: A guide for mapping hyperlocal air pollution to drive clean air action (Oct. 1, 2019), https://www.edf.org/sites/default/files/content/making-the-invisible-visible.pdf; Matt Tresaugue, Houston neighborhood maps decades-old pollution problem, paving way for communities nationwide (Oct. 26, 2018), https://www.edf.org/blog/2018/10/26/houston-neighborhood-maps-decades-old-pollution-problem-paving-way-communities; Jeremy Proville, Understanding how communities are vulnerable to climate change is key to improving equity and justice (Mar. 29, 2023), https://blogs.edf.org/markets/2023/03/29/understanding-how-communities-are-vulnerable-to-climate-change-is-key-to-improving-equity-and-justice/; EDF Business, How Houston's model could change the way cities map air pollution, https://business.edf.org/insights/how-houstons-model-could-change-the-way-cities-map-air-pollution/; EDF, EPA Finds Valero Energy "Significantly Underestimated" Release of Pollution in Houston (Sep. 4, 2017), https://www.edf.org/media/epa-finds-valero-energy-significantly-underestimated-release-pollution-houston; EDF, Finding pollution – and who it impacts most – in Houston (Jun. 3, 2020), https://www.edf.org/airqualitymaps/houston/findings; EDF, Texas Explosion Underscores Need to Hold Polluters Accountable, Protect Community Health (May 6, 2023), https://www.edf.org/media/texas-explosion-underscores-need-hold-polluters-accountable-protect-community-health; Jolie Villegas, We Need to Close a Mercury Pollution Loophole for Lignite Coal Plants (Apr. 12, 2024), https://blogs.edf.org/climate411/2024/04/12/we-need-to-close-a-mercury-pollution-loophole-for-lignite-coal-plants.

14. If coal plants are exempted from the Final Rule until 2029 or longer, EDF will be harmed by the loss of access to this monitoring data for two or more years.

15. As someone who lives and works in Houston, Texas, I have concerns about my exposure to pollution from coal plants, including mercury, which I understand is associated with harms to the nervous system, kidney, and cardiovascular system, and from toxic metals like selenium, chromium, nickel, cobalt, cadmium, beryllium, lead, and manganese which I understand are associated with a variety of health effects including the potential to cause cancer. From my work I know that Houston air quality is plagued by the heavy presence of polluting industry, including coal-fired power plants.

16. On June 4, 2024, I was diagnosed with non-hereditary breast cancer. I am concerned that the persistent presence of air pollution in my community, including the toxic pollution from coal plants that includes known carcinogens, could have increased my risk of developing cancer. I am also concerned that the ongoing toxic pollution from nearby coal plants will exacerbate my health condition and detract from my quality of life.

17. I am concerned about my exposure to air pollution when my family and I spend time outdoors. My family only has one car, which is primarily used by my partner. When I need to run errands or go to appointments during the day, I

usually walk or bike. My family and I regularly walk to the park, coffee shop or to family's house on the weekends. My children walk to school and have recess outdoors most days. As children grow, their developing lungs and brains make them especially vulnerable to air pollution since they breathe more rapidly and inhale more air relative to their size than adults. I receive air quality alerts from the Texas Commission on Environmental Quality and have the Air Quality Index on my smartwatch face, so I am always aware of conditions. If the air quality is unhealthy for sensitive groups such as children, we limit our time outdoors. When there have been air pollution incidents like chemical fires in our region, I use the Clarity openmap and EDF Air Tracker tools to try to understand the threat to my area. I'm grateful that I am aware of such tools so that I can make decisions to protect my and my family's health.

18. We have several coal plants in the surrounding area. The closest coal plant to my home is the W.A. Parish Coal Plant. It is 25 miles from my home. Outside of Houston are also the Martin Lake plant in Tatum; the Oak Grove plant in Petteway; and the San Miguel plant in Christine. I am aware that these plants burn lignite coal, one of the dirtiest types of coal that produces high amounts of mercury emissions. I understand the Final Rule will place a more stringent emissions limit for non-mercury toxic metals for these plants, require them to use continuous emissions monitoring to demonstrate compliance with the limit on non-

mercury toxic metals, and require them to abide by more stringent startup conditions. I understand the Final Rule will require the Martin Lake, Oak Grove, and San Miguel plants to reduce their emissions of mercury.

19. I also understand that all four of these plants are listed on "Annex 1" as plants that the Exemptions Proclamation exempts from the Final Rule's requirements through July 9, 2029. *See* Regulatory Relief for Certain Stationary Sources To Promote American Energy, 90 Fed. Reg. 16777 (Apr. 21, 2025); EPA, Presidential Proclamation Regulatory Relief for Certain Stationary Sources to Promote American Energy, at https://www.epa.gov/stationary-sources-air-pollution/presidential-proclamation-regulatory-relief-certain-stationary (providing Annex 1 list of sources exempted by the President).

20. The Exemptions Proclamation effected these suspensions of the Final Rule's requirements without rulemaking notice and an opportunity for me to comment, or for EDF to comment on my behalf.

21. If I were given an opportunity to comment, or had EDF had the opportunity to comment on my behalf, I could have shared information about my exposures to air pollution and my concerns about my and my family's health as a result of pollution from coal plants and EDF could have shared information about the availability of technology needed for coal plants to comply with the Final Rule.

22. Suspending the Final Rule's CEMS monitoring requirement harms me and EDF by denying me and the organization more detailed and regular information about coal plant toxic emissions that would have otherwise been available under the Final Rule. The exemptions mean we will instead need to rely on infrequent stack test information based on tests conducted merely four times a year.

23. I believe the Final Rule's requirements will lead to improved air quality in the Houston area where I live, work, and raise my children. The Exemptions Proclamation harms me and my family by permitting coal plants to emit more pollution during the period of exemption than they would otherwise emit if required to comply with the Final Rule according to its original compliance schedule.

24. The harms to me and my family would be redressed by a Court Order preventing federal authorities from implementing, enforcing, or recognizing the exemptions. Such a Court Order would ensure that coal plants install the emissions controls necessary to comply with the Final Rule and reduce the pollution harming my family and me.

I declare under the penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

Executed in Houston, TX on May 30, 2025.

Stephanie Coates

EXHIBIT 2

Declaration of Michelle L. Marley-Knox

DECLARATION OF MICHELLE L. MARLEY-KNOX

I, Michelle L. Marley-Knox, declare as follows:

1. My name is Michelle L. Marley-Knox. I am a citizen of the United States, am over 18 years of age, and am competent to give this declaration. All of the information provided is based on my own personal knowledge unless otherwise noted.

2. I am a member of the Environmental Law & Policy Center ("ELPC") and have been involved with ELPC since approximately 2018. ELPC was instrumental in partnering with a coalition of solar businesses that I formed in 2018 and has since provided assistance to me and my business related to energy policy.

3. I currently live in Owaneco, Illinois and have been in my current home since March of 1989. I have lived within thirty miles of the Kincaid power plant for my entire life and often see the pollution it emits from its coal stacks.

4. I own WindSolarUSA, Inc., a renewable energy development company that focuses on designing and installing solar photovoltaics for residential, commercial, and agricultural applications. I formed WindSolarUSA, Inc. in September of 2008 in an effort to offer Illinoisans a level of self-sufficiency and sustainability utilizing clean energy products. We serve Central and Southern Illinois. I have customers living near the Kincaid power plant, including in Taylorville, Glenarm, Rochester, Auburn, Pawnee, Chatham, and Springfield, who have all made a choice to use clean energy for the production of their electricity in an effort to reduce our dependence on fossil fuels.

5. I have completed significant training through the Midwest Renewable Energy Association and am an active member of the Illinois Clean Jobs Coalition, the Illinois Environmental Council, Sierra Club, the Natural Resources Defense Council, and other

organizations through which I take ongoing training to stay abreast of environmental and energy issues that affect our state, nation, and world. I have also served as an instructor of Solar Photovoltaics at Lincoln Land Community College and participate in Workforce Development Program interviews and feedback opportunities in terms of creating clean energy jobs in Illinois.

6. I am involved in community and advocacy work related to environmental and energy issues. I participate every year in the Illinois Environmental Council's Lobby Days in Springfield, Illinois to educate legislators about the importance of clean air, water, and soil. I also work to educate utilities about the importance of using storage to supplement their ability to store and dispatch clean energy in times of peak demand to avoid having to engage peaker plants that are generally aging and tend to be the dirtiest of our generating facilities.

7. I engage with environmental and clean energy issues in both my business and volunteer work because it is important to me that future generations are able to enjoy clean air, clean water, and safe food.

8. I enjoy outdoor recreational activities near the Kincaid power plant such as bicycling on the path from Taylorville to Pana and water activities at Shelbyville Lake. I have always enjoyed fishing, and I grew up fishing with my father in Kincaid Lake. As an adult, I used to enjoy camping at Sangchris Lake State Park and fishing in Sangchris Lake and Taylorville Lake. My friends and I had a lake lot on Taylorville Lake until a few years ago. Each of these lakes is near the Kincaid plant.

9. Over recent years, I have come to understand that the waters in the lakes surrounding the Kincaid plant are contaminated by mercury and other pollutants stemming from the Kincaid plant. Mercury and other hazardous pollutants emitted into the air end up in fish because they settle into lakes or are washed into the water after settling on the ground. I understand

that fish in contaminated lakes can contain mercury, which is dangerous to human health. I have needed to stop fishing and swimming in the water in recent years due to the polluted water.

10. I understand that compliance with the 2024 MATS Rule would improve air and water quality, provide accessible up-to-date emissions information, and help facilitate a transition to clean energy. I understand that the exemption from compliance with the 2024 MATS Rule given to the Kincaid power plant could lead to it operating as a coal-fired power plant for longer than planned and/or being subject to less stringent air toxics standards and monitoring requirements. This would increase air and water contamination.

11. Everyone in my family suffers from a susceptibility to bronchitis at least once per year. We each must carry inhalers to use as needed for wheezing and shortness of breath. An increase in emissions of hazardous air pollutants from coal-fired power plants will adversely affect my health and the health of my family. Further, a lack of up-to-date emissions information would prevent my family and me from effectively evaluating the personal health risks we are exposed to on a day-to-day basis.

12. I looked forward to the positive impacts of the 2024 MATS Rule and the planned closure of the Kincaid power plant so that I could enjoy camping and fishing in the nearby lakes again without concerns for my health. If mercury and air toxics emissions continue to increase, my ability to enjoy fishing and other outdoor recreational activities will be greatly compromised and will degrade my quality of life.

13. Through my work, I know that Illinois has an aggressive Renewable Portfolio Standard ("RPS") that currently has a goal of 40% renewable energy for investor-owned utilities by 2030. That RPS is complimented by the IL Shines Program, which incentivizes all Illinoisans to choose solar energy. Granting an exemption to the 2024 MATS to the Kincaid plant and other

plants in Illinois goes against our state's goals and serves to keep Illinois dependent on sources of energy that have harmful effects to our air and water. This would result in chilling the urgency of people making clean energy choices, which would impact not only our environment and public health, but also the success of my own clean energy business. This exemption, if allowed to stand, will compromise the financial wellbeing of my business.

14. Exempting the Kincaid power plant from the 2024 MATS Rule will significantly jeopardize my personal, health, recreational, and financial interests.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct to the best of my knowledge.

Dated: May 29, 2025

Michelle L. Marley-Knox

Michelle L. Marley-Knox

EXHIBIT 3

Supplemental Declaration of Michelle L. Marley-Knox

SUPPLEMENTAL DECLARATION OF MICHELLE L. MARLEY-KNOX

I, Michelle L. Marley-Knox, declare as follows:

1. My name is Michelle L. Marley-Knox. I am a citizen of the United States, am over 18 years of age, and am competent to give this declaration. All of the information provided is based on my own personal knowledge unless otherwise noted.

2. I signed a declaration on May 29, 2025 as a member of Plaintiff Environmental Law & Policy Center in *Air Alliance Houston v. Trump*, No. 1:25-cv-01852 (D.D.C.), filed on June 12, 2025. All of the information in that declaration remains true and accurate. I give this supplemental declaration to assert new facts which were not relevant at the time of my initial declaration.

3. I recently learned that a July 17, 2025 Presidential Proclamation extended an exemption from compliance with the 2024 MATS Rule to the Dallman Power Plant, Unit 4 ("Dallman 4"), in Springfield, Illinois.

4. I live within approximately forty miles of Dallman 4.

5. I serve as an advisor to Sustainable Springfield, Inc., and am helping to provide comments and information to City Council about creating an energy mix within the city that incorporates more solar and battery storage to help shave peak demand and levelize energy costs for ratepayers.

6. Dallman 4 sits on Lake Springfield. There are many public parks directly across the lake from Dallman 4. I have hosted birthday parties in these parks, attended functions/fundraising events at clubs around the lake, and kayaked the lake. Though I would like to get in the water, swim, and/or fish, I cannot partake in these activities due to concerns about the water quality amplified by the close proximity of Dallman 4.

7. My business, WindSolarUSA, has done many residential installations of solar PV systems in CWLP territory (Springfield's municipal utility). We have also done several installations in Rochester, Illinois, and around Lake Springfield, all of which are close to Dallman Unit 4's coal fired stacks.

8. Given the proximity of Dallman 4 to my home and work sites, I redeclare the health, financial, recreational, and personal interests outlined in my initial declaration as they are similarly threatened by the exemption given to Dallman 4.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct to the best of my knowledge.

Michelle L. Marley-Knox

Michelle L. Marley-Knox

EXHIBIT 4

Declaration of Derf Johnson

DECLARATION OF DERF JOHNSON

I, Derf Johnson, declare as follows:

1. I am over 18 years of age and competent to give this declaration. I have personal knowledge of the following facts, and if called as a witness could testify competently to them. As to those matters which reflect an opinion, they reflect my personal experience, opinion and judgment on the matter.
2. I am a lifelong resident of Montana, and currently reside in Helena, Montana.
3. I have been a member of the Sierra Club since 2018. I am also a member and an employee of the Montana Environmental Information Center ("MEIC"), at which I currently serve as Deputy Director and am responsible for overseeing and supporting programs seeking to maintain a clean and healthful environment for all Montanans. In those capacities, I have worked to address the environmental problems associated with natural resource extraction, with a specific focus on fossil fuel development and climate change.
4. I am a graduate of the University of Montana School of Law. I chose to stay in Montana after law school and begin my career in environmental and natural resources law. I regularly testify before the Montana legislature, state boards, and commissions, on the environmental impacts associated with energy development in Montana, including testimony on the pollution associated with such development. I feel strongly that Montana is one of the most beautiful and spectacular landscapes on Earth and must be protected.
5. I enjoy a variety of outdoor recreational activities. My hobbies include fishing, swimming, floating on water bodies and riverways, and hunting. I also find great joy in

observing the state's abundant wildlife, including bald eagles, elk, and grizzly bears. I spend a majority of my leisure time outdoors and regularly travel around the state.

6. I have regularly visited the Colstrip area for over a decade for both work and leisure purposes. When I first started working at MEIC, I would travel to the Colstrip area once every few months to meet with our members and assess the ecological and policy issues in the area. Since 2016, I travel to the Colstrip area at least one to two times a year. My most recent visit to Colstrip was in August 2024 where I witnessed and photographed devastating ecological damage from the expansion of the Rosebud mine, the coal mine directly adjacent to the Colstrip plant that exclusively supplies its coal, as well as the power plant. I will continue visiting Colstrip and the surrounding area for both work and pleasure, and I am currently planning a trip to southeastern Montana, including the Colstrip area, in mid-June of 2025.

7. I've always had an appreciation for the beautiful landscape of Eastern Montana with its sandstone cliffs, grasslands, rolling hills, and Ponderosa Pine stands. Southeastern Montana in particular is one of the more beautiful and majestic places that I've had the good fortune of visiting. However, on my trips to Colstrip over the past decade, it is really shocking to have watched the landscape continue to degrade because of the Colstrip power plant and associated mining operations. It is disconcerting to see the billowing smokestacks of toxic chemicals in the midst of an otherwise beautiful town with abundant wildlife. The air pollution and other damage I have witnessed, caused by the Colstrip plant, significantly degrades my experience visiting southeastern Montana. At times, I've seen Colstrip's pollution billowing into the sky on the horizon from thirty or forty miles away.

8. I am aware that coal-fired power plants, including Colstrip, emit mercury, toxic metals, particulate matter, sulfur dioxide, nitrogen oxides, and other pollutants which have been linked to serious health complications. I am also aware that these pollutants can be significantly mitigated with pollution controls which the Colstrip plant operators have for decades refused to install. When I'm visiting the area surrounding Colstrip, I'm concerned that I'm being exposed to the hazardous air pollution emitted by Colstrip and the health harms it may cause. My potential exposure to these hazardous air pollutants in the Colstrip region diminishes my enjoyment of activities and makes me concerned for my personal wellbeing. I also know that certain populations are at higher risk for these complications, and it disgusts me that despite evidence on the public health impacts of pollution, modern industry standard pollution controls are not in place at the Colstrip facility. It's alarming that Colstrip knowingly emits harmful pollutants that are linked to illness and death when there are proven technologies to reduce emissions at most (if not all) coal fired power plants in the same class as the Colstrip plant.
9. I have also visited and hunted in the Tongue River Valley on a private ranch about 40 miles as the crow flies from the Colstrip plant. I have every intention to continue visiting the ranch in the future. However, I am deeply concerned about my health and the health of the wildlife that live in this region. Wildlife breathe air and drink water just like people, and I am worried about what kinds of ailments may result from living downwind of the ongoing pollution from the Colstrip plant. I am also aware of the poisoning risks associated with consuming wildlife with bioaccumulated toxics in their tissues. My worry ultimately diminishes my enjoyment of hunting and outdoor recreation in the area, but especially when I am skeptical of being able to safely consume my game.

10. I am aware that the EPA - through the Mercury and Air Toxics Standards ("MATS")- set standards to reduce toxic pollution from coal-fired power plants, which reduces the impact of this pollution. I also understand that EPA has recently updated those standards in a new Technology Review for coal-fired power plants. As a result of that review EPA has, among other things, set lower standards for particulate matter, as a surrogate for toxic metals, emitted by the Colstrip and other coal-fired power plants.
11. I wholeheartedly believe that clean air is absolutely critical for sustaining life in the region. I also do not enjoy being exposed to these pollutants when I travel to the Colstrip area for work or when I am traveling through the town to other locations. I am concerned about the ongoing pollution from the Colstrip power plant from an environmental and public-health perspective.
12. In its rule, EPA established July 2027 as the compliance deadline for the strengthened standards, allowing Colstrip 3 years to achieve compliance. Based upon the amount of pollution that has already been released from Colstrip's sub-par pollution control technology, I view this timeline as incredibly generous. I am extremely concerned that the President has granted an additional 2-year exemption from compliance to Colstrip.
13. I am confident that I would be harmed if Colstrip was able to avoid the new MATs standards for an additional two years. Emissions of particulate matter (including toxic metals) from Colstrip and other existing coal plants would continue at high levels during this time, therefore prolonging the amount of air pollution to which I, my family, and my friends are exposed. If this level of pollution were to continue at the current harmful levels for an additional two years, I would feel less safe on my work and recreational trips to the area, and my enjoyment in doing so would be reduced.

14. If the Colstrip plant were required to reduce its pollution levels during this time, I would feel much more comfortable visiting the area knowing that I'm less likely to be exposed to toxic pollution and would consider visiting the Colstrip area more often.
15. For these reasons, I support MEIC's lawsuit challenging the MATS exemptions and the attempt to stop them from having effect. I believe that if Colstrip is not exempted from compliance with the strengthened MATS Rule by July 2027, my concerns over air pollution and toxic exposure would be at least partially alleviated.

I declare under penalty of perjury that the foregoing is true and correct. Executed this 22nd day of May 2025, in Helena, Montana.

Dert Johnson

EXHIBIT 5

Declaration of Catherine Fleischman

DECLARATION OF CATHERINE FLEISCHMAN

I, Catherine Fleischman, hereby declare as follows:

1. I am currently a member of the Natural Resources Defense Council ("NRDC") and joined in 2025.

2. I live in Davis, West Virginia. I have lived at my current residence full time since 2024, and I have lived here part time since 1999.

3. I spend a significant amount of time outside. I bought this property 30 years ago and retired here specifically because I spend a lot of time outside. I mountain bike, cross country ski, hike, and camp. I am a master naturalist, an avid birder, and I am on the trail maintenance board of the Heart of the Highlands.

4. I personally do not have asthma, but I have concerns that because of environmental deregulation, I will not know what the quality of my air is. I remember in the 1970s that we worked to address the impact of acid rain and smog, and I know of the impact of these and other environmental harms. We have seen huge improvements in air quality since the 1970s, but without regulations, we will not have any ability to know if our air is damaged or unsafe. I am also concerned about my neighbors who are particularly sensitive to air quality – some are on oxygen or have difficulty breathing, and I am concerned about them.

5. I was in West Virginia when the fires in Canada brought all the smoke and haze to our air and I am concerned about coal companies having all the say

about what is in the air – it's everyone's air, not just the coal companies' air! If there were such a thing as clean coal, I would support it, but the current administration gives me no indication that the coal is "clean," as they put it. I am aware that fossil fuels pollute, and coal is a fossil fuel. Mt. Storm burns fossil fuels. There has to be a strong regulatory system to combat the effects of putting pollutants in the air. Davis, West Virginia, where I live, is a high elevation bog, which means that air quality tends to bottle up here because of the valley and the high elevation of the mountains surrounding it. This is a process called inversion, so I'm particularly worried about air quality in my area that results from pollution.

6. I keep track of the air quality in my area by looking at the NOAA website. There is also a weather station near Dolly Sods that reports air quality data, and we often get data from here. We are in an area where cold air sinks and we often record the lowest temperatures in the lower 48. This tendency keeps pollutants in our area longer. I look at my smartphone or check the news for information on air quality every day. If the air quality is bad, I try to limit my outdoor activities, because if I don't, I notice fatigue and lethargy from poor air quality. I have a dehumidifier that filters air quality in my house and an air conditioner unit in my house that filters air.

7. I am concerned about the Mt. Storm power plant near me because it is a fossil fuel plant. I have at times noticed a smell from Mt. Storm, and I have seen

the stacks there for years. I have seen the coal from the mine down the road heading towards Mt. Storm. I can see what is coming out of the smokestacks, and I can see that it comes out 24 hours a day, 7 days a week. I'm a homeowner with solar panels, so I know that there is technology out there that works better than fossil fuel burning. I know we need to transition from burning fossil fuels, and I know that the technology to transition is available, we just need to make the transition. I think that Mt. Storm should do everything it can to limit its toxic air pollution so that it emits very small amounts of pollution - such small amounts of pollution that the environment can dilute it. We need to train ourselves to not add to the toxic burden in our environment, and we should work towards being "net neutral."

8. I am aware that the U.S. EPA finalized new, stronger standards to reduce toxic soot pollution and mercury pollution from power plants in 2024. Some facilities, including Mt. Storm received an exemption from complying with these standards in 2025. I want power plants to do everything they can to meet toxic air pollution standards sooner rather than later, and in particular because of our environmental crisis. Allowing standards to not be met impacts the very near future just as much as it impacts the present. We have answers to this environmental dilemma that are better answers than deregulation. I fully support

NRDC's lawsuit challenging these exemptions from standards for toxic air pollution from power plants.

I declare that the foregoing is true and correct to the best of my knowledge, information, and belief. Executed on May 21, 2025.

EXHIBIT 6

Declaration of Barbara Sue

DECLARATION OF BARBARA SUE

I, Barbara Sue, hereby declare as follows:

1. I am currently a member of the Natural Resources Defense Council ("NRDC") and have been for about one year.

2. I live in Macon, Georgia. I have lived at my current residence since 2003, and I moved back to Georgia in 2001.

3. I limit the amount of time I spend outside because I have such severe allergies. I used to like to walk outside a lot, but now I do much of my exercises indoors. I limit my time outside to yardwork, watering my plants, cleaning out the bird baths, and tending to the plants on the porch.

4. I have very severe ongoing allergies – they are not just limited to spring and summer, they last throughout the year, and they get worse and worse every year. I have sinus problems for which I take a number of medications, and I get frequent sinus infections which cause me to need antibiotics. I also now have fluid in my ears that I think the allergies have contributed to as well. My husband also has allergies, but he does not have them as bad as me. My adult daughter, who lives nearby, also gets severe allergies and migraines, like me. I was prescribed albuterol by my doctor since I was coughing at night and occasionally experiencing chest tightness. I thought my allergies were just attributable to pollen, but I am now concerned that they are exacerbated by air pollution.

5. I sometimes keep track of the air quality on my smartphone or watch, but since I try to limit my time outside, I do not keep track of it regularly. I have an air purifier in my bedroom to help with my allergies.

6. Ever since I moved back to Georgia, my allergies have gotten worse. I am concerned about the impact that climate change is having on our environment, and that those impacts are also contributing to my allergies. For example, because of climate change, the plants are blooming earlier and earlier and releasing their pollen earlier than usual. I live near the Scherer power plant, and I'm concerned that air pollution plays a role in my allergies as well.

7. I believe we should do everything in our power to make sure that the air and water is not uninhabitable for animals and for biodiversity – we need everything on the planet to help clean the planet, and everything is interconnected. We are animals too, and we need to be good stewards of the planet. The current administration at EPA is trying to repeal regulations, and rolling back these regulations will set us back one hundred years.

8. I am very concerned that Georgia Power has gotten a two-year extension for their power plants. I want power plants to do everything that they can to clean up their toxic pollution – we are caretakers of the world, and we need to do better. God did not make us caretakers of the animals and the earth so we could be supreme over them, it's our responsibility to care for them. Now that we know

how to take care of the earth, we can and should right all the wrongs we did to the planet unintentionally. Now that we know better, we should do better, and shame on us for not doing that.

9. I am aware that the U.S. EPA finalized new, stronger standards to reduce toxic soot pollution and mercury pollution from power plants in 2024. Some facilities, including Scherer, received an exemption from complying with these standards in 2025. I want power plants to do everything they can to meet toxic air pollution standards as soon as possible, and I do not think deregulation is the answer. I fully support NRDC's lawsuit challenging these exemptions from standards for toxic air pollution from power plants.

I declare that the foregoing is true and correct to the best of my knowledge, information, and belief. Executed on May 28, 2025.

CERTIFICATE AS TO PARTIES, RULINGS, AND RELATED CASES

Pursuant to D.C. Circuit Rules 18(a)(4), 27, and 28(a)(1)(A), Petitioners certify:

A. Parties, Intervenors, and *Amici* to this Case (No. 24-1119)

Petitioners: State of North Dakota, State of West Virginia, State of Alaska, State of Arkansas, State of Georgia, State of Idaho, State of Indiana, State of Iowa, State of Kansas, Commonwealth of Kentucky, State of Louisiana, State of Mississippi, State of Missouri, State of Montana, State of Nebraska, State of Oklahoma, State of South Carolina, State of South Dakota, State of Tennessee, State of Texas, State of Utah, Commonwealth of Virginia, and State of Wyoming.

Respondent: The United States Environmental Protection Agency.

Proposed Intervenors: (1) Air Alliance Houston, Alliance of Nurses for Healthy Environments, American Academy of Pediatrics, American Lung Association, American Public Health Association, Chesapeake Climate Action Network, Citizens for Pennsylvania's Future, Clean Air Council, Clean Wisconsin, Downwinders at Risk, Environmental Defense Fund, Environmental Integrity Project, Montana Environmental Information Center, Natural Resources Council of Maine, Natural Resources Defense Council, the Ohio Environmental Council, Physicians for Social Responsibility, and Sierra Club moved to Intervene on June 3, 2024; (2) State of Massachusetts, State of Minnesota, State of Connecticut, State of Illinois, State of Maine, State of Maryland, State of Michigan, State of New Jersey, State of New York, State of Oregon, State of Pennsylvania, State of Rhode Island, State of Vermont, State of Wisconsin, District of Columbia, City of Baltimore, City of Chicago, City of New York moved to intervene on June 6, 2024; (3) San Miguel Electric Cooperative, Inc. moved to intervene on June 7, 2024.

Proposed *Amici*: None at present.

B. Rulings Presented for Review

Final rule entitled *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*. 89 Fed.Reg. 38508 (May 7, 2024).

C. Parties, Intervenors, and Amici in Related Cases in this Circuit

Consolidated cases: (1) *NACCO Natural Resources Corp. v. EPA and Michael S. Regan*, No. 24-1154; (2) *National Rural Electric Cooperative Association, Lignite Energy Council, National Mining Association, Minnkota Power Cooperative, Inc., East Kentucky Power Cooperative, Inc., Associated Electric Cooperative Inc., Basin Electric Power Cooperative, and Rainbow Energy Center, LLC v. CERTIFICATE OF COMPLIANCE WITH RULES 18(A)(1) AND (A)(2)

The undersigned certifies that this motion complies with Fed. R. App. P. and D.C. Cir. R. 18(a)(1). On May 14, 2024, Petitioners submitted to EPA a Request for Administrative Stay Pending Judicial Review of the *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, published in the Federal Register at 89 Fed.Reg. 38508 (May 7, 2024). EPA acknowledged receipt of this request on May 21, 2024, but has not otherwise responded.

In accordance with Fed. R. App. P. and D.C. Cir. R. 18(a)(2), counsel for Petitioners notified EPA's counsel by voicemail and email on June 3, 2024, that Petitioners planned to file this motion. EPA opposes this motion.

GLOSSARY OF KEY ABBREVIATIONS AND ACRONYMS

Abbreviation Or Acronym	Defined
CAA	Clean Air Act
EGU	Electric Utility Steam Generating Units
EPA	Environmental Protection Agency
fPM	Filterable Particulate Matter
HAP	Hazardous Air Pollutant
Hg	Mercury
MATS	Mercury and Air Toxics Standards
RIA	Regulatory Impact Analysis

INTRODUCTION

With this Rule, EPA is ratcheting down the Mercury and Air Toxics Standards (MATS) for coal-fired power plants by 66-70%. The implementation costs will be substantial, power plants may be forced onto early retirement tracks, and power grid reliability will be threatened. Conversely, there is no relevant public health benefit from the mandated reduction in hazardous air pollutant (HAP) emissions. None. EPA recognizes that the 2012 MATS rule already reduced HAP emissions **well below** any threshold that would impact public health.

Petitioners will establish multiple legal infirmities on the merits requiring the Rule be set aside. But that victory will be meaningless absent a stay, because to comply with the Rule's three-year deadline for implementing the mandated changes (or retiring if they cannot), power plants need to take action immediately. EPA knows this. The last time the MATS Rule was litigated, the Supreme Court held EPA acted "unreasonably when it deemed cost irrelevant to the decision to regulate power plants." *Michigan v. EPA*, 576 U.S. 743, 760 (2015). But the victory proved hollow, because without a stay while the merits were heard, power plants were forced to make compliance and retirement decisions, resulting in billions expended and many plant closures in response to an unlawful regulation. The last time the MATS Rule was litigated is a textbook example for when agency rules should be

stayed. *E.g.*, Ronald Cass, *Staying Agency Rules: Constitutional Structure and Rule of Law in the Administrative State*, 69 Admin. L. Rev. 225, 254-57 (2017).

While EPA claims this Rule will have no impact on the power grid or energy prices, Petitioners have included with this motion an array of declarations from power plants and State regulators attesting that is not the case. And EPA has an established record of grossly understating the effect its rules will have on the power grid. The last time the MATS Rule was litigated, EPA assured the country that it would only cause about 5,000 MW to go offline. EPA was wrong. The number ended up being closer to 60,000 MW. Our power grids do not have the same buffer of dispatchable energy that they did a decade ago. If EPA is wrong to the same degree that it was last time, the impact to our power grids will be substantial.

Petitioners ask the Court to preserve the status quo by staying the Final Rule until the merits of this dispute are resolved. An expedited briefing schedule will limit the duration of any such stay.

BACKGROUND

Section 112 of the Clean Air Act (CAA) (codified at 42 U.S.C. § 7412) provides EPA statutory authority to set emission levels for certain HAPs enumerated in Section 112(b)(1). *Sierra Club v. EPA*, 895 F.3d 1, 7 (D.C. Cir. 2018). As EPA acknowledges, "Congress intended for CAA Section 112 to achieve significant reductions in HAP." 89 Fed.Reg. at 38535.

EPA issued the original MATS rule for HAP emissions from coal- and oil-fired electric generating units (EGUs) in 2012. 77 Fed.Reg. 9304 (Feb. 16, 2012). That rule identified different achievable control standards for mercury from EGUs that use lignite coal compared to other types of coal. The distinction was based on science: lignite is more variable than other types of coal and available technologies cannot consistently achieve the same control levels. 77 Fed.Reg. at 9393.

Eight years after a HAP emission level is set, EPA must evaluate if any "residual risks" remain to public health from those HAP emissions and whether there have been any developments in available control technologies. 42 U.S.C. §§7412(f)(2), (d)(6). EPA calls these the Residual Risk and Technology Reviews.

In 2020, EPA conducted those reviews for the MATS Rule. For the Residual Risk Review, EPA "determined that the current [standard] provides an ample margin of safety to protect public health and prevent an adverse environmental effect." 85 Fed.Reg. 31286, 31314 (May 22, 2020). And for the Technology Review, EPA determined there were no developments in emission control technologies, practices, or processes that warranted revising the MATS Rule. *Id.* at 31298.

But six months later there was a change in presidential Administration and Executive Order 13990, entitled "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis," which directed EPA to consider "suspending, revising, or rescinding" the 2020 Residual Risk and Technology

Reviews for the MATS Rule. 86 Fed.Reg. 7037 (Jan. 25, 2021). That was so despite the fact that EPA's authority for promulgating the MATS Rule under CAA Section 112 has nothing to do with climate change—it is about protecting the public from specified HAPs, not greenhouse gases.

Following Executive Order 13990, EPA reconsidered its 2020 Residual Risk and Technology Reviews for the MATS Rule. For public health, EPA reached the same conclusion. 88 Fed.Reg. 24854, 24895 (Apr. 24, 2023) ("the residual risk assessment showed all modeled exposures to HAP to be below thresholds for public health concern."). That should have been the end of it. In other Section 112(d)(6) rulemakings, EPA has taken the position that if its standards already "provide an ample margin of safety to protect public health and prevent adverse environmental effects, one can reasonably question whether further reviews of technological capability are 'necessary.'" 69 Fed.Reg. 48338, 48351 (Aug. 9, 2004); *see also* 71 Fed.Reg. 76603, 76608 (Dec. 21, 2006). But EPA pressed on.

For its technology re-review, EPA again found "no new practices, processes, or control technologies" for the relevant HAP emissions. 88 Fed.Reg. at 24868. The control technologies used in 2012 are the same as today. *See* 2023 Technology Review for the Coal- and Oil-Fired EGU Source Category ("2023 Tech Review") at 1; 2024 Update to the 2023 Proposed Technology Review for the Coal- and Oil-

Fired EGU Source Category ("2024 Tech Update") at 17, 50.[1] Undeterred, to justify revising the standards, EPA points to alleged cost efficiencies for using those technologies, concluding those alleged efficiencies mean that all coal-fired plants, regardless of configuration or coal type, can now meet a 66% lower surrogate fPM emission standard for non-mercury HAPs. 89 Fed.Reg. at 38530.[2] For mercury, EPA concludes lignite is now capable of meeting the same control standard as other types of coal, dropping the emission standard by 70%. 89 Fed.Reg. at 38586. Coal-fired power plants must meet the new standards in three years or be on a retirement track. 89 Fed.Reg. at 38519.

ARGUMENT

The Court should stay the Rule while the merits are resolved because Petitioners are likely to prevail on the merits of their claims, Petitioners will suffer irreparable harm in the absence of a stay, and the balance of harms and public interest favor a stay. D.C. Cir. R. 18(a)(1).

[1] For non-mercury HAPs, the control technology remains electrostatic precipitators and fabric filters, and for mercury the control technology remains activated carbon injection. 2023 Tech Review at 16–18; 2024 Tech Update at 30–32.

[2] The Final Rule uses filterable particulate matter (fPM) as a surrogate for measuring the non-Hg metal HAP emissions. 89 Fed.Reg. at 38508.

I. Petitioners Are Likely to Prevail on the Merits

A. The Rule Violates Clean Air Act Section 112(d)(6) Because Revising the MATS Standard Is Not "Necessary"

EPA issued this Rule under CAA Section 112(d)(6), which permits revising HAP emission standards only as "necessary (taking into account developments in practices, processes, and control technologies)." 42 U.S.C. § 7412(d)(6). The operative phrase is "revise as necessary," and "EPA must consider practical and technological advances" when determining whether revision is "necessary." *La. Envtl. Action Network v. EPA*, 955 F.3d 1088, 1097-98 (D.C. Cir. 2020).

The Rule's revisions are not "necessary" for several reasons.[3] For one, there is no relevant public health benefit. EPA acknowledges current HAP emission standards provide an ample margin of safety to protect public health and does not identify *any* quantifiable health benefit from the Rule's further reduction in HAPs. 89 Fed.Reg. at 38558-59. The alleged health "benefits" EPA purports to quantify—reducing criteria pollutants and greenhouse gases, *id.* at 38561-62—cannot serve as a basis for exercising Section 112(d)(6) authority.

Absent any relevant public health benefits from the Rule, EPA claims the revisions are "necessary" due to "developments" in controlling HAP emissions. *Id.* at 38518. But even if a "development" in control technologies could make revising

[3] Black's Law Dictionary (11th ed. 2019) (*Necessary*: "needed for some purpose or reason; essential.").

a HAP emission standard that provides no relevant health benefits "necessary" under Section 112(d)(6), EPA identified no new technologies, practices, or processes that would justify revising the MATS Rule. 42 U.S.C. § 7412(d)(6). The primary control technologies used today are the same as they were the last two times EPA undertook a technology review. 89 Fed.Reg. at 38517-18.

Rather than pointing to any new technology, EPA interprets "development" to mean cost-efficient compliance with already-existent technology. *Id.* at 38510. That interpretation of "development" is an atextual attempt to expand EPA's regulatory reach. *Cf. Nat. Res. Def. Council v. EPA*, 529 F.3d 1077, 1084 (D.C. Cir. 2008) (Section 112(d)(6) rulemaking revises "*technology-based* standards in light of *technological* developments" and requires identification of "*technological innovations*") (emphases added).

EGUs are *required* to comply with HAP emission standards after they are issued, and they must comply with a margin that accounts for fuel variability to consistently meet the emission standard 100% of the time. EPA's interpretation of such compliance as a "development" warranting further rulemaking constitutes a significant power grab—ignoring Section 112(d)(6)'s constraint to only revise the standards as "necessary," and empowering EPA to drive any disfavored source out of the market by tightening HAP emission limits until an emission source with a variable fuel supply is unable to comply *at all times*.

B. The Rule is Arbitrary and Capricious for Multiple Reasons

A rule is arbitrary and capricious "if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem…or is so implausible that it could not be ascribed to a difference in view of the product of agency expertise." *Motor Vehicle Mfrs. Ass'n v. State Farm*, 463 U.S. 29, 43 (1983). This Rule is arbitrary and capricious for many reasons, each of which warrants vacating it.

First, EPA's cost-benefit analysis is indefensible. Section 112(d)(6) rulemaking requires reasonable consideration of cost. *See Ass'n of Battery Recyclers v. EPA*, 716 F.3d 667, 673-74 (D.C. Cir. 2013) (rejecting argument cost is irrelevant to emission standard revisions under Section 112(d)(6)). Yet EPA candidly admits the Rule has a "negative net monetized benefit." 89 Fed.Reg. at 38511. Under the standards already in place, EPA found the lifetime cancer risk of the person most exposed to coal-fired HAP emissions is 0.344-in-a-million—significantly less than the Clean Air Act's one-in-a-million threshold where EPA can stop regulating a source entirely. 42 U.S.C. § 7412(c)(9)(B)(i); *see also Nat. Res. Def. Council*, 529 F.3d at 1082 (one-in-one million standard is the CAA's "aspirational goal").

Even EPA's qualitative generalizations don't evidence any meaningful health benefits from the mandated reduction in HAPs. EPA admits the benefits of Hg reduction associated with the Rule are so small they can't be reliably extrapolated to

the broader population of fish consumers. RIA 4-5. And where risk to subsistence fishers located near lignite-fired plants has been studied, fisherman are already not exposed at a level associated with appreciable risk—and that is before the further reductions associated with this Rule. RIA 4-4. EPA's analysis of non-Hg HAP emissions is much the same, with EPA acknowledging "cancer risk was … within the acceptable range for multipathway exposure to the persistent and bioaccumulative non-Hg HAP metals." RIA 4-7. Likewise, noncancer risks did not exceed current thresholds for adverse health effects. *Id.*

To the extent EPA identified any quantifiable "benefits" of the Rule, they are *all* ancillary to the Rule's reduction in HAP emissions and cannot drive a Section 112 cost-benefit analysis. *E.g.*, 89 Fed.Reg. at 38561 (pointing to alleged particulate matter, ozone, and "climate" benefits). As Chief Justice Roberts noted during oral argument in *Michigan v. EPA*, it is improper for EPA to use Section 112 authority to "get at the criteria pollutants that you otherwise would have to go through a much more difficult process to regulate. In other words, you can't regulate the criteria pollutants through the HAP program…" Transcript of Oral Argument at 59:19–60:5, *Michigan v. EPA*, 576 U.S. 743 (2015). *Cf. Wyoming v. Dep't of Interior*, 493 F. Supp. 3d 1046, 1079 (D. Wyo. 2020) (agency "cannot rationally claim the Rule's objective is waste prevention while justifying its considerable costs almost entirely on climate change benefits").

In exchange for zero relevant public health benefits, the Rule will impose tremendous costs on coal-fired EGUs and electricity consumers. Under EPA's own calculations, the estimated cost-per-ton of HAP removed exponentially exceeds cost-benefit ratios that EPA has rejected for other Section 112 rulemakings. For surrogate fPM emissions, by EPA's own math, the cost effectiveness is $10.5 million per ton of HAP removed. 89 Fed.Reg at 38532-33. That is orders of magnitude higher than cost-benefit ratios EPA has explicitly *rejected* as being excessive. *E.g.*, Westmoreland Mining Holdings Cmt. at 4, EPA-HQ-OAR-2018-0794-5935 (compiling examples). EPA admits as much. 89 Fed.Reg. at 38523 ("EPA acknowledges that the cost-effectiveness values for these standards are higher than cost-effectiveness values that the EPA concluded were not cost-effective…for some prior rules.") 89 Fed.Reg. at 38523. These costs will likely force power plant retirements and threaten grid reliability, *see infra*, but, even if they didn't, they will increase the price of electricity for consumers. Just as it is arbitrary and capricious for EPA to impose significant economic costs "for a few dollars" of benefit, *Michigan*, 576 U.S. at 752, so too where EPA imposes substantial costs with "no meaningful benefit." *Mexican Gulf Fishing Co. v. U.S. Dep't of Comm.*, 60 F.4th 956, 966 (5th Cir. 2023).

Second, even assuming cost-efficient compliance using existing technology can lawfully be considered a "development" in practices, processes or control

technologies warranting further restrictions under Section 112(d)(6), EPA has not provided a reasoned explanation to support its conclusion that coal-fired EGUs are capable of consistently meeting the Rule's new emission standards with available control technologies. Comment after comment put EPA on notice that the Rule's conclusions regarding compliance feasibility were flawed.[4] But to support its contrary conclusion, the Final Rule relies almost entirely on a single comment (the "Andover Report") that largely parrots EPA's conclusions from the proposed rule without sufficient factual basis or explanation and is woefully inadequate to support EPA's conclusions. *E.g.,* 89 Fed.Reg. at 38523, 38528, 38530, 38538.

Third, EPA failed to adequately consider the Rule's foreseeable impact on our nation's already-precarious power grids. Where, as here, EPA promulgates a Rule under Section 112(d) that will foreseeably impact grid reliability, it must thoroughly address the concern. *Del. Dep't of Nat. Res. & Envtl. Control v. EPA*, 785 F.3d 1, 18 (D.C. Cir. 2015) ("'Costs' can mean many different things, including the cost associated with increased risk" of grid unreliability).

EPA's perfunctory conclusion that the significant costs the Rule imposes on coal-fired EGUs will have no effect on the power sector, 89 Fed.Reg. at 38555-56,

[4] *E.g.,* Lignite Energy Council Cmt. at 8-9, EPA-HQ-OAR-2018-0794-5957; Nat'l Mining Ass'n Cmt. at 10-15, EPA-HQ-OAR-2018-0794-5986; Westmoreland Mining Holdings Cmt. at 16-17 (proposed fPM standard is not achievable or feasible); Coal Conversion Counties Ass'n Cmt. at 8, EPA-HQ-OAR-2018-0794-6003 (proposed mercury standard is not achievable or feasible).

does not reflect reasoned analysis entitled to any degree of deference. "EPA has no expertise on grid reliability," *Texas v. EPA*, 829 F.3d 405, 432 (5th Cir. 2016), and comment after comment put EPA on notice that the Rule will foreseeably have significant impacts on power grid reliability.[5] Nonetheless, the Final Rule does not reflect any attempt by EPA to seek input from the Federal Energy Regulatory Commission (FERC), the North American Electric Reliability Corporation (NERC), or any similar entity that could have apprised it of the Rule's likely impact on grid reliability. EPA also failed to address power outages or grid reliability in its Regulatory Impact Analysis. *See* RIA Section 3. EPA's failure to adequately consider one of the Rule's most important impacts was arbitrary and capricious. *State Farm*, 463 U.S. at 43; *see also Del. Dep't of Nat. Res.*, 785 F.3d at 18 (encouraging EPA to solicit input from FERC).

Moreover, as noted *supra*, the last time the MATS Rule was litigated, EPA claimed it would only cause about 5,000 MW to go offline. 77 Fed.Reg. at 9407 ("...expected retirements of coal-fueled units as a result of this final rule (4.7 GW) are fewer than was estimated at proposal and much fewer than some have

[5] *E.g.*, Rainbow Energy Center Cmt. at 4, EPA-HQ-OAR-2018-0794-5990; *see also id.*, Attachment A at 3-4 (MISO Cmt. on Docket ID Nos. EPA-HQ-OLEM-2021-0283, EPA-HQ-OLEM-2021-0282, EPA-HQ-OLEM-2021-0280); Minnkota Power Coop. Inc. Cmt. at 3, EPA-HQ-OAR-2018-0794-5978; Power Generators Air Coalition Cmt. at 12, EPA-HQ-OAR-2018-0794-5994.

predicted"). EPA was wrong. It ended up being closer to 60,000 MW.[6] That dramatic difference represents a profound failure on EPA's part to analyze the rule's impacts on power generation. Consequently, EPA's perfunctory conclusion that this Rule (dropping emission standards by 66-70%) will not cause a single retirement, RIA at 3-16, should be viewed with extreme skepticism given the number of comments and declarations attesting EPA has gotten it profoundly wrong again.

EPA's analysis of the Rule's grid impacts also fails to "acknowledge and account for" the impacts of "contemporaneous and closely related rule[s]." *Portland Cement Ass'n v. EPA*, 665 F.3d 177, 187 (D.C. Cir. 2011). EPA expressly issued this Rule as part of a "suite" of rules targeting coal power plants with retirement-inducing costs. *See* EPA, *Biden-Harris Administration Finalizes Suite of Standards to Reduce Pollution from Fossil Fuel-Fired Power Plants* (Apr. 25, 2024).[7] EPA's

---

[6] *See, e.g.*, U.S. Energy Info. Admin., *Planned coal-fired power plant retirements continue to increase* (Mar. 20, 2014), bit.ly/4dbYwfM (between 2012 and 2020, "about 60 gigawatts of coal-fired capacity is projected to retire … assum[ing] implementation of the MATS standards"); Pratson et. al., *Fuel Prices, Emission Standards, and Generation Costs for Coal v Natural Gas Power Plants*, Am. Chem. Soc'y, Env'l Sci. & Tech., 4929 (Mar. 2013), bit.ly/3w7yLN2 (most coal-fired EGU retirements in the wake of the original MATS Rule were due to "stronger regulations," not unrelated market forces); *see also* Nat'l Min. Ass'n Cmt. at 2 & n.4, EPA-HQ-OAR-2009-0234-20531 (for the nearly 60 gigawatts of coal-fired EGU retirements announced between 2012 and 2016, "virtually all" stated the closures were "either fully or partially attributable to MATS and other EPA regulations").

[7] Available at https://tinyurl.com/y5u92sx3.

failure to meaningfully assess how the confluence of these (and many other) rules targeting coal-fired power plants will affect the power grid further cements its arbitrary and capriciousness.

Fourth, the Rule is arbitrary and capricious because EPA's stated reasons for it are pretextual. When an agency promulgates a rule, it must truthfully "disclose the basis of its action," and courts must set aside rulemaking when "the evidence tells a story that does not match the explanation." *Dep't of Commerce v. New York*, 139 S. Ct. 2551, 2575-76 (2019). Despite claiming it engaged in this rulemaking to protect the public from specified HAP emissions, 89 Fed.Reg. at 38509-10, available evidence not least of which is the Executive Order *on climate change* which EPA admits spurred this rulemaking indicates EPA is using its Section 112(d)(6) authority as part of an effort to force a nationwide transition away from coal for putative climate change reasons. *Contra West Virginia v. EPA*, 597 U.S.697, 735 (2022) (declaring it "not plausible" the CAA empowers EPA to "force a nationwide transition away from the use of coal to generate electricity").

Internal documents produced through FOIA indicate EPA and the White House Climate Office contrived revising the MATS Rule as a means of reducing power plant emissions for climate change reasons. For example, in February 2021, EPA prepared a presentation for the White House Climate Advisor. *See* Power Sector Strategy: Climate, Public Health, Environmental Justice, Briefing for Gina

McCarthy and Ali Zaidi (Feb. 4, 2021). Ex.15 (Chang Decl.) ¶¶3-5. While heavily redacted, the document evidences EPA's intent to use its regulatory authority under various programs, including the MATS Rule, for reducing power plant emissions to implement the Administration's climate agenda. *Id.* ¶¶6-7.

Those internal documents match public comments from the EPA Administrator, who repeatedly stated EPA would issue a "suite of rules" designed to close fossil fuel-fired power plants, with the co-benefit of combating climate change. *E.g.*, Geman, *EPA floats path on electricity CO2 emissions with an asterisk*, Axios (Mar. 11, 2022).[8]

As just one example, Administrator Regan said his agency would "couple" climate regulations with "health-based" regulations to regulate greenhouse gases and get around the *West Virginia v. EPA* decision.

> **PBS**: How much of a setback is [the *West Virginia v. EPA* decision] to your efforts to regulate greenhouse gases?
>
> **Regan**: ...We still will be able to regulate climate pollution. And we're going to use all of the tools in our toolbox. ...
>
> **PBS**: Well, can you give us a couple of examples of the kind of tools that you believe you still can use to regulate this industry?
>
> **Regan**: ...We also have a suite of regulations that are facing the power sector. And so, *as we couple the regulation of climate pollution with the regulation of health-based pollution*, we are providing the power

[8] Available at https://www.axios.com/2022/03/11/epa-electricity-co2-emissions.

> sector with a very clear picture of what regulations they're facing so that they can make the right investment decisions.

PBS, *EPA Administrator Michael Regan discusses Supreme Court ruling on climate change*, YouTube (June 30, 2022) (emphasis added);[9] *see also, e.g.*, White House, *Press Gaggle by Principal Deputy Press Secretary Karine Jean-Pierre & Env't Prot. Agency Adm'r Michael Regan* (Feb. 17, 2022) (stating if the Supreme Court limits EPA's ability to regulate greenhouse gas emissions, EPA will respond with "bread-and-butter regulations," such as "regulating mercury").[10]

EPA's public statements and documents evidence this Rule was not promulgated to protect the public from exposure to the regulated HAPs. The purpose for EPA's recent "suite" of rules targeting coal-fired plants is recognized around the world,[11] and courts are "'not required to exhibit a naiveté from which ordinary citizens are free.'" *Dep't of Commerce*, 139 S. Ct. at 2575 (citation omitted).

II. Petitioners Will Suffer Imminent and Irreparable Harm Absent a Stay

A. Petitioner States Will Suffer Irreparable Economic Harm

Petitioner States will suffer irreparable economic harm if the Rule is not stayed during the pendency of litigation.

EPA's claim that the Rule will have almost no impact on electricity prices, 89 Fed.Reg. at 38555-56, does not reflect reasoned decision-making. EPA acknowledges that complying with the Rule will impose millions in costs (presuming plants are able to comply at all). 89 Fed.Reg. at 38561. Those costs must be borne somewhere, and Petitioners have provided declaration after declaration attesting that implementing the Rule will inevitably require prices to increase. Ex.2 (Fedorchak Decl.) ¶¶25-33; Ex.3 (Lane Decl.) ¶23; Ex.7 (Huston Decl.) ¶¶16-17; Ex.8 (Bohrer Decl.) ¶¶18-21; Ex.9 (McLennan Decl.) ¶43; Ex.10 (Tschider Decl.) ¶29; Ex.11 (McCollam Decl.) ¶¶33-35; Ex.16 (Purvis Decl.) ¶11. Any increase in retail electric rates will impose unrecoverable costs on Petitioner States and their residents, including the States as consumers of electricity. *E.g.*, *California v. Azar*, 911 F.3d 558, 581 (9th Cir. 2018) (economic injury sustained by states due federal agency action "is irreparable … because the states will not be able to recover monetary damages").

Moreover, absent a stay of the Final Rule during the pendency of litigation, State regulators will need to expend substantial resources overseeing

implementation of the Final Rule and attempting to mitigate its deleterious effects. Ex.2 (Fedorchak Decl.) ¶7; Ex.3 (Lane Decl.) ¶¶29-31.

B. The Rule's Compliance Costs and Infeasible Standards Risk Catastrophic Consequences for the Power Grid

Even more concerning than the imposition of unrecoverable economic costs, the Rule also threatens irreparable harm by undermining power grid reliability, as power outages are frequently paid for with human lives. *E.g.*, FERC-NERC-Regional Entity Staff Report: The February 2021 Cold Weather Outages in Texas and the South Central United States (Nov. 16, 2021) (over 200 fatalities during weather event "with most of the deaths connected to the power outages").

Although the Rule includes a three-year implementation period, absent a stay during the pendency of litigation, complying with that deadline (or commencing retirement plans if they cannot) requires EGUs to make decisions and take requisite actions *now*. Power plants cannot start and stop instantaneously; actions taken now will be irreversible and will affect power grids for years to come. Ex.8 (Bohrer Decl.) ¶¶24-28; Ex.9 (McLennan Decl.) ¶58; Ex.10 (Tschider Decl.) ¶¶25-30; Ex.11 (McCollam Decl.) ¶¶34-43; Ex.12 (Friez Decl.) ¶¶16-17; Ex.16 (Purvis Decl.) ¶¶15-19. As discussed *supra*, that is precisely what happened the last time the MATS Rule was litigated. Even though the Supreme Court ultimately held EPA acted unreasonably in promulgating the last MATS rule, *Michigan*, 576 U.S. at 743,

regulated EGUs had already been required to spend billions in compliance costs (or begin shutdown operations).

Power plants are again saying this Rule will result in substantial costs and may result in plant closures. Ex.8 (Bohrer Decl.) ¶¶21-24; Ex.9 (McLennan Decl.) ¶¶34-39, 70 ("Recent test data suggest that Minnkota will not be able to meet the New Mercury Limitation even at the higher PAC injection rates that EPA assumed to be sufficient to meet the New Mercury Limitation."); Ex.10 (Tschider Decl.) ¶¶21-23; Ex.11 (McCollam Decl.) ¶¶34-43; Ex.16 (Purvis Decl.) ¶¶24-25 (upgrades to comply "will certainly fail, despite best engineering and maintenance practices, due to the lack of any margin to meet the aggressively low new fPM limitation"). That injury will be irreparable. *Texas v. EPA*, 829 F.3d at 434 (potential closures threatened "the very existence of some of Petitioner's businesses and, even assuming, *arguendo*, that the plant operators could recover their costs from…their consumers, this would not be a recovery made in the course of the litigation").

EPA's perfunctory conclusion this Rule will not affect the power grid at all, 89 Fed.Reg. at 38519, should not be trusted. "EPA has no expertise on grid reliability." *Texas v. EPA,* 829 F.3d at 433. That expertise resides in FERC and NERC, yet EPA did not consult either before finalizing the Rule. Nor does EPA's Regulatory Impact Analysis reflect a long-term assessment of grid reliability, despite receiving comment after comment that the Rule would have significant impacts on

the power grid. *See* RIA at 3-23 3-24. And EPA's feasibility determinations are supported almost entirely by a single comment that is woefully inadequate to support EPA's conclusions. *See* Ex.13 (Holmes Decl.) ¶11 (summarizing EPA's reliance on the Andover Report as "bootstrapping at its worst").[12] State and grid regulators attest the foreseeable impacts of this Rule on power grid reliability will be significant. Ex.1 (Vigesaa Decl.) ¶¶11-26; Ex.2 (Fedorchak Decl.) ¶¶7-24; Ex.3 (Lane Decl.) ¶¶18-34; Ex.4 (Rickerson Decl.) ¶¶13-15; Ex.5 (Nowakowski Decl.) ¶¶7-12; Ex.6 (Webb Decl.) ¶¶6-10; Ex.7 (Huston Decl.) ¶12.

In a telling section, EPA dismisses widespread concerns about the Rule's foreseeable impact on power grid reliability by assuming that State or regional regulators will be able to use emergency powers to prop up the power grid if the Final Rule makes EGUs no longer commercially viable. 89 Fed.Reg. at 38526. EPA's reliance on such emergency, stopgap powers to prevent the Rule from breaking the power grids is the epitome of arbitrary and capricious agency action.

According to a study commissioned by the North Dakota Transmission Authority, if the Rule causes any of North Dakota's lignite-fired EGUs to retire, it will risk causing the entire MISO grid to experience black-outs resulting in economic damages ranging from $29 million to over $1 billion. Ex.1 (Vigesaa Decl.) ¶¶22-

[12] Further, an author of one of the few other studies EPA relies upon for its feasibility determination attests EPA is also misusing that study. Ex.14 (Benson Decl.) ¶¶6-8.

25. Given that the Rule will likely have the effect if not the deliberate goal of setting HAP emission standards that coal-fired EGUs in North Dakota and elsewhere will be unable to comply with, undermining long-term grid reliability is a foreseeable impact of the Rule that EPA failed to take seriously.

Furthermore, as noted *supra*, EPA's conclusion the Rule will have no impact on power plant operations should be viewed with skepticism given EPA's history of woefully underestimating the impact that its rules—and the MATS Rule specifically—will have on power plant operations. The last time EPA promulgated the MATS Rule, its claim that it would impact only about 5,000 MW of power ended up being wrong by over a factor of ten. The power grids today do not have the same buffer of dispatchable power that they had a decade ago, and an error on the same magnitude as EPA's last profound error would likely have catastrophic results. Ex.1 (Vigesaa Decl.) ¶11-12; Ex.3 (Lane Decl.) ¶¶12-13; Ex.7 (Huston Decl.) ¶¶8-14.

In similar circumstances, the Fifth Circuit stayed an EPA rule that a state plausibly alleged would result in grid instability due to the likely closure of coal-fired power plants during the pendency of litigation. *Texas v. EPA*, 829 F.3d at 434. In that case, Texas argued that the changes mandated by the challenged rule would cost power plants upwards of "$2 billion, rendering them uneconomical and forcing the plants to close" potentially "remov[ing] 3,000 MW to 8,400 MW of generating

capacity." *Id.* at 416. Consequently, the court held that "the threat of grid instability and potential brownouts alone constitute irreparable injury." *Id.*

III. The Balance of Harms and the Public Interest Favor a Stay

Staying the Rule while Petitioners' challenge is heard on the merits will maintain the status quo, and EPA acknowledges the status quo already protects public health. 89 Fed.Reg. at 38508 (existing standards already provide an "ample margin of safety").

The public interest also favors a stay when that rule would potentially threaten the public's access to affordable electricity. *Texas v. EPA*, 829 F.3d at 435 (granting stay where "public interest in ready access to affordable electricity" outweighed "inconsequential" emissions reductions that rule implementation would have achieved during the pendency of the litigation); *see also, e.g., Sierra Club v. Ga. Power Co.*, 180 F.3d 1309, 1311 (11th Cir. 1999) (denying preliminary injunction where it threatened to reduce power generation, as "[a] steady supply of electricity ... especially ... [for] the elderly, hospitals and day care centers, is critical."); *West Virginia v. EPA*, 90 F.4th 323, 332 (4th Cir. 2024) ("the public [] has an interest in the efficient production of electricity and other industrial activity in the State, even as such production is balanced with environmental needs").

And courts have found "unconvincing" the suggestion that the public will be injured from a stay pending litigation where, as here, complying with the rule "would

not reduce emissions for at least three years." *Texas v. EPA*, 829 F.3d at 434. That is particularly the case where, as here, the existing conditions already far exceed federal safety or environmental goals. *Id.* at 434–35.

CONCLUSION

Petitioners ask the Court to stay implementation of the Final Rule.

Respectfully submitted,

DREW H. WRIGLEY
Attorney General

EXHIBIT 8

Declaration of Penny E. Lassiter

***Blue Ridge Environmental Defense League v. Regan*,**
No. 22-03134 (D.D.C.)

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

BLUE RIDGE ENVIRONMENTAL DEFENSE LEAGUE, *et al.*,	)	
Plaintiffs,	)	
v.	)	Case No. 1:22-cv-03134
MICHAEL S. REGAN, in his official capacity as Administrator of the U.S. Environmental Protection Agency,	)	Hon. Amit P. Mehta
Defendant.	)	

DECLARATION OF PENNY E. LASSITER

1. I, Penny E. Lassiter, under penalty of perjury, affirm and declare that the following statements are true and correct to the best of my knowledge and belief and are based on my personal knowledge or on information contained in the records of the United States Environmental Protection Agency ("EPA") or supplied to me by EPA employees under my supervision.

2. I am the Director of the Sector Policies and Programs Division ("SPPD") within the Office of Air Quality Planning and Standards ("OAQPS"), Office of Air and Radiation ("OAR") at EPA. I have held this position in a permanent capacity since May 26, 2019. SPPD is the division within OAQPS that has responsibility for developing, reviewing, and revising, as required and appropriate, regulations under section 112 of the Clean Air Act ("CAA"), 42 U.S.C. § 7412, the National

Emission Standards for Hazardous Air Pollutants ("NESHAP") program, including regulations relevant to hazardous waste combustion.

3. As Director of SPPD, I am responsible for overseeing EPA's promulgation of regulations under the NESHAP and other CAA programs. From my longstanding experience, including 26 years of leadership in SPPD and its predecessor division with similar regulatory development responsibilities, I am very familiar with the processes required in developing and promulgating major EPA regulations under the CAA and the time periods allotted for EPA to take regulatory actions thereunder, including issuing rules pursuant to CAA sections 112(f)(2)(A) and 112(d)(6), 42 U.S.C. §§ 7412(f)(2)(A) and 7412(d)(6), respectively. I have also relied upon my staff to provide the factual information concerning the regulatory steps and schedule needed for the particular CAA section 112, 42 U.S.C. § 7412, actions at issue in the case for which I make this declaration.

4. At this time, the earliest possible completion date for a final rule making for the National Emission Standards for Hazardous Air Pollutants from Hazardous Waste Combustors (HWC NESHAP) is August 14, 2026. The dates for the rule making phases described in my July 27, 2023, declaration are updated as follows to reflect events since that time; asterisks indicate where time was removed from the phase in comparison to the July 27, 2023, declaration and why:

Phases from July 27, 2023 Declaration	**Completion or Estimated Completion Date**
Phase I. Project Kickoff	Completed June 2023
Phase II. Preliminary Information Collection	Completed July 2023
Phase III. Supplemental Information Collection and Outreach to Stakeholders	November 22, 2024 (1 month)
Phase IV. Data Analyses and Modeling File Development	December 30, 2024 (1 month)
Phase V. Residual Risk Analysis and Technology Review	April 29, 2025 (4 months)
Phase VI. Development and Completion of Proposed Rule	October 24, 2025 (6 months) * Two months of exclusive OMB time removed
Phase VII. Proposed Rule Publication and Comment Period	January 22, 2026 (3 months)
Phase VIII. Summarization of Comments, Development of Comment Responses and Analysis of Data	March 23, 2026 (2 months)
Phase IX. Development and Completion of Final Rule	August 14, 2026 (5 months) * Remaining two months of exclusive OMB time removed

5. Analysis of title V permits during Phase II showed that some hazardous waste combustors have emissions limits for hazardous air pollutants (HAPs) that are not currently regulated in the HWC NESHAP, including polychlorinated biphenyls (PCBs). Other HAPs or HAP precursors of potential interest at that time

included fluorinated compounds, brominated compounds, polycyclic aromatic hydrocarbons (PAHs), hydrogen cyanide (HCN), and asbestos.

6. My staff therefore issued the "first survey" to nine entities seeking information that was needed to identify the actual additional HAPs or HAP precursors that should be regulated. To expedite the rulemaking process, we chose to survey nine entities that own or operate hazardous waste combustors. Together, these nine entities are representative of the six distinct HWC NESHAP subcategories. If EPA surveys more than nine entities, it must do so through a formal information collection request issued pursuant to the Paperwork Reduction Act. It can take over a year to issue such a request to recipients because it must be developed though public notice and comment and must be approved by the White House's Office of Management and Budget.

7. The first survey was issued on August 17, 2023, and the initial response deadline was October 31, 2023. Due to multiple requests for an extension, we extended the deadline to November 15, 2023. Copies of all responses with confidential business information removed are publicly available at http://www.regulations.gov (Docket ID EPA-HQ-OAR-2004-0022).

8. Based on the responses to the first survey, in Phase III my staff issued the "second survey" of the information collection request, which was an emissions testing request. EPA requested testing of 23 HWCs owned or operated by 9 entities

and targeted four HAPs and one potential HAP surrogate: PCBs, polycyclic aromatic hydrocarbons (PAHs, a class of organic HAPs), hydrogen fluoride (HF), hydrogen cyanide (HCN), and hydrogen bromide (HBr). While HBr itself is not a HAP, it can potentially serve as a surrogate for the release of brominated HAP emissions. Because responses to the first survey indicated that some hazardous waste combustors do not combust the chemical components required to form some of the HAPs, testing requirements in the second survey were tailored to each survey recipient.

9. The initial deadline for providing emission test results in response to the second survey was August 30, 2024. Some companies asked for and were granted deadline extensions for operational reasons (*i.e.*, their combustors were undergoing maintenance and were not operational during the expected testing window). In August 2024, multiple companies contacted EPA and asked for emissions testing extensions due to delays at a third-party laboratory, Eurofins Environment Testing - Knoxville. That laboratory is one of three that, to our knowledge, can process the required samples nationwide. EPA contacted the laboratory, which confirmed a significant delay in sample processing. Because companies had completed their tests in a timely manner but had not yet received their results for reasons beyond their control, EPA extended the emissions testing deadline to September 29, 2024.

In September 2024, because EPA learned that some laboratory results had still not been returned, EPA extended select deadlines until October 31, 2024.

10. On October 30, 2024, one entity requested an extension to November 22, 2024, because they received their final analytical results from the laboratory on October 23, 2024. This data must still undergo review by the facility and appropriate data entry so that the company can use the data to calculate the emission results to respond to the second survey. EPA believes that this timeline is reasonable and granted this request.

11. As of November 1, 2024, EPA has received 19 of 23 emissions testing responses, or 83%, from 7 of 9 entities. We expect to receive results from one of the two remaining entities by November 22, 2024. We do not expect another extension request from this entity because the entity, which is submitting results for three liquid fuel boilers, is no longer waiting on analytical results.

12. EPA has received no test results from the last remaining entity, Norlite, LLC, which suspended operations of their HWCs in March 2024 before testing could be conducted and has not restarted. As described in paragraphs 7 through 9 of my declaration dated September 15, 2023, EPA must obtain emissions testing data in order to develop emissions limits for currently unregulated HAPs. Since Norlite, LLC operates the only hazardous waste burning lightweight aggregate

kilns in the country (one of the six distinct HWC NESHAP subcategories), we will move forward with the RTR rulemaking process with the currently regulated HAPs for lightweight aggregate kilns and require the emissions testing for this subcategory for the currently unregulated HAPs if and when the facility restarts operations.

13. Because we are missing data from only two of the six distinct HWC NESHAP subcategories (liquid fuel boilers and lightweight aggregate kilns), we are proceeding with the rulemaking process for unregulated HAPs for the other four subcategories in the interim. We are also proceeding with the rulemaking process for regulated HAPs from all six HWC NESHAP subcategories. EPA collected available data for regulated HAPs during Phase II of the rulemaking; the second survey was specific to unregulated HAPs.

14. To the extent possible, EPA already is conducting Phase IV by organizing and analyzing data that we have collected. Most of the information collected in Phase II was in PDF format, which cannot be used directly in calculations. We have been extracting that data into a usable format and expect to complete that process in November 2024, facilitating completion of Phase IV in December 2024.

Executed this 4th day of November 2024.

Heather E. Gange

EXHIBIT 9

Declaration of Panagiotis E. Tsirigotis

***Sierra Club v. Pruitt*, No. 16-02461 (D.D.C.)**

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

BLUE RIDGE ENVIRONMENTAL DEFENSE LEAGUE, *et al.*, *Plaintiffs*, v. SCOTT PRUITT, Administrator, United States Environmental Protection Agency, *Defendant.*	Civil Action 1:16-CV-00364-CRC
CALIFORNIA COMMUNITIES AGAINST TOXICS, *et al.*, *Plaintiffs*, v. SCOTT PRUITT, Administrator, United States Environmental Protection Agency, *Defendant.*	Civil Action 1:15-CV-00512-TSC

CORRECTED DECLARATION OF PANAGIOTIS E. TSIRIGOTIS

1. I, Panagiotis E. Tsirigotis, under penalty of perjury, affirm and declare that the following statements are true and correct to the best of my knowledge and belief and are based on my own personal knowledge or on

information contained in the records of the United States Environmental Protection Agency (EPA) or supplied to me by EPA employees under my supervision.

2. I am the Director of the Sector Policies and Programs Division (SPPD) within the Office of Air Quality Planning and Standards (OAQPS), Office of Air and Radiation (OAR) at EPA, a position I have held since February 6, 2006. SPPD is the division within OAQPS that has responsibility for, among other things, developing regulations, policy, and guidance associated with section 112 of the Clean Air Act (CAA), 42 U.S.C. § 7412, which is the national emission standards for hazardous air pollutants (NESHAP) program.

A. Responses to Questions Raised by the Court

3. At the hearing held on February 2, 2017, Judge Cooper requested a declaration from EPA providing additional information concerning the resources available to SPPD, including: (1) How many employees are part of SPPD; (2) How many employees in SPPD work on the risk and technology reviews (RTRs); (3) What are the other responsibilities of SPPD; (4) On what discretionary projects does SPPD work; and (5) To what extent can SPPD call on other Agency resources to complete RTR actions? Judge Cooper subsequently issued an order requiring EPA to submit such a declaration and giving Plaintiffs an opportunity to respond. This declaration is EPA's response to that order.

ED_021114_00003489-00110

4. SPPD is the division of EPA responsible for coordinating efforts of the multiple divisions and offices within EPA that support the RTR program, and SPPD also is responsible for conducting information collection, performing many of the required technical analyses, and drafting the regulatory package and much of the supporting documentation for RTRs. An SPPD staff member serves as the project lead for all RTRs. As discussed in my earlier declaration, the project lead relies on the technical expertise of other SPPD staff as well as staff from other EPA divisions and offices, as well as contractors, to complete the technical analyses and prepare the regulatory package. Other EPA offices, such as the Office of Research and Development, Office of Policy, and the Office of General Counsel, participate in workgroups for each RTR project. Workgroup members provide expertise including technical (such as risk assessment and monitoring), legal (both defensibility and enforceability), and economics. Overall, the projects require considerable coordination, communication, and technical expertise. SPPD currently has 87 employees, 79 of whom work on RTRs (which are described in detail in my previous declaration) in some capacity. Forty-two of the 79 employees are either project leads or project assistants who conduct the day-to-day project activities involved with conducting the required reviews and developing regulations, as necessary. These same staff also serve as the project leads and assistants for SPPD's other CAA-mandated regulatory work, which altogether

(including the RTRs) results in a total of about 250 regulations subject to periodic review requirements. In addition to the project leads and assistants, there are 6 managers who report directly to me and manage staff, including the project leads and assistants, on multiple projects required under the CAA, including RTRs, as described in paragraphs 5 through 11 below. There also is a group of 6 policy/program development specialists including a manager who have multiple responsibilities related to RTRs and other regulatory projects, including: reviewing all regulatory packages; providing up-to-date guidance materials to staff; supporting litigation activities including the development of legal briefs; developing schedules and tracking progress; coordinating with other EPA offices; identifying regulatory priorities; and developing and implementing policies regarding technical issues in order to ensure that SPPD's rules are consistent with statutory requirements and internally consistent. SPPD also includes a group of 10 staff, including a manager, responsible for monitoring/recordkeeping and reporting. This group develops monitoring requirements for RTRs and other rules, reviews emissions test reports that are used in RTRs and other rules, and develops electronic systems for submittal of emissions data and other information by entities subject to RTRs and other rules. I also manage 7 additional staff, in my division front office, who provide support with budgeting, planning, training, and oversight of SPPD's regulatory programs. Three staff are communication specialists who are

responsible for preparing briefings and providing technical editing support for RTRs and other work products produced by SPPD. Four staff are administrative support, who provide administrative support for all of the work in SPPD, including editing of regulatory packages, setting up meetings, setting up travel, timekeeping, and word processing. Overall, I estimate that the equivalent of 38 full-time staff work on RTRs. For the remainder of this declaration, I use the term full-time equivalents or FTEs to indicate the estimates of how many staff are dedicated to particular responsibilities. As described in paragraphs 6 through 11, SPPD's responsibilities include many other types of regulations and reviews, and the statutory requirements simply cannot be met given the size of the organization. I note that a typical regulatory project requires up to 3 FTEs within SPPD, along with contractor support, and each of the project leads and assistants typically are assigned to multiple projects.

5. RTRs are a significant part of our current work. These reviews must be conducted for all source categories that are subject to maximum achievable control technology (MACT) standards and all section 129 solid waste incinerator rules. There are approximately 120 categories subject to this requirement. We have completed the RTRs for almost 60 of the categories, and RTRs for about 50 additional categories are overdue or will be due soon.

6. As described in the following paragraphs, SPPD is also primarily responsible for developing and reviewing federal air regulations that apply to stationary sources of air pollution under CAA sections 111, 112, and 129.

7. CAA section 111(b) requires EPA to promulgate standards for certain pollutants. These standards, which apply to new sources, are known as new source performance standards (NSPS). EPA also is required to review and, if appropriate, revise each NSPS every 8 years. There are about 70 NSPS that are subject to this ongoing requirement. These projects typically require a comprehensive review of the source category which includes determining whether substantive changes or improvements to the standards are needed. An estimated 11 staff in SPPD (full-time equivalents) work on the review and revision of NSPS, but significantly more staff would be needed to conduct all of the statutorily required reviews. SPPD continues to prioritize and conduct these reviews as staff and contractor resources allow.

8. Under CAA section 112, EPA is required to identify and list categories of stationary sources that emit any of the 187 hazardous air pollutants (HAP) listed in CAA section 112(b)(1) (or any HAP subsequently added by EPA) and then to develop national emission standards for hazardous air pollutants (NESHAP), for those source categories by specified statutory deadlines. These actions are largely completed, although several NESHAP are still in litigation and

several others have been vacated or remanded by the court of appeals. An estimated 15 staff in SPPD (full-time equivalents) are working on NESHAP (not including RTRs). The NESHAP that apply to major stationary sources of HAP emissions, along with a subset of NESHAP that apply to smaller area sources of HAP emissions, are referred to as MACT standards, and EPA is required to perform the RTR review for all MACT standards as mentioned in paragraph 5. The other NESHAP, which apply to most of the categories of "area" or non-major sources, are referred to as generally available control standards (GACT) and these standards are subject only to the CAA section 112(d)(6) technology review and not to the CAA section 112(f)(2) risk review, as described in paragraph 9.

9. There are about 60 source categories that are only subject to the CAA section 112(d)(6) technology review requirement. The original rules for these source categories were mostly promulgated between 2007 and 2009. To date, EPA has prioritized conducting the technology reviews for those source categories that are also subject to the residual risk review requirement.

10. SPPD is responsible for developing standards under CAA section 129 for solid waste incinerators. SPPD has already promulgated most of the statutorily required rules, although several are subject to ongoing litigation. SPPD is also responsible for promulgating federal plans associated with the section 129 standards. An estimated 4 staff in SPPD (full-time equivalents) work on aspects of

ED_021114_00003489-00115

the section 129 standards. As noted above, all section 129 rules are subject to the requirement to conduct risk reviews of the technology based standards. These rules are also subject to a technology review requirement although under section 129 such reviews are required at 5 year intervals. The staff resources devoted to the review of the section 129 rules are included in the resources we have identified for the RTRs generally.

11. Other activities performed by SPPD include: (1) Developing existing source performance standards under CAA section 111(d); (2) Reviewing and revising (if necessary) emissions factors used for estimating emissions of volatile organic compounds, carbon monoxide and oxides of nitrogen every 3 years as required under section 130 of the CAA; (3) Responding to petitions to add and remove HAPs from the list in CAA section 112(b) of the CAA and major sources from the list in CAA section 112(c); and (4) Periodically reviewing volatile organic compound rules and Control Techniques Guidelines developed under CAA section 183(e).

12. In addition to reviewing, revising and developing regulations and performing other statutorily prescribed actions as described above, SPPD provides programmatic support for these actions. While these activities are not specifically mandated by the statute, SPPD believes they are necessary to support issuance and implementation of the actions that are prescribed by the statute. These activities

include providing technical expertise and other support for litigation on the rules developed by SPPD; responding to Freedom of Information Act requests; responding to Congressional inquiries; providing technical expertise and guidance to resolve issues concerning implementation of rules developed by SPPD; optimizing and updating procedures and systems used to develop rules and improved efficiency, including quality assurance tools for large data files, comment summary systems, guidance development, and electronic data submittal systems, such as systems for stationary sources to submit emissions data; performing stakeholder outreach, including webinars, other presentations, hotlines, and face-to-face meetings to communicate the requirements of new regulations; and supporting activities, undertaken by other parts of EPA, to implement the rules written by SPPD. These types of activities are performed by most of the technical staff in SPPD as part of their general duties concerning rules and actions for which they are responsible or part of a team. Overall, an estimated 19 SPPD staff (full-time equivalents) work on these other projects and activities.

13. In addition to the activities described above that are prescribed by the statute or that are related to actions prescribed by the statute, SPPD does perform discretionary actions. Historically, most of SPPD's work involves developing, implementing and reviewing statutorily required regulations. The discretionary items that SPPD generally undertakes include many of the types of activities that

ED_021114_00003489-00117

are expected of high performing organizations that are focused on serving clients. Some examples include:

- Professional development of SPPD staff;
- Attendance at technical conferences;
- Development of databases and information technology systems for enabling transparency and access to information related to our programs.

These types of activities constitute a small percentage of SPPD's work that is difficult to estimate but is not appreciable.

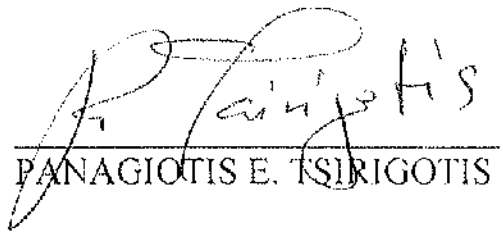
14. Administration priorities also can result in SPPD being tasked with certain additional activities that are not required by statute, including development of regulations. Over the past five years, SPPD has expended significant resources on one such action, the Clean Power Plan. Because the Clean Power Plan was developed under the authority of CAA section 111, the administration tasked SPPD with managing the rulemaking process for the plan, the development of which relied on resources from many offices across the agency. The rule was finalized in 2015 and the staff who worked on that rule have now been assigned to work on other projects as described in paragraphs 5 thru 11 above.

15. In developing RTR actions, SPPD relies on resources in other parts of the agency, as well as contractor resources, to ensure that we engage individuals

ED_021114_00003489-00118

with the needed expertise to resolve the multitude of issues that may arise. As described above and in my earlier declaration, development of an RTR rulemaking requires the involvement of numerous individuals with different skill sets. The schedule provided in my previous declaration to this court includes leveraging available resources from outside of SPPD to assist with various issues and to serve on the project workgroups, which are described in my earlier declaration. Most critically, the Health and Environmental Impacts Division (HEID) within OAQPS also has significant responsibilities related to the RTR projects. The risk assessments described in my earlier declaration are conducted by HEID's Air Toxics Assessment Group, and economic analyses are conducted by HEID's Air Economics Group. Overall, 9 HEID staff work on RTR projects. Of these, about 6 HEID staff (full-time equivalents) scientists and engineers serve as risk assessment leads, and 3 HEID staff (full-time equivalents) serve as lead economists. In recent years, HEID has conducted day-to-day risk and economic project activities for between 8 and 11 RTR source categories per year. This level of support is near HEID's capacity to provide such support. Other workgroup members include staff from: (1) the Office of General Counsel, who provide legal advice and review; (2) the Office of Research Development, who provide additional technical support, evaluate health benchmark information for various pollutants, and help ensure consistency with other Agency actions; (3) the Office of Policy, who evaluate

ED_021114_00003489-00119



consistency across EPA programs and coordinate review with the Office of Management and Budget; (4) the Office of Enforcement and Compliance Assurance, who help to ensure that rules are written in a manner than can be easily understood and implemented; and (5) regional offices who have direct experience with the industrial facilities being regulated. We also make full use of all available contract resources when conducting RTR projects. Contractors provide support in many ways, including conducting technical analyses, drafting technical memoranda explaining those analyses, summarizing comments, and other non-decisional aspects of rulemaking.

16. SPPD leverages resources from other parts of the Agency as explained above; however, the division generally cannot rely on other staff within the Agency or on contractors to perform the tasks currently performed by SPPD staff. As noted, SPPD is a division within the Office of Air Quality and Planning Standards (OAQPS), which is part of the Office of Air and Radiation (OAR). The Office of Air and Radiation is responsible for implementing the CAA. Each of the offices with OAR is responsible for implementing specific CAA programs and many of those programs are subject to statutory deadlines. Even assuming those offices have resources devoted to activities that could be considered discretionary, the staff do not have expertise that would allow them to step into the shoes of the

experts in SPPD with little to no training. The offices outside OAQPS include staff with expertise in significantly different programs, such as mobile sources and stratospheric ozone protection. Even within OAQPS, the other offices typically have significantly different expertise, such as developing national ambient air quality standards (NAAQS) and working with states on developing plans to meet the NAAQS. The staff responsible for RTR rulemaking are doing a specialized job that requires specialized training and experience. An environmental engineering or environmental science background, along with expertise in the industrial sectors being regulated are necessary in order to effectively lead RTR projects. It also is important to note that contractors cannot perform any "inherently governmental" tasks, such as selecting regulatory options and establishing policy, associated with RTR rulemaking. Finally, the time that is needed to conduct the individual tasks cannot be shortened by the addition of more staff or contractor resources in many instances. For example, the length of the public comment period is prescribed by the statute; the time to perform the risk modeling is dependent on technical constraints; and the time to collect data from industry is dependent on limitations of the individual companies, including the time it takes to perform testing, if required.

17. In summary, due to SPPD's considerable workload, the available staff, and budgetary constraints, SPPD must prioritize work, and it is usually the case that the available resources are insufficient to allow all of the required work to be completed in a timely fashion.

SO DECLARED:

PANAGIOTIS E. TSIRIGOTIS

Subject: Presidential Exemption: HON Rule: Nouryon Functional Chemicals LLC
13440 US-43 North, Axis, AL 36505

To Whom It May Concern:

Nouryon Functional Chemicals LLC (Nouryon) requests an extension of the compliance period as follows:

- Emission Standard/Limitations:
  - 40 CFR 63.670(i) – This part of the rule requires that the owner or operator of a flare shall install, operate, calibrate, and maintain a monitoring system capable of continuously measuring, calculating, and recording the volumetric flow rate in the flare header or headers that feed the flare as well as any flare supplemental gas used.
  - 40 CFR 63.670(j) – This part of the rule requires the owner or operator monitor the net heating value
- Facility: Nouryon Functional Chemicals LLC
- Equipment: Flare
- Length of compliance period extension requested: two years (July 15, 2027 to July 15, 2029)
- Justification:
  - Due to the harsh nature of the vent gas going to the flare, Nouryon requests an extension of the compliance period to identify monitoring equipment that can withstand the harsh nature of the vent gases being handled, in a reliable manner that would not cause an increase in emissions due to the increased shutdowns for repair/replacement/modification.

- Granting the extension is in the national security interest of the United States as production of carbon disulfide at the facility may be negatively impacted. Nouryon is a major producer of carbon disulfide, which is a vital raw material in the production of other chemicals used in various industries.

If you require any additional information, please contact me at 406.902.9019 or via email at Michael.mitchell@nouryon.com.

To whom it may concern,

I wonder if you would please help my company out with a problem.

Our name, Long Island Sterilization, located in Hauppauge, NY was not listed on the recent announcement from the White House announcement regarding a two year extension on the NESHAP rules.

As you can see below, we had submitted our request at the appropriate time.

Thank you very much, if you have any questions that you need answers for please contact me directly?

Sincerely,

Ray

Subject: Presidential Exemption: Ethylene Oxide Emissions Standards for Sterilization Facilities: National Emission Standards for Hazardous Air Pollutants (NESHAP) : Long Island Sterilization
Importance: High

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To whom it may concern,

We are requesting a Presidential Exemption for Ethylene Oxide Emissions Standards for Sterilization Facilities: **National Emission Standards for Hazardous Air Pollutants (NESHAP)**.

This would be for our ETO sterilizing facility: Long Island Sterilization.

Long Island Sterilization has common ownership with our medical device manufacturing company, Robert Busse & Co. dba Busse Hospital Disposables.

Busse Hospital Disposables (Busse) is a small woman owned company located in the Hauppauge Industrial Park located in Hauppauge, NY. our facilities are located two blocks from each other.

Busse Hospital Disposables is in direct control of Long Island Sterilization (LIS) , we have been sterilizing medical devices for over 26 years.

We are currently operating under a permit from the New York DEC. We have applied for an extension for our permit to take us into next year.

We are currently in full compliance with NYS DEC regulations but will need to start upgrading our sterilization facility to be incompliance with the NESHAP rules.

Busse Hospital Disposables & LIS injection mold, assemble, package and sterilize over 18 million medical products / yr.

Busse has been in operation as a manufacturer for over 45 years and in business for over 60 years.

We currently have 260 full time employees.

Our products are used throughout the entire healthcare spectrum from Hospitals to Ambulatory Centers, Doctors offices and nursing homes

We currently have a Federal Supply Schedule contract with VA Health system.

Most of the sales of our products are done through our distributors such as Cardinal Health, Medline Industries, Henry Schein, McKesson Medical, Owens & Minor and over 100 local and regional distributors.

We also export our medical devices overseas.

Along with a full line of single use, procedural kits & trays, surgical drapes and OR suction products under the Busse brand, we also manufacture private branded products for many well-known companies in the US.

We also manufacture OEM parts to other medical device manufacturers for use in their sterile procedural kits, trays & surgical packs.

We are requesting a period of at least two years to become compliant with the new NESHAP regulations. We are asking this because:

1) We feel the necessary upgrades to our existing equipment along with new construction in our facility will be quite costly for our company.

2) There will also be a required purchase of additional monitoring equipment. This will be a very large capital expense for us and most be done in stages for cash flow as well as staying in successful day to day operation as a business. The technology exists but is not inexpensive.

One of the bullet points you ask us to include was explanation as to why this extension "is in the national security interest of the United States".

I believe the best we can say is simply that we manufacture and sell at an average over 18 million sterile medical devices annually. 98% are sold to be used in the United Sates.

Lastly, many of our products are used during lifesaving surgeries as well as being used in the normal Emergency Room's and physician's offices throughout the United States.

I hope that we have answered your questions to your satisfaction and hope you can help us by including us in this program.

If you need any additional information or would like to visit our two facilities just let me know.

Sincerely,

Ray

Hello,

I'm following up to check on the status of the application for the Presidential Exemption: NESHAP – EtO Emissions Standards for Sterilization Facilities.

I've been made aware that some other companies specializing in medical equipment sterilization with EtO have been granted an extension. Could you let me know if our application is still under review, or if it has been denied?

Any information you can provide would be greatly appreciated.

Thank you,
Amanda

Message

From: Lori Carson [Lori.Carson@zeonchemicals.com]
Sent: 4/9/2025 6:10:51 PM
To: AirAction [AirAction@epa.gov]
Subject: Presidential Exemption: HON rule: Zeon Chemicals Kentucky Plant and Zeon Chemicals Mississippi Plant

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

I respectfully request a 2-year Presidential Exemption from the HON Rule for Zeon Chemicals LP's Louisville, Kentucky plant and Hattiesburg, Mississippi Plant.

Emissions standards or limitations subject to the request
The HON rule (see below) requires facilities subject to the Polymer & Resins I NESHAP to conduct extensive fence line monitoring of facilities for certain air pollutants. The cost of fence line monitoring has been estimated at more than $50,000 per year for our Kentucky Plant which emits less than one ton of the covered chemical per year. The cost of fence line monitoring has been estimated at more than $600,000 per year for our Mississippi Plant which emits 2 pounds or less of the covered chemical per year.

"New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins" (89 FR 42932; May 16, 2024) (HON rule)

Facility(ies) and/or affected source(s)

Zeon Chemicals Kentucky Plant in Louisville, KY
Zeon Chemicals Mississippi Plant in Hattiesburg, MS.

Length of compliance period being requested.

2 years.

Provide a justification to support the request

The requested extension is in the national security interests of the United States. Zeon Chemicals LP produces a domestic supply of elastomers. Our elastomers are used to make parts that are used in vehicles including farming equipment and military vehicles. Our Kentucky Plant makes a base rubber that is used to make components for petroleum extraction and refining equipment. The HON Rule's provisions threaten our ability to remain competitive in our industry. This could impact supply chain resilience and defense/military preparedness. Having domestic supply of parts made from this critical raw material avoids any supply chain interruptions to US industries and military forces due to geopolitical tensions, trade disruptions, natural disasters or other crises. It also ensures that national defense and essential US industrial sectors remain operational. Our elastomer is a critical material for seals, belts and other components of military equipment. Having a domestic supply guarantees the readiness of the armed forces in times of conflict. Similarly, components of petroleum extraction and refining processes made from elastomers allow the industry to maintain operational continuity which is vital for fueling military operations and civilian infrastructure.

Subject: RE: Presidential Exemption: HON Rule (89 FR 42932; May 16, 2024): INEOS Americas LLC – Bayport EO Plant (INEOS)

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To Whom It May Concern:

The purpose of this email is to followup on the initial email sent on March 31, 2025 requesting a Presidential Exemption from the HON Rule for the INEOS Americas LLC – Bayport EO Plant.

What is the timeline for responding to the INEOS Presidential Exemption request?

INOES is available to answer any questions or provide additional information as needed to facilitate your review of the request.

Finally, is there a single point of contact that INEOS can contact in the event that INEOS has questions?

Thank you in advance for your review and consideration of this matter.

Please don't hesitate to contact me with questions.

Thank you,
Robert Vogel

From: Vogel, Robert <robert.vogel@ineos.com>
Sent: Monday, March 31, 2025 6:22 PM
To: AirAction <AirAction@epa.gov>
Subject: Presidential Exemption: HON Rule (89 FR 42932; May 16, 2024): INEOS Americas LLC – Bayport EO Plant (INEOS)

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To Whom It May Concern:

Please find attached the required information to request a Presidential Exemption under section 112(i)(4) of the Clean Air Act for compliance with the HON Rule (89 FR 42932; May 16, 2024) for the emission standards and limitations referenced in this correspondence for the INEOS Americas LLC – Bayport EO Plant (INEOS).

Emissions standards or limitations subject to the request:

The emissions standards or limitations subject to the Presidential Exemption request by INEOS are contained in the National Emission Standards for Hazardous Air Pollutants (NESHAP) for three subparts in 40 CFR 63 (subparts F, G, and H) that apply to the Synthetic Organic Chemical Manufacturing Industry (SOCMI) and for one subpart in 40 CFR 63 (subpart I) that applies to equipment leaks from certain non-SOCMI processes located at chemical plants. These four NESHAP are more commonly referred together as the Hazardous Organic NESHAP (HON) (89 FR 42932; May 16, 2024) (HON rule).

The specific emission standards or limitations subject to this request are as follows:

- Process Vents in both ethylene oxide and non-ethylene oxide HAP service;
- Wastewater Streams in ethylene oxide service;
- Fenceline Monitoring for ethylene oxide and vinyl chloride;
- Process relief devices (PRD) in both ethylene oxide and non-ethylene oxide HAP service; and
- Leak Detection and Repair (LDAR) requirements in ethylene oxide service.

Facility(ies) and/or affected source(s):

The facility for which the Presidential Exemption request is being made is the INEOS Americas LLC – Bayport EO Plant located at 5761 Underwood Road in Pasadena, Texas 77507.

Length of compliance period being requested:

The length of the compliance period extension request is as follows:

- The length of the extension being requested is for two years from the July 15, 2026 compliance date to July 15, 2028 for the ethylene oxide standards or limitations specified in the preceding section.
- The length of the extension being requested is for two years from the July 15, 2027 compliance date to July 15, 2029 for the non-ethylene oxide standards or limitations specified in the preceding section.

Justification to support the request:

The justification supporting this request for the extension is that the technological and technical issues for each emission standard or limitation is as follows:

Process Vents to Regenerative Thermal Oxidizer (RTO) – There are technological and technical concerns with the site RTO. The site RTO has been overdesigned to allow additional streams to be added in compliance with the HON. However, each stream requires a process hazard review (temperature, pressure, vapor saturation) to determine if the RTO is an appropriate solution. Even with this individual stream evaluation showing a favorable result, further hazard assessments are required to ensure interactions (reaction, process stability, system pressure) between streams converging to the current RTO can be done safely. This detailed process hazard review is a required step to ensure the site not only meets the requirements of the legislation but also the process safety hazards associated with the handling of potentially highly reactive chemicals from these various streams. Project construction will take an additional 18 months to complete once engineering has been completed.

Fenceline Monitoring – A root cause analysis must be completed and corrective actions implemented when the annual average delta concentration value for ethylene oxide is greater than 0.2 µg/m3 on an annual average basis. There are technology concerns with being able to detect

concentrations of EO at the currently proposed threshold limits. This will make it very difficult to determine the source of the ethylene oxide emissions much less mitigate the emissions. The action levels are so low that the technology may not exist for mitigating the ethylene oxide emissions based on the EPA's IRIS value. The EPA's IRIS value, which was determined based on an uncommon, visual fit two-piece spline model where risk rises quickly at lower exposures and then more slowly at higher exposures resulting in extremely low action levels for ethylene oxide and is currently under review. The technology may not exist to reduce ethylene oxide emissions below 0.2 µg/m3 at the fenceline on an annual average basis. Additionally, the canister method of sample collection for analysis of samples for ethylene oxide on a GC/MS introduces multiple pathways to affect the sample quality to adversely impact the results.

Wastewater Controls – There are technological and technical issues with managing the new wastewater streams designated to be in EO service. The site is in the process of upgrading and replacing an older wastewater line with that will affect the completion of the remaining work associated with this project. The technological evaluations are ongoing to determine the scope of this project. There may be technological limitations depending on what equipment is needed.

PRD Monitoring – No technology has been found to record and document the beginning and ending durations of the PRD relieving to atmosphere other than recording PRD isolations and changeouts which is not compliant with the requirements of the rule. There are over 100 PRDs with different model types that will require retrofitting with to identify the pressure release, recording the time and duration of each pressure release, and notifying operators immediately that a pressure release is occurring.

LDAR – There will likely be many types of equipment such as valves, pump seals, or instrument connections that will require upgrading as a result of the new LDAR standards. These emission compliant equipment may not be available by the regulatory deadlines. There are technological issues with replacing equipment in EO service such as changing valves to bellows seal valves. There is concern that an EO leak caught by the bellows enclosure would trap a stagnant volume of EO in the bellows enclosure. Stagnant EO can polymerizes and expands which could break the seal on the containment or self-heat to auto decomposition temperature resulting in an emergency response type event at the site. Finally, there are valves and other pieces of equipment that currently fall between the 500 ppm limit and the future 100 ppm limit that will become "leaks" on Day 1 unless resolved before the regulation comes into effect. This will require significant resources and potentially outages to address which will disrupt the supply of EO to the market.

The compliance deadlines begin on July 15, 2026 for sources in ethylene oxide service which is not enough time to complete the technical and technological evaluations as well as completing the design and installation of the necessary capital projects. An additional two years is required to fully perform the evaluations to identify all technologies not available to implement the standard. There are expected to be technology issues identified due to compatibility issues between ethylene oxide and the metallurgy as well as the gasketing, packing, and other material that come into contact with ethylene oxide. Companies must make irrevocable business decisions related to compliance with these rules in the coming months without being able to complete the required technical and technological evaluations.

Why an extension is in the national security interests of the United States:

Ethylene oxide and its derivatives are a critical building block chemical that is used in several domestic economic applications that are critical to the national security interests of the United States. The final HON Rule threatens the continued operational production and economic capacity of ethylene oxide and its associated derivatives at the INEOS ethylene oxide manufacturing facility due

to not being able to comply with certain emission standards and limitations published in 89 FR 42932 dated May 16, 2024 by the published compliance dates. The INEOS ethylene oxide manufacturing facility is a large supplier of ethylene oxide to the market that will be forced to shut down until the projects being installed to address the emissions standards or limitations are completed. This scenario will affect most if not all ethylene oxide and ethylene oxide derivative manufactures limiting the supply of ethylene oxide on the market which can adversely impact the national security interests of the United States.

Ethylene oxide plays a major role in the production of a wide variety of solvents, amines, and surfactants used in semiconductor chip manufacturing processes like wafer cutting, chemical mechanical planarization, photoresist, and photoresist residue cleaner. The semiconductor industry is one of many crucial technologies and industries that have been identified as crucial to the national security interests of the United States for which ethylene oxide and its derivatives are used. Other uses of ethylene oxide and its derivatives that are crucial to the national security interests of the United States include uses in automotive (brake fluid, antifreeze, etc.) cloud computing, medical devices, telecommunications, energy production, agriculture, and used as an additive for military jet fuel.

Please contact me if there are any questions or concerns regarding this matter. Thank you for your consideration of this matter.

Thank you,
Robert Vogel

Dear Administrator Zeldin:

Please find attached Presidential Exemption Submittal, National Emissions Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review (89 FR 38508; May 7, 2024) (MATS Rule), for City Water, Light and Power Dallman Unit 4.

Additionally, a hard copy is in the mail and we thank you for your consideration.

Dear EPA Administrator:

City Utilities of Springfield, Missouri wants to confirm receipt of our Presidential Exemption request submitted March 28, 2025. Additionally, we understand the April 8, 2025, Presidential Proclamation, provided an exemption to the National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Steam Generating Units Review of the Residual Risk and Technology Review (Mercury & Air Toxics Standard) Rule for our John Twitty Energy Center affected coal-fired unit through July 8, 2029.

We respectfully request that EPA still issue an individual exemption for our facility through July 8, 2029. We want to thank the President and the Administrator for boldly moving forward in this regard and providing needed regulatory relief for the Springfield/Greene Co. community.

Thank you.

Daniel Hedrick
Director-Environmental Affairs

Subject: Presidential Exemption: National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Steam Generating Units Review of the Residual Risk and Technology Review (MATS Rule): John Twitty Energy Center (ORISPL: 6195)

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Dear EPA Administrator:

City Utilities of Springfield, Missouri respectfully submits its request to receive a Presidential Exemption from the recent May 20024 Mercury and Air Toxic Standard (MATS) requirements for an initial 2 years, as the Administration/President reconsiders the rulemaking. We appreciate this opportunity granted by the President in light of the hefty financial burden this rule, among others, imposes on our Springfield/Greene County community-owners.

Emissions Standards or Limitations Subject to Request:

1) City Utilities (CUS) challenges the necessity of removing the low-emitting EGUs (LEE) performance test option. Our units have used this option since 2016. Request: Maintain the ability of LEE units to continue to conduct particulate matter (PM)/hydrochloric acid (HCl) testing every 3 years. [40 CFR Part 63, Subpart UUUUU, 63.10000 (c)(1)(iv)(B)]
2) City Utilities challenges the use of particulate matter (PM) as direct compliance with a hazardous air pollutant (HAPs) non-Hg metals standard. This has been used to justify the use of a continuous PM monitor over parametric or periodic PM testing for NESHAP compliance demonstration. Request: Allow PM monitoring as a surrogate for non-Hg metal HAPs emissions, but do not codify a PM monitor as the sole method for demonstrating compliance. The John Twitty Energy Center, and other power stations, have proven compliance with the NESHAP over the past 10 years and modified monitoring is not required or justify. If this request is rejected, it would allow EPA to justify PM emissions reduction costs/benefits for future HAPs standard rulemaking. The courts have rejected this cost/benefit accounting method and without PM reduction the rule is not cost-effective/justifiable and the appropriate and necessarily finding invalid. [40 CFR Part 63, Subpart UUUUU, 63.10000 (c)(1)(iv)(B); 63.10005 (c)]
3) City Utilities challenges the availability of an accurate PM monitor which can effectively monitor at the required emission rate standard using the approved EPA methodology for certification. Request: Remove any continuous PM monitor requirements. CUS believes that continuous PM monitors at the levels established in the May 2024 rule are not adequately demonstrated. EPA's own determination suggests that PM continuous emission monitoring systems cannot accurately measure PM filterable emissions below 0.015 lb/MMBtu. [40 CFR Part 63, Subpart UUUUU, 63.10010 (i)(1)-(4)]

Facility/Affected Sources:

City Utilities of Springfield, Missouri - John Twitty Energy Center (ORISPL: 6195) – Units 1 and 2

- Unit 1: 205 MW coal-fired dry-bottom, pulverized boiler, commenced operation in 1976 – burns low-sulfur Powder River Basin (PRB) coal from Wyoming, equipped with Best Available (BA) controls – Selective Catalytic Reduction (SCR) for NOx, pulse-jet baghouse for PM emissions, and activated carbon injection for mercury control.
- Unit 2: 310 MW coal-fired dry-bottom, pulverized boiler, commenced operation in 2011 – burns low-sulfur PRB coal, equipped with Best Available Control Technology (BACT) – SCR (NOx), pulse-jet baghouse (PM) and fluidized bed dry scrubber (SO2), including mercury controls.

Length of Compliance Period:
Full two (2) years beginning July 6, 2027 to July 6, 2029

Justification:

- City Utilities collected PM filterable and HCl emission data over a 3 to 6-year period (on a quarterly basis) to establish its LEE status. This means that during normal coal-fired operations, the EGUs operate at levels less than half the standard (0.030 lb/MMBtu). This is the case for nearly 95-98% of all units in the country. LEE status has been maintained over the 10-year period during each 3-year test cycle. City Utilities affected units have maintain compliance with the LEE status (which was an incentive to reduce emissions below the limit created by the original rule) in 2019, 2021-2022, 2024-2025, respectively for each unit.
- City Utilities believes a continuous PM monitor for a NESHAP, which establishes HAP emission limits, is not an appropriate tool and should not be required. Surrogate PM monitoring has been approved by EPA historically, but it is not the sole method for direct compliance demonstrations. Periodic PM testing, in conjunction with opacity monitors and baghouse differential pressure readings, is sufficient to demonstrate compliance and identify deviations from previous testing conditions, as well as pinpoint control device problems or issues.
- City Utilities is working with a HAPs monitor developer (i.e., Ohio Lumex) to collect/analyze an alternate method and is seeking EPA approvals that will take time to develop. CUS believes a NESHAP compliance monitoring requirement should directly measure HAPs emissions. Further, the extension will allow time for manufacturer/developer and EPA to seek methodology procedural approvals, as well as determine appropriate detection levels for HAPs constituent parameters and conduct comparisons to EPA Method 29 in support of those approvals.
- An extension is in the interest of national security reasons due to the combined effect of recent finalized fossil-fuel-focused regulations (i.e., May 2024) that could force or incentivize early retirement of baseload (reliable and affordable) generation where renewables cannot bridge the generation gap needs in various Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs) across the country. This could lead to energy scarcity, including rolling blackouts or grid congestion. It could also lead to excessive energy prices stifling America's ability to be competitive in manufacturing critical technology and defense-related goods.

Thank you for your consideration of this request.

Subject: Annex to presidential proclamation re stationary sources

> **Caution:** This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Hi folks:

In connection with a follow-up story for today on this proclamation (https://www.whitehouse.gov/presidential-actions/2025/04/rregulatory-relief-for-certain-stationary-sources-to-promote-american-energy/), I am again requesting a copy of Annex 1 listing the power plants that have received this CAA compliance extension.

Also, given that EPA said that exemption applications would be decided on the merits, can someone briefly explain how applications were vetted, given that President Trump appears to have approved them en masse? Were any applications rejected and, if so, for which plants?

Finally, does EPA plan to announce comparable exemptions for any companies covered by the other eight NESHAP rules listed in this guidance: https://www.epa.gov/stationary-sources-air-pollution/clean-air-act-section-112-presidential-exemption-information? If so, when and for which rules?

My deadline is 11:45 this morning. On the record responses, please.

Best regards,
Sean

Previously approved response last sent on July 23. Okay to use here?

Inquiry –
On March 28, a company called Thunderhead Energy Solutions submitted a request to EPA for a "presidential exemption" from the Clean Air Act for its proposed 500MW behind-the-meter natural gas facility in Dekalb County, Illinois. As the justification for the request, it cited permitting delays. A copy of that request (which I obtained via FOIA) is copied below.

I will also ask the same question to the White House, but just to cover my bases here, did EPA approve or deny this request? Or is this decision entirely up to the White House?

Response –

Argus Media, 1629 K Street NW, Suite 1150 | Washington DC 20006

From: Brennan, Raymond <raymond.brennan@transcanada.com>
Sent: Friday, March 08, 2019 3:29 PM
To: AirAct, Grp <AirAct@epa.gov>
Subject: Presidential Exemption, Clean Air Act, NSR and NNSR Requirements, Transcontinental Wasatch Co. LLC Data Center Power Project

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To: Whom It May Concern,

TransCanada Energy Solutions LLC requests a two-year Presidential exemption from certain Clean Air Act requirements for our 500MW behind-the-meter natural gas power facility supporting critical data center infrastructure in Dekalb County, IL.

- Emissions standards subject to exemption include: New Source Review (NSR) permitting requirements, Non-attainment New Source Review (NNSR) requirements, Title V Operating Permit timeline requirements, and New Source Performance Standards (NSPS) for Stationary Combustion Turbines (40 CFR Part 60, Subpart KKKK).
- Facility: TransCanada Data Center Power Project utilizing Solar Turbines (Caterpillar) Titan 130 "natural" gas fuel fired units with Energy Core SCR (selective catalytic reduction) technology (Best Available Control Technology, "BACT") for emissions reduction.
- Duration: Two (2) year exemption to allow expedited construction and operation.
- Justification: Current permitting timelines create critical delays and unacceptable roadblocks for essential critical infrastructure. Despite employing advanced emissions control technologies, the standard permitting process would prevent timely deployment of urgently needed computing capacity and ultimately limit the available electric generation capacity via NOx, CO, VOC, particulate matter, sulfuric acid and sulfur dioxide emissions limitations. There is no commercial technology to completely eliminate NOx, CO, VOC, particulate matter, sulfuric acid or sulfur dioxide emissions from gas fired RICEs.
- National security relevance: Our facility will support enterprise cloud, Cyber Security and Intelligence services essential to U.S. national security interests, including classified government workloads and critical AI development. Current grid constraints in DeKalb County, IL prevent large-scale, grid-connected deployment, while our behind-the-meter natural gas solution can deliver 500MW in 12-24 months, significantly accelerating national security-related computing capacity.

This bridge natural gas solution represents the only viable path to rapidly deploy the power capacity required for next-generation computing infrastructure critical for maintaining U.S. technological leadership. We

ED_018398_00005682-00001

respectfully request this time-limited exemption to expedite deployment while maintaining substantial emissions controls through our SCR implementation.

From: Chris Knight <chris.knight@argusmedia.com>
Sent: Wednesday, September 10, 2025 2:40 PM
To: EPA Press Office <press@epa.gov>
Subject: Presidential exemption request

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

EPA press,
On March 28, a company called Thunderhead Energy Solutions submitted a request to EPA for a "presidential exemption" from the Clean Air Act for its proposed 500MW behind-the-meter natural gas facility in Dekalb County, Illinois. As the justification for the request, it cited permitting delays. A copy of that request (which I obtained via FOIA) is copied below.

I will also ask the same question to the White House, but just to cover my bases here, did EPA approve or deny this request? Or is this decision entirely up to the White House?

Thanks
Chris

Subject: Presidential exemption for Clean Air Act NSR and NSPS Requirements - Hunterbrook Duvall Co IL Data Center Power Project

Caution: This email originated from outside EPA. Please exercise additional caution when deciding whether to open attached items or click on provided links.

To: Whom It May Concern:

Hunterbrook Energy Solutions LLC requests a two-year Presidential exemption from certain Clean Air Act requirements for an 810MW behind-the-meter natural gas power facility supporting critical data center infrastructure in Duvall County, IL.

- Emissions standards subject to exemption request: New Source Review (NSR) permitting requirements: Non-attainment New Source Review (NNSR) requirements, Title V Operating Permit emission requirements, and New Source Performance Standards (NSPS) for Stationary Combustion Turbines (40 CFR Part 60, Subparts KKKK)
- Facility: Hunterbrook Data Center Power Project utilizing Solar Turbines (Caterpillar) Titan 130 industrial gas turbines with Clean Energy's SCR technology (Best Available Control Technology, "BACT") for emissions reduction
- Duration: Two-year exemption for known expedited construction and operation
- Justification: Current permitting mechanisms create critical delays and unacceptable roadblocks for essential digital infrastructure. Despite employing advanced emissions control technologies, the standard permitting process would prevent timely deployment of urgently needed computing capacity and ultimately limit the operable electric generation capacity via NOx, CO, VOC, particulate matter, sulfuric acid, and sulfur dioxide emissions limitations. Utilizing commercial technology to control facility's estimate NOx, CO, VOC, particulate matter, sulfuric acid, or sulfur dioxide emissions from gas-fired facilities.
- National security relevance: The facility will support enterprise cloud and AI computing infrastructure essential to U.S. national security interests, including classified government workloads and critical AI development. Current grid constraints in Duvall County, IL prevent timely, reliable power deployment, while our behind-the-meter natural gas solution can deliver 810MW in 6-24 months, significantly accelerating national security-related computing capacity.

This leverages natural gas solutions represents the only viable path to rapidly deploy the power capacity required for next-generation computing infrastructure critical for maintaining U.S. technological leadership. We

ED_021114A_00006682-00001

respectfully request this time-limited exemption to expedite deployment while maintaining substantial emissions controls through our SCR implementation.

Hi Taylor,

We received the below inquiry from Argus Media this afternoon. Our response is copied below. The reporter will likely reach out to you shortly.

Please let me know if you have any questions.

Best,
Brigit

Response –

Clean Air Act section 112(i)(4) authorizes the President to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." The EPA played no role in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

Subject: Presidential Exemption - Clean Air Act NSR and NNSR Requirements - Transcontinental Realty Co. I - Data Center Power Project

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

To: Whom It May Concern,

Transcontinental Realty Solutions LLC requests a two-year Presidential exemption from certain Clean Air Act requirements for our 500MW behind-the-meter natural gas power facility supporting critical data center infrastructure in DeKalb County, IL.

- Emissions standards subject to exemption or request: New Source Review (NSR) permitting requirements, Non-attainment New Source Review (NNSR) requirements, Title V Operating Permit timeline requirements, and New Source Performance Standards (NSPS) for Stationary Combustion Turbines (40 CFR Part 60, Subpart KKKK)
- Facility: Transcontinental Data Center Power Project utilizing Solar Turbines (Caterpillar) Titan 130 industrial gas turbines with Energy Core SCR (Selective Catalytic Reduction) technology (Best Available Control Technology, "BACT") for emissions reduction
- Duration: Two-year exemption to allow expedited construction and operation
- Justification: Current permitting timelines create critical delays and unacceptable roadblocks for essential critical infrastructure. Despite employing advanced emissions control technologies, the standard permitting process would prevent timely deployment of urgently needed computing capacity and ultimately limit the available electric generation capacity via NOx, CO, VOC, particulate matter, sulfuric acid, and sulfur dioxide emissions limitations. It can be a commercial challenge to completely eliminate NOx, CO, VOC, particulate matter, sulfuric acid, or sulfur dioxide emissions from gas-fired EGUs.
- National security relevance: Our facility will support enterprise cloud, Government agency services essential to U.S. national security interests, including classified government workloads and critical AI development. Current grid constraints in DeKalb County, IL prevent large-scale power deployment, while our behind-the-meter natural gas solution can deliver 500MW in 18-24 months, significantly accelerating national security-related computing capacity.

This bridge natural gas solution represents the only viable path to rapidly deploy the power capacity required for next-generation computing infrastructure critical for maintaining U.S. technological leadership. We

ED_018398_00005682-00001

respectfully request this time-limited exemption to expedite deployment while maintaining substantial emissions controls through our SCR implementation.

Abbie:

Our mutual friend Ryan Jackson said that you're helping manage the various NESHAP reconsiderations, including the copper smelting NESHAP (Subpart QQQ). Ryan and I worked together in Trump 45 when I was the OECA DAA.

On behalf of our client Freeport McMoRan, I'm writing to set up a brief call with you to discuss the process by which Freeport could best support the EPA's efforts to reconsider the rule and obtain a Presidential exemption under Section 112(i).

We're aware that information supporting a Presidential exemption is due March 31, so we'd like to chat with you as far in advance of that date as is convenient for you.

I'd be joined on the call by Todd Weaver from Freeport.

Warm regards,
Patrick

Washington, D.C. 20460

Re: Presidential Exemption: "National Emission Standards for Hazardous Air Pollutants: Primary Copper Smelting Residual Risk and Technology Review and Primary Copper Smelting Area Source Technology Review," 89 Fed. Reg. 41648 (May 13, 2024): Miami Smelter in Gila County, Arizona

Dear Administrator Zeldin:

Freeport-McMoRan Miami Inc. ("FMMI") writes to request a two-year Presidential Exemption under Section 112(i)(4) of the Clean Air Act for compliance deadlines applicable to FMMI's primary copper smelter located near Miami in Gila County, Arizona ("Miami Smelter"). This request applies to all the deadlines promulgated under the National Emission Standards for Hazardous Air Pollutants: Primary Copper Smelting Residual Risk and Technology Review and Primary Copper Smelting Area Source Technology Review, 89 Fed. Reg. 41648 (May 13, 2024) ("Copper Rule"). For the reasons set out in more detail below, the technology to implement the Copper Rule is not available, and it is in the national security interests of the United States for the President to grant a two-year exemption.

I. The technology to implement the Copper Rule is so radically cost-ineffective that it is "not available" in a commonsense understanding of the term

Congress has committed the determination as to whether a technology is "available" to the President's discretion.[1] This discretion includes the consideration of costs when determining if a control technology is available.[2] Based on a sophisticated engineering and cost estimation process, FMMI

[1] The Supreme Court has recognized that where "the President acts pursuant to an express or implied authorization of Congress, his authority is at its maximum, for it includes all that he possesses in his own right plus all that Congress can delegate." *Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579, 635 (1952) (Jackson, J., concurring).

[2] *Cf. Michigan v. EPA*, 576 U.S. 743, 755–57 (2015) (finding that the EPA unreasonably deemed cost irrelevant when it decided to regulate hazardous air pollutants from power plants).

estimates that the pollution controls required to comply with the main requirements of the Copper Rule will cost in the range of $237 million to $309 million or higher and will reduce only between 0.2 and 2.2 tons per year of metal hazardous air pollution ("HAP"). Using the annualized capital and operating cost approach under the EPA's Air Pollution Cost Control Manual, these controls will cost between $21 million and $164 million per ton of metal HAP removed. That figure is between 16 and 123 times higher than the EPA's long-established cost-effectiveness limit of $1.3 million per ton metal HAP.[3] Such radical cost-ineffectiveness renders the required technology "unavailable" under any commonsense understanding of the term. This radical cost ineffectiveness is compounded by the absolute cost of compliance, which will run into the hundreds of millions of dollars.[4] An inability to maintain or increase throughput at the Miami Smelter – a potential outcome given the Copper Rule's radical cost-ineffectiveness – would have significant impacts on the domestic copper supply chain to the detriment of national security interests of the United States.

II. A two-year compliance extension is in the national security interests of the United States because of the importance of domestically sourced copper

The Miami Smelter is one of only two primary copper smelters left in operation in the United States and is a key asset that supports Freeport-McMoRan Inc.'s production of some 70 percent of the nation's domestic copper. The President has recognized that copper is "a critical material essential to the national security, economic strength, and industrial resilience of the United States."[5] Copper plays a key role in national defense, energy production, building construction, transportation equipment, industrial machinery and equipment, advanced electronics, and emerging technologies like artificial intelligence. Independent analysts are reasonably concerned that as soon as 2035, global copper production may fall short of global demand by some 12 billion pounds annually.[6] At present, the nation's smelting and refining capacity is critically low, has long been in decline, and lags significantly behind that of global competitors. As a result, the United States

---

[3] *See* 88 Fed. Reg. 55858, 55879 (Aug. 16, 2023) (coke oven proposed NESHAP revisions). These engineering-based cost estimates are much higher than the EPA anticipated during rule development.

[4] FMMI has expressed its longstanding objections to the Copper Rule – including its outlandish compliance costs – through its public comments, its petition for reconsideration, and its petition for judicial review of the final rule.

[5] Exec. Order No. 14,220, *Addressing the Threat to National Security from Imports of Copper*, 90 Fed. Reg. 11001 (Feb. 25, 2025); *see also* Exec. Order No. 14,241, *Immediate Measures to Increase American Mineral Production*, 90 Fed. Reg. 13673 (Mar. 20, 2025).

[6] S&P Global, *The Future of Copper: Will the Looming Supply Gap Short-Circuit the Energy Transition?* 46 (2022), https://perma.cc/FGD2-6KHH [hereinafter *Future of Copper*].

must import almost half of its copper demand each year.[7] This strategic vulnerability to, and increasing dependence on, foreign sources of smelting — particularly from a concentrated number of foreign supplier nations, including China — presents a national security risk.[8] Accordingly, a two-year compliance extension is in the national security interests of the United States.

We have attached to this letter additional support for this request. Please do not hesitate to contact Todd Weaver at tweaver1@fmi.com or (602) 366-7818 should you have any questions or need additional information.

Sincerely,

William E. Cobb
Vice President and Chief Sustainability Officer
Freeport-McMoRan Inc.

Additional Materials in Support of Request for Presidential Exemption

On March 12, 2025, the U.S. Environmental Protection Agency ("EPA" or the "Agency") announced that it will reconsider several National Emission Standards for Hazardous Air Pollutants ("NESHAP") rulemakings.[1] One NESHAP rulemaking identified by that announcement is the one applicable to primary copper smelting, entitled "National Emission Standards for Hazardous Air Pollutants: Primary Copper Smelting Residual Risk and Technology Review and Primary Copper Smelting Area Source Technology Review," published at 89 Fed. Reg. 41648 (May 13, 2024) ("Copper Rule").[2] The EPA also announced that "[t]he Trump Administration is considering a 2-year compliance exemption under Section 112(i)(4) of the Clean Air Act (the "Act") for affected facilities while EPA goes through the rulemaking process."

In response to the EPA's announcement, Freeport-McMoRan Miami Inc. ("FMMI") has submitted a request for an exemption pursuant to Section 112(i)(4) of the Act, for its primary copper smelter located in Gila County, Arizona, near the town of Miami ("Miami Smelter"). FMMI requests that the Section 112(i)(4) compliance exemption exempt the Miami Smelter from the new standards and limitations prescribed by the Copper Rule for the full initial two-year period authorized under the statute. As explained below, FMMI believes that the statutory criteria for a Section 112(i)(4) compliance exemption are met.

I. Background

A. FMMI and the Miami Smelter

FMMI owns and operates the Miami Smelter, a primary copper smelter[3] that was constructed and put into operation in 1915. By FMMI's estimate, the Miami Smelter was one of nineteen primary copper smelters operating in the United States in the 1970s, spread out across multiple states. Over time, however, most of those smelters have shuttered. As of today, only three primary copper smelters remain, with only two (one of which is the Miami Smelter) currently operating. And of those, the Miami Smelter is the only active facility regulated under the Copper Rule.[4]

Over the years, FMMI has made significant capital investments in the Miami Smelter, including the installation of an electric furnace, gas handling/cleaning systems and a double contact sulfuric

[3] Primary copper smelting entails extracting copper directly from copper-bearing mined ore. It is distinct from secondary copper smelting, which recycles copper from scrap and other "waste" sources.

[4] *See* 40 C.F.R. Part 63, Subpart QQQ.

acid plant in 1972, the installation of a more energy-efficient IsaSmelt® vessel in 1992, and upgrades to the facility's particulate matter ("PM") and sulfur dioxide ("SO_2") emission control systems from 2013 to 2017. The Miami Smelter, moreover, is certified according to multiple International Organization for Standardization ("ISO") standards, including ISO 14001 (Environmental Certification) and ISO 45001 (Health & Safety Certification), as well as according to Copper Mark, a comprehensive industry assurance framework designed to demonstrate responsible production practices.

FMMI's operations generate substantial benefits locally (nearly $100 million for Gila County) and for the State of Arizona (almost $300 million) in the form of tax revenues and spending by employees. In 2022, FMMI employed 830 people and created nearly 3,000 additional jobs in Arizona, through the effects of wages, taxes, and services purchased.

FMMI is a subsidiary of Freeport-McMoRan Inc. ("FCX"), one of the world's largest publicly traded copper producers (NYSE: FCX). FCX, headquartered in Phoenix, Arizona, is also the largest copper mining company in the United States, operating seven open-pit copper mines in Arizona (including the large-scale Morenci minerals district in Arizona) and New Mexico, as well as copper processing facilities in Arizona and Texas. All told, FCX's domestic operations annually produce approximately 1.4 billion pounds of copper, accounting for a third of its global production.

FCX recognizes that mining and metal processing impacts the natural environment, and FCX's goal is to conduct mining and processing operations in a manner that minimizes adverse impacts on the environment and supports the protection of ecosystems through responsible environmental stewardship. To that end, FCX understands that environmental protection and stewardship are key to ensuring the long-term viability of its business, including maintaining the necessary support from host communities and governments. FCX's policy objectives include minimizing environmental impacts including those from hazardous air pollutants ("HAP") regulated under the NESHAP program using risk management strategies based on valid data and sound science. Over the years, FMMI has worked collaboratively with the EPA and its technical team to develop effective and workable NESHAP standards applicable to the Miami Smelter.

B. The copper production process

The copper value chain includes more than simply the mining of copper-bearing ore, which itself contains minimal copper by concentration. Copper-bearing ore must be processed to remove its impurities, ultimately resulting in a key intermediary product of copper production copper "anode." Copper anode is traditionally produced by milling sulfide copper ore to create a copper concentrate that is then converted into copper anode through smelting. That is the production process used by the Miami Smelter. The smelting process also produces sulfuric acid, which is then reintegrated upstream into the value chain to be used in mining operations. The Miami Smelter transports its copper anode to an electrorefining facility in El Paso, Texas to produce copper "cathode," which is a very pure form of copper (typically of at least 99.95 percent purity). Copper cathode is the principal form of copper traded on global markets, and it is the product that is further processed for downstream industrial, commercial, and consumer purposes.

FCX's U.S. operations accounted for approximately 70 percent of the total production of U.S. refined copper in 2024. All the anodes manufactured at the Miami Smelter are refined at the El Paso, Texas facility. The vertical integration of FCX's operations allows it to retain the overwhelming majority of its copper production domestically and minimize the amount of copper concentrates that must be exported for smelting and, if necessary, refining.

C. The Copper Rule and subsequent developments

After concluding its periodic residual risk and technology review ("RTR") for the NESHAP for major source Primary Copper Smelters, and its technology review for the Primary Copper Smelting area source NESHAP, the EPA issued a notice of proposed rulemaking,[5] followed later by a supplemental notice of proposed rulemaking.[6] During the rulemaking process, FMMI provided robust comments and technical analyses in response to those notices, as well as responses to follow-on information requests from the Agency. FMMI's comments highlighted, among other things, problems with the EPA's residual risk analysis, the feasibility and cost effectiveness of certain numerical emission limits, and the workability of certain proposed work practice standards. The EPA issued the Copper Rule on May 13, 2024.[7]

Following promulgation of the Copper Rule, FMMI determined—as a result of early-stage engineering studies undertaken as part of FMMI's efforts to implement the final rule—that certain aspects of the Rule would make compliance extremely difficult to achieve, and potentially even cost prohibitive from the standpoint of maintaining economically viable smelter operations.

FMMI submitted to the EPA a petition for reconsideration of the Copper Rule on July 12, 2024. To date, and to FMMI's present knowledge, the EPA has not formally acted upon FMMI's petition for reconsideration, aside from the EPA's March 12 press release announcing the Agency's intent to reconsider the Copper Rule, among other NESHAP rules. On the same day it submitted the petition for reconsideration, FMMI also filed a petition for review of the Copper Rule in the U.S. Court of Appeals for the District of Columbia Circuit. FMMI's petition for review was consolidated with that filed by the San Carlos Apache Tribe and Sierra Club. *See San Carlos Apache Tribe, et al. v. EPA, et al.*, No. 24-1241 (D.C. Cir.) (consolidated with No. 24-1245). On October 24, 2024, the parties filed a joint motion to hold the matter in abeyance pending the EPA's resolution of the petitions for reconsideration. The motion was granted on November 4, 2024. In a joint status report filed with the court on February 3, 2025, the EPA represented that it is continuing to consider the petitions for reconsideration before it.

II. FMMI's request for a Presidential Exemption meets the statutory requirements under Section 112(i)(4)

Section 112(i)(4) of the Act provides that "[t]he President may exempt any stationary source from compliance with *any standard or limitation under this section* for a period of not more than 2 years if the President determines that *the technology to implement such standard is not available* and that *it is in the national security interests of the United States to do so*."[8]

As initial matters, the Miami Smelter is a stationary source subject to the Copper Rule's standards and limitations. The Copper Rule was promulgated by the EPA pursuant to Section 112(d) and 112(f) of the Act.[9] The language "any standard or limitation under this section" in Section 112(i)(4) means that the President may exempt a stationary source from any type of standard or limitation promulgated pursuant to Section 112, regardless of the particular subdivision relied upon by the EPA.[10] It is thus of no consequence, for purposes of the Presidential Exemption, that the EPA relied upon both Section 112(d) and 112(f) to promulgate the Copper Rule.

Section 112(i)(4) calls for two predicate determinations. First, the President must determine that "the technology to implement [the exempted standard or limitation] is not available." Second, the President must determine that "it is in the national security interests of the United States" to exempt the stationary source from compliance. Below, FMMI explains why both predicate determinations are met with respect to the Copper Rule.

A. The technology to implement the Copper Rule is so radically cost-ineffective that it is "not available" in a commonsense understanding of the term

The President must "determine[]" that "the technology to implement" the exempted standard or limitation "is not available."[11] As detailed below, Congress did not specify under what circumstances the President should find a technology "not available" and instead committed this determination to the President's discretion. Here, the radical cost ineffectiveness of the requisite control technology strongly supports finding it "not available."

Based on a sophisticated engineering and cost estimation process, FMMI estimates that the pollution controls required to comply with the main requirements of the Copper Rule will cost in the range of $237 million to $309 million or higher and will reduce only between 0.2 and 2.2 tons per year of metal HAP. Using the annualized capital and operating cost approach under the EPA's Air Pollution Cost Control Manual, these controls will cost between $21 million and $164 million per

---

[10] *Cf. Babb v. Wilkie*, 140 S. Ct. 1168, 1173 n.2 (2020) ("We have repeatedly explained that the word 'any' has an expansive meaning." (internal quotation marks and citation omitted)); *accord New York v. EPA*, 443 F.3d 880, 885 86 (D.C. Cir. 2006) (giving the word "any," as used in the Clean Air Act, an "expansive meaning" (citations omitted)).

[11] 42 U.S.C. § 7412(i)(4).

ton of metal HAP removed. That figure is between 16 and 123 times higher than the EPA's long-established cost-effectiveness limit of $1.3 million per ton metal HAP.[12]

1. Congress committed the determination of whether a technology is "available" under Section 112(i)(4) to the President's discretion

The Act does not specify when a technology should be determined "available" for purposes of Section 112(i)(4).[13] Instead, Congress has committed such determination to the President's discretion. This is clear from the text of Section 112(i)(4), which authorizes an exemption "if the President determines" the requisite criteria are met, without provision for judicial second-guessing of that determination.[14]

The Supreme Court has recognized that where "the President acts pursuant to an express or implied authorization of Congress, his authority is at its maximum, for it includes all that he possesses in his own right plus all that Congress can delegate."[15] Such is the case here, where Congress explicitly authorized the President to determine whether a technology is "available," at his discretion and only with the added requirement that "[t]he President shall report to Congress with respect to each exemption (or extension thereof)."[16]

2. The radical cost ineffectiveness of the requisite controls warrants a finding of technological unavailability

Here, the radical cost ineffectiveness of the requisite controls supports a finding of technological unavailability. As leading scholars of administrative and regulatory law have long observed, common sense dictates that a technology is not "available" if it is radically cost-ineffective:

[12] *See* 88 Fed. Reg. 55858, 55879 (Aug. 16, 2023) (coke oven proposed NESHAP revisions). These engineering-based cost estimates are much higher than the EPA anticipated during rule development.

[13] Nor to FMMI's knowledge has any court meaningfully interpreted the scope of "available" under Section 112(i)(4).

[14] It is clear from the statute, moreover, that to the extent Congress contemplated a check on the President's authority, the relevant check was its own (i.e., Congress's) ongoing oversight, not judicial review. *See* 42 U.S.C. § 7412(i)(4) (providing that the President "shall report to Congress" on each exemption).

[15] *Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579, 635 (1952) (Jackson, J., concurring); *see Haig v. Agee*, 453 U.S. 280, 294 (1981) (concluding that on the matter of passport controls, "Congress endorsed not only the underlying premise of Executive authority in the areas of foreign policy and national security, but also its specific application to the subject" through authorizing legislation); *see also Franklin v. Massachusetts*, 505 U.S. 788, 801 (1992) ("Although the President's actions may still be reviewed for constitutionality, we hold that they are not reviewable for abuse of discretion under the APA.") (internal quotation marks and citation omitted); *Am. Int'l Grp., Inc. v. Islamic Republic of Iran*, 657 F.2d 430, 440–41 (D.C. Cir. 1981) (applying Justice Jackson's tripartite *Youngstown* framework and determining that the President was "acting pursuant to an unequivocal statutory grant of authority"; "we perceive no erosion of the constitutional principle of the separation of powers in upholding the actions").

[16] 42 U.S.C. § 7412(i)(4).

ED_018388_00000153-00008
ED_021114A_00007586-00017

> "Available technology" is an elastic concept. In many instances . . . technology is available in an engineering sense to eliminate pollution entirely. If we were willing to spend hundreds of billions of dollars, we could have drinking water flowing from industrial waste discharge pipes (although disposing of the pollutants removed from waste streams could present serious problems). *Accordingly, most decisions about "available" technology must implicitly or explicitly take costs into account.*[17]

The same commonsense understanding has also guided courts reviewing the EPA's authority to find that consideration of regulatory costs is an essential prerequisite for reasoned decision making and to find that controls imposing "possibly disabling costs upon the regulated industry" should not be deemed "available."[18] The radically cost-ineffective controls imposed by the Copper Rule may be "possibly disabling" to maintaining economically viable operations at the Miami Smelter, which creates the risk that curtailed domestic production will make the United States strategically vulnerable.

As discussed below, consideration of (i) the cost of the requisite controls on a dollars per ton of emissions reduced basis and (ii) EPA policy acknowledging that extraordinarily expensive controls are not "available" under the Act's New Source Review program further support a finding that the requisite controls are not available.

Using the annualized capital and operating cost approach under the EPA's Air Pollution Cost Control Manual, these controls will cost between $21 million and $164 million per ton of metal HAP removed. That figure is between 16 and 123 times higher than the EPA's long-established cost-effectiveness limit of $1.3 million per ton metal HAP. Such radical cost-ineffectiveness renders the control technology "not available."

EPA guidance interpreting the term "best available control technology" under the Act further supports a finding that the extraordinarily expensive requisite controls are "not available." Even when the Act tasks the EPA with determining the "best" control technology "available," the Act requires

---

[18] *Am. Petroleum Inst. v. EPA*, 787 F.2d 965, 972 (5th Cir. 1986) (evaluating "best available technology economically achievable" (BAT) limitations under the Clean Water Act in offshore drilling-related permits and explaining, "EPA would disserve its mandate were it to tilt at windmills by imposing BAT limitations which removed de minimis amounts of polluting agents from our nation's waters, while imposing possibly disabling costs upon the regulated industry" (citations omitted)); *id.* ("We agree with the Ninth Circuit's comment that, 'at some point[] extremely costly more refined treatment will have a de minimis effect on the receiving waters.'" (quoting *Ass'n of Pac. Fisheries v. EPA*, 615 F.2d 794, 818 (9th Cir. 1980))); *see also Michigan v. EPA*, 576 U.S. 743, 755–57 (2015) (finding that EPA unreasonably deemed cost irrelevant when it decided to regulate HAPs from power plants under the Act); *Riverkeeper, Inc. v. EPA*, 358 F.3d 174, 181–83 (2d Cir. 2004) (evaluating BAT limitations and recognizing that "EPA is permitted to consider a *technology's cost* in determining whether it is practicable, economically achievable, *or available*") (emphasis added) (internal quotation marks and citation omitted).

consideration of "economic impacts and other costs."[19] And EPA guidance recognizes that unreasonably expensive controls are *not* "best available control technology."

Accordingly, consistent with the EPA's own recognition of the commonsense principle that radically cost ineffective controls are not "available," the President would be justified in using his discretion to find that the controls here are not available.

B. A two-year compliance extension is in the national security interests of the United States because of the importance of domestically sourced copper

The President must also "determine[]" that a compliance exemption "is in the national security interests of the United States."[20] There is ample evidence that it is in the United States' national security interests to exempt FMMI's Miami Smelter from compliance with the Copper Rule. In short, the Miami Smelter is one of only two primary copper smelters currently operating in the United States, and the facility generates a significant portion of the nation's domestically produced copper. If, as a result of the unavailability of technology to meet the Copper Rule, FMMI cannot maintain economically viable smelter operations at the facility, the curtailment of that domestic production risks making the United States strategically vulnerable to, and increasingly dependent upon, foreign suppliers of copper (particularly China). That outcome would be problematic because global copper demand is forecasted to significantly increase—and likely outstrip global supply in the coming decades.

1. The scope of "national security interests of the United States" under Section 112(i)(4) of the Act is broad

The Clean Air Act does not define the scope of "national security interests of the United States" for purposes of Section 112(i)(4), and to FMMI's knowledge, no court has meaningfully interpreted its scope. Broadly speaking, "national security" is a capacious term without a single controlling definition.[21] However, the principle, especially following the close of the Cold War, has been understood to go beyond military defense and protection from interstate conflict, and instead to encompass a wider range of threats to the safety, welfare, and values of the nation, such as resource or energy scarcity, disruption of economic activities, and trade restrictions or barriers.[22]

---

[19] 42 U.S.C. § 7479(3) ("The term 'best available control technology' means an emission limitation . . . which the permitting authority . . . taking into account . . . economic impacts and other costs, determines is achievable . . . .").

Coop. and Dev., *Security-Related Terms in International Investment Law and in National Security Strategies* 11 (2009), https://perma.cc/DN99-J5T7 (study of states' national security policies finding that

ED_018388_00000153-00010
ED_021114A_00007586-00019

In fact, recent presidential administrations, regardless of party affiliation, have identified certain transnational and domestic economic and natural resource matters as potential national security interests or threats: energy market disruptions; promotion of domestic research, development, and manufacturing in emerging technologies; and restricted access to international markets.[23]

The Supreme Court, for its part, has afforded the political branches substantial deference with respect to national security matters, including with respect to the factual findings and policy decisions of the Executive Branch.[24] As noted above, courts have also recognized that where "the President acts pursuant to an express or implied authorization of Congress, his authority is at its maximum, for it includes all that he possesses in his own right plus all that Congress can delegate."[25] Such is the case here, where Congress explicitly authorized the President to make national security determinations, at his discretion and only with the added requirement that "[t]he President shall report to Congress with respect to each exemption (or extension thereof)."[26]

2. *President Trump, Congress, and the previous administration have all recognized the critical importance of copper to the national security of the United States*

President Trump has recognized that "the United States has ample copper reserves, yet our smelting and refining capacity lags significantly behind global competitors," finding that foreign "dominance" of copper smelting and refining "poses a direct threat to United States national security

---

"national security . . . refers to protecting nations and citizens," and that states "aspire to a broad and integrated management of risks, often including all threats to public safety that require coordinated, nationwide responses," including threats like "energy security," "global pandemics," and "man-made emergencies").

[23] *See* The White House, *National Security Strategy of the United States of America* 17–23 (2017), https://perma.cc/D9MV-FQSJ; The White House, *National Security Strategy* 2, 15, 16–17 (2015), https://perma.cc/2NMM-QYH5; The White House, *A National Security Strategy of Engagement and Enlargement* 7, 8 (1995), https://perma.cc/4QCK-4QMN (explaining that the United States' "security requirements . . . start with our physical defense and economic well-being" while also identifying that "[a]n emerging class of transnational environmental and natural resource issues is increasing affecting international stability").

[24] *See Holder v. Humanitarian Law Project*, 561 U.S. 1, 34 (2010) ("But when it comes to collecting evidence and drawing factual inferences in" the areas of national security and foreign relations, "the lack of competence on the part of the court is marked, and respect for the Government's conclusions is appropriate." (internal quotation marks and citation omitted)); *id.* at 34–35 (recognizing that "[i]n th[e] context" of national security and foreign relations, "conclusions must often be based on informed judgment rather than concrete evidence, and that reality affects what we may reasonably insist on from the Government"); *Winter v. Nat. Def. Res. Council*, 555 U.S. 7 (2008) (deference to the President after explicit finding: "The President determined that continuation of the exercises as limited by the Navy was 'essential to national security.'"); *see also Dep't of Navy v. Egan*, 484 U.S. 518, 530 (1988) ("[C]ourts traditionally have been reluctant to intrude upon the authority of the Executive in military and national security affairs.").

ED_018388_00000153-00011
ED_021114A_00007586-00020

and economic stability."[27] President Trump has also described the criticality of copper by recently recognizing the mineral's importance "to the national security, economic strength, and industrial resilience of the United States," as well as the "significant vulnerabilities in the copper supply chain, with increasing reliance on foreign sources for mined, smelted, and refined copper."[28] Indeed, the United States' "increasing dependence on foreign sources of copper, particularly from a concentrated number of supplier nations, along with the risk of foreign market manipulation," introduces trade concerns that threaten national security.[29] Likewise, FMMI notes that the Administration has reiterated that domestic mineral production, including of copper, is a strategic national interest, especially as a means to "reduce . . . reliance on foreign nations" and generate "a secure, predictable, and affordable supply of minerals."[30]

This Administration's actions fit within a broader federal policy to ensure reliable, secure, and resilient domestic supply chains for key minerals and materials. As part of the Energy Act of 2020, Congress set forth its findings that:

- "the availability of materials[31] is essential for national security, economic well-being, and industrial production";
- "the availability of materials is affected by the stability of foreign sources of essential industrial materials, instability of materials markets, international competition and demand for materials, the need for energy and materials conservation, and the enhancement of environmental quality"; and
- "extraction, production, processing, use, recycling, and disposal of materials are closely linked with national concerns for energy and the environment."[32]

Congress also set forth its policy "to promote an adequate and stable supply of materials necessary to maintain national security, economic well-being and industrial production" in order to "assure the availability of materials critical to commerce, the economy, and national security" and to

[27] Exec. Order No. 14,220, *Addressing the Threat to National Security from Imports of Copper*, 90 Fed. Reg. 11001 (Feb. 25, 2025).

[29] *Id.*

[30] Exec. Order No. 14,241, *Immediate Measures to Increase American Mineral Production*, 90 Fed. Reg. 13673 (Mar. 20, 2025).

[31] Defined as "substances, including minerals, of current or potential use that will be needed to supply the industrial, military, and essential civilian needs of the United States in the production of goods or services, including those which are primarily imported or for which there is a prospect of shortages or uncertain supply, or which present opportunities in terms of new physical properties, use, recycling, disposal or substitution, with the exclusion of food and of energy fuels used as such." 30 U.S.C. § 1601(b)(2).

[32] *Id.* § 1601(a)(1)–(3).

"avoid supply shortages, mitigate price volatility, and prepare for demand growth and other market shifts."[33]

The Energy Act of 2020 identified a need to secure continued access to critical materials, defined as "any non-fuel mineral, element, substance, or material that the Secretary of Energy determines . . . has high risk of a supply chain disruption[] and serves an essential function in 1 or more energy technologies, including technologies that produce, transmit, store, and conserve energy."[34] Relevant here, the Department of Energy, in its 2023 *Critical Materials Assessment*, projects that copper will be a "near-critical" material in the medium term (2025 to 2035).[35] DOE, moreover, identified copper as a "critical material for energy" in its Final Critical Materials List.[36]

3. Non-governmental experts have concluded that the United States will need more copper in the coming decades, likely outstripping supply

There is broad public acknowledgment that copper is and will continue to be an essential mineral, and that current levels of copper production are likely insufficient to meet global demand in the face of those growing demand pressures from the energy transition. S&P Global, in its *Future of Copper* study, outlined its demand projections for copper as the United States and other nations pivot towards electrification and clean energy policies. The report predicts a doubling of global copper demand by 2035—from about 25 million metric tons ("MMt") annually to about 50 MMt annually driven in large part by the increased adoption of electric vehicles (and the development of charging infrastructure) and the construction, deployment, and integration of renewable energy projects.[37] S&P Global also forecasts that global demand increases will remain resilient at approximately 50 MMt annually, well into 2050.[38]

S&P Global's forecasts generally accord with those of other entities. McKinsey & Company estimates that annual global copper demand will reach 36.6 MMt by 2031.[39] Wood Mackenzie, a leading energy consultant, forecasts that the annual demand for copper will grow to 56 MMt by 2050, an increase of about 75 percent.[40] The Department of Energy likewise observes that "[t]he

demand for [copper] is increasing significantly."[41] There is thus little indication that global copper demand will do anything but increase in the coming decades.

Copper has unique properties—namely, its ability to efficiently conduct electricity and withstand high temperatures, as well as its ductility and recyclability — that make it an essential commodity. Copper is critical to the production of electric vehicles, batteries, renewable energy projects, conventional energy projects like hydroelectric, thermal, and nuclear power, and electrification infrastructure (e.g., transmission, distribution, charging).[42] Electric vehicles, in particular, require roughly 2.5 times as much copper as an internal combustion engine vehicle.[43] Copper is used in every major component of an electric vehicle, such as motors and inverters, such that an electric vehicle can use up to a mile of copper wire.[44] Similarly, solar and offshore wind will need, respectively, two and five times more copper per megawatt of installed capacity as compared to power generated using natural gas or coal.[45]

Importantly, the demand pressures arising from the global energy transition are in addition to non-energy transition needs. According to the United States Geologic Survey ("USGS"), in 2024, a little over 40 percent of copper and copper alloy products in the United States was used for building construction, while another 18 percent was used for transportation equipment, and another 7 percent for industrial machinery and equipment.[46] And S&P Global projects that demand from non-energy transition end markets — such as building construction, appliances, electrical equipment, and brass hardware and cell phones, as well as expanding applications in communications, data processing, and storage—is also expected to continue to grow, rising at a compounded annual rate of 2.4 percent between 2020 and 2050.[47]

Of course, demand does not exist in a vacuum. On the supply side, there are growing concerns that global copper production will not be sufficient to meet growing demands. In the present term,

growth in global copper production has been described as "sluggish."[48] Longer term, S&P Global projects that under its most ambitious outlook for supply (i.e., one that contemplates expansions in mining capacity, improved mining and production efficiencies, and increased recycling), there is still an expected shortfall of 1.6 MMt in 2035.[49] Its much less optimistic outlook, moreover, expects a shortfall close to 10 MMt in 2035.[50] S&P Global's findings align with those of others.[51] With respect to copper cathodes, recycling and the addition of secondary copper smelting capacity is unlikely to close expected shortfalls — recycling provides only about 32 percent of current and likely future cathode supply.[52]

Ensuring and expanding efficient production of copper is critical for national security and the U.S. economy. Primary copper smelting capacity in the United States is critically low and has long been in decline. As noted previously, the Miami Smelter is one of only two primary copper smelters left in operation in the United States and is a key asset that supports Freeport-McMoRan Inc.'s production of some 70 percent of the nation's domestic copper. ***An inability to maintain or increase throughput at the Miami Smelter—a potential outcome given the Copper Rule's radical cost ineffectiveness, see supra Section II.A—would have significant impacts on the domestic copper supply chain to the detriment of the national security interests of the United States.***

Domestically, the United States produces some fifty percent of the refined copper it consumes each year.[53] The remaining amount is imported, largely from Chile, Canada, and Peru. Notably, however, the U.S. copper supply chain typically results in significant quantities of copper-bearing ores and copper concentrates from domestic mining operations being exported for processing at foreign smelters, typically located in China. Refined copper is then imported back into the United States.[54] This reflects the reality that while copper mining is often geographically concentrated in a manner that favors the United States, the subsequent stages in the copper production process (i.e., smelting, refining, fabrication, and manufacture of finished goods) are presently, and increasingly, concentrated outside the United States, particularly in China.[55] A Wood Mackenzie report on the topic confirms that "China has continued to dominate investment in the [copper] supply

chain," and that "China has accounted for 75 percent of all global smelter capacity growth."[56] The United States, for its part, "has tilted towards the secondary market and scrap."[57] This import-export relationship also reduces the availability of domestic sulfuric acid, which as noted previously, is a byproduct of primary copper smelting and is often re-inserted upstream for mining activities.

In sum, the global copper market is likely approaching an inflection point, where global demand outstrips global supply. The Miami Smelter represents a critical component of the United States' ability to produce copper domestically. The Copper Rule, however, presents a material threat to the continued operation of and the ability to expand production at the Miami Smelter, given its radical cost ineffectiveness. *See supra* Section II.A.

Hi Brigit and EPA press team,

I hope you're all doing well. I'm working on an article about Freeport-McMoRan's copper smelter in Miami, Arizona, which President Trump exempted from compliance with EPA's copper rule last month.

The article will mention that Abigale Tardif, the principal deputy assistant administrator in EPA's Office of Air and Radiation, emailed with a lobbyist for Freeport-McMoRan about how the company could best position itself to obtain the presidential exemption under the Clean Air Act, according to emails obtained by the Environmental Defense Fund via the Freedom of Information Act.

I have attached those emails for your reference, and I was hoping you could answer the following questions. My deadline is currently set for **5pm ET tomorrow**, although it might be extended.

- Can you confirm whether Abigale Tardif had a call with the lobbyist for Freeport-McMoRan, Patrick Traylor, in March?
- How would EPA respond to criticism from environmentalists that these emails show a remarkable degree of coordination between the agency and one of the companies it regulates?

Please let me know and thank you for considering this request. I will also reach out to the White House regarding the presidential exemption.

Best,
Maxine

RE: Request for Presidential Exemption: *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review* (89 Fed. Reg. 38,508 (May 7, 2024)); Craig Generating Station, Moffat County, Colorado

Dear Administrator Zeldin:

Tri-State Generation and Transmission Association ("Tri-State") respectfully submits this request for a Presidential Exemption for **two years** under Section 112(i)(4) of the Clean Air Act for **Craig Generating Station Units 2 and 3**, in Moffat County, Colorado. Specifically, Tri-State requests this exemption from the mandate under the **2024 Mercury and Air Toxics Standards ("MATS") Risk and Technology Review ("RTR") rule** for monitoring and demonstrating compliance with the revised filterable particulate matter ("fPM") standard using particulate matter continuous emissions monitoring systems ("PM CEMS") equipment.[1]

The Craig Generating Station is a coal-fired power plant in Moffatt County, Colorado, which is an attainment/unclassifiable area for all Criteria air pollutants. This request concerns two of the three coal-fired Electric Generating Units ("EGUs") at the plant, Unit 2 (410 MW) and Unit 3 (448 MW)[2]. The Craig EGUs have contemporary emission controls. To reduce particulate matter emissions by greater than 99%, each of the two units has a baghouse. To reduce sulfur dioxide emissions, Unit 2 is equipped with a limestone scrubber and Unit 3 is equipped with a lime spray-dryer. To reduce nitrogen oxide emissions, both units utilize low-NOx burners and overfire air; Unit 2 also includes selective catalytic reduction equipment and Unit 3 also utilizes Selective Non-Catalytic Reduction equipment. The plant

[1] *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, 89 Fed. Reg. 38,508 (May 7, 2024) ("2024 MATS RTR Rule"). MATS is codified at 40 C.F.R. Part 63, Subpart UUUUU. The RTR rule was challenged in court, *North Dakota v. EPA*, No. 24-1119 (D.C. Cir.), and is being reconsidered by EPA. *See* Mercury and Air Toxics Standards (MATS): Powering the Great American Comeback Fact Sheet. MATS is the regulation setting forth national hazardous air pollutant standards ("NESHAPs") for coal- and oil-fired electric utility steam generating units ("EGUs") under Section 112 of the Clean Air Act. The 2024 MATS RTR Rule revised the fPM standard, which is a surrogate for non-mercury metal Hazardous Air Pollutants ("HAPs"), reducing it to one-third of the current standard (from 0.030 lb/MMBtu to 0.010 lb/MMBtu), and also required the use of PM CEMS as the sole means of demonstrating compliance.

[2] Craig Station Unit 1 has a retirement date of December 31, 2025.

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

meets or surpasses all applicable emission limitations under the Clean Air Act, including the currently applicable (and the revised) fPM standard and other hazardous air pollutant NESHAPs under MATS.

As explained in more detail below, Craig Station will not be able to reliably and consistently comply with the revised requirement for PM CEMS monitoring for fPM because even though PM CEMS exist, they are not capable of showing compliance with the new lower limits. Tri-State requests a two-year Presidential Exemption, as provided in Section 112(i)(4) of the Clean Air Act.

The PM CEMS Technology Required Under the 2024 MATS RTR Rule Is Not Available.

Under the currently effective MATS regulations, Craig Station demonstrates compliance with the fPM standard using quarterly stack tests. These tests show, according to EPA's own 2024 rulemaking, that the baghouses at the plant are highly effective, resulting in a fPM emissions rate about an order of magnitude less than the current standard. Using PM CEMS for demonstrating compliance at Craig Station for the last decade (since MATS became effective) would have been a waste of money, given how much lower Craig Station emissions are than the standard. But the mandate of the 2024 MATS RTR Rule for all EGUs to use PM CEMS exclusively to demonstrate compliance presents a wholly different, and intractable, problem.

Specifically, many industry commenters filed comments in the 2024 rulemaking explaining that it is not technically feasible to use PM CEMS to demonstrate compliance with the extremely low fPM emission levels that would be required by the 2024 MATS RTR rule.[3] As Ralph L. Roberson, an engineer with more than 50 years of experience with the regulation and monitoring of emissions from EGUs and other facilities, explains in a technical memorandum, PM CEMS do not directly measure the amount of fPM particles in the flue gas but instead make indirect measurements to other criteria that require correlation to fPM to measure compliance. The very low standard adopted in the 2024 MATS RTR Rule would require that correlation be established over such a limited data range and at such low levels that it would be "virtually impossible" to establish a valid correlation of the PM CEMS.[4] In short, PM CEMS are practically unusable for the purpose EPA required in the 2024 MATS RTR Rule. In 2024, EPA rejected these comments in the final rule and forged ahead with a very low revised fPM standard and the requirement to use PM CEMS technology to demonstrate compliance. Craig Station Units 2 and 3 can meet the lower emission limit but cannot ensure compliance with the use of PM CEMS.

Notwithstanding EPA's decision in the final 2024 MATS RTR Rule, Tri-State's experience, Tri-State's internal experts, and experts for the industry at large all agree: PM CEMS are not an available technology to demonstrate compliance with a fPM standard at the level of 0.010 lb/MMBtu. For this

TRI-STATE

reason, "the technology to implement the revised fPM standard in the 2024 MATS RTR Rule is not available." *See* 42 U.S.C. § 7412(i)(4).

A Presidential Exemption for Craig Generating Station is in the National Security Interests of the United States.

The President of the United States has issued several Executive Orders making unmistakably clear that preserving the nation's electric generating capacity is in the national security interest of the United States. Most notably, Executive Order 14156, "Declaring a National Energy Emergency," recognizes that "[a]n affordable and reliable domestic supply of energy is a fundamental requirement for the national and economic security of any nation." The Executive Order defines "generation" to include "the use of energy to produce electricity," and the term "energy" to include "coal." Executive Order 14156 thus specifically identifies the preservation of the nation's electric generating capacity, including coal-fired generation, as vital for the national security of the United States.

Executive Order 14154, "Unleashing American Energy," says "[i]t is … in the national interest to unleash America's affordable and reliable energy and natural resources." In directing all federal agencies to review their actions, the Executive Order requires "particular attention to … coal," among other energy resources.

In Executive Order 14213, "Establishing the National Energy Dominance Council," the President establishes a council, the principal charge of which is to expand, not limit, the nation's production of energy.

Finally, Executive Order 14179, "Removing Barriers to American Leadership in Artificial Intelligence," explains that "[i]t is the policy of the United States to sustain and enhance America's global [Artificial Intelligence ("AI")] dominance in order to promote human flourishing, economic competitiveness, and **national security**." Although this order does not explicitly call out energy resources, it is closely related. AI systems require significant electric power — indeed, the rapid development of AI is largely driving ever increasing demand for electric power all over the United States not seen in decades.

Craig Station Units 2 and 3 are critical to fulfilling Tri-State's obligation to provide its membership reliable, affordable and secure electric power. Tri-State plans to retire Craig Unit 2 by September 30, 2028, and Craig Unit 3 by January 1, 2028. Tri-State also plans to construct a new dispatchable resource as part of a system adhering to industry-leading Level II reliability metrics. However, this will be accomplished only after the MATS compliance deadline for PM CEMS, which, even if installed, will not demonstrate compliance with the MATS requirements, as described above. Therefore, it is not in the national security interest of the United States to require Tri-State to add PM CEMS to Craig Station Units 2 and 3 for the limited time they will operate after July 7, 2027. Requiring the addition of PM CEMS to units that will be retired interferes with Tri-State's measured plans to ensure reliability metrics are met in a manner that best advances the national security interest.

FROM: Ralph L. Roberson, P.E.

DATE: June 16, 2023

SUBJECT: Technical Comments on EPA's Proposed Rule: Mercury and Air Toxics Standards Risks and Technology Review – PM CEMS

INTRODUCTION

Recently, the Environmental Protection Agency (EPA) proposed revisions to the Agency's Mercury and Air Toxics Standards (MATS) rule.[1] These revisions are the proposed response of EPA to its previously announced review of its 2020 Risks and Technology and Review (RTR).[2] Among other things, EPA proposes to eliminate the quarterly stack testing option for demonstrating compliance with the filterable particulate matter (fPM) emission standard. If EPA finalizes the rule as proposed, the only compliance option for fPM will be with a PM continuous emission monitoring system (CEMS). Compliance with the proposed emission standard of 0.010 lb/10^6 Btu will be based on 30-day rolling averages computed from hourly PM CEMS data.

The National Rural Electric Cooperative Association (NRECA) asked RLR Consulting LLC (RLR) to review EPA's proposed rule and to assist in preparing technical comments. NRECA asked RLR to focus its effort on the EPA requirement to mandate the use of PM CEMS to demonstrate compliance with the revised fPM emission standard.

REGULATORY DISCUSSION

Section 112(f) of the Clean Air Act (CAA) states, among other things, "if standards promulgated pursuant to subsection (d) and applicable to a category or subcategory of sources emitting a pollutant (or pollutants) classified as a known, probable or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than one in one million, the Administrator shall promulgate standards under this subsection for such category." Then, Section 112(d)(6) requires EPA to "review and revise as necessary

[1] 88 Fed. Reg. 24,854 (April 24, 2023).
[2] 87 Fed. Reg. 7,624 (February 9, 2022).

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

(taking into account developments in practices, processes, and control technologies), emission standards promulgated under this section no less often than every 8 years." Taken together, these two provisions of the CAA constitute what is termed EPA's Risk and Technology Reviews (RTR). Clearly, Section 112(f) is concerned with health risks and has nothing to do with compliance methods or procedures. Section 112(d)(6) concerns itself with revising numerical standards based on "developments in practices, processes, and control technologies." Thus, there appears to be no legal basis for EPA's proposed elimination of the quarterly stack testing option for demonstrating compliance with the fPM emission standard.

TECHNICAL DISCUSSIONS

The fundamental problem with PM CEMS is, and always has been, an issue of technology. That is, commercially available PM CEMS do not provide a direct measure of PM emissions. By direct measure, we mean that the instrument measures the mass of PM and the volume of flue gas from which that mass of PM was sampled. Rather, commercially available PM CEMS measure some property (i.e., light scatter or beta attenuation[3]) that must be correlated to actual stack PM measurements.

Correlation Testing and Data Range

The procedure and requirements for correlation testing are specified in EPA Performance Specification 11 (PS-11).[4] PS-11 requires a minimum of 15 test runs using the appropriate EPA reference method (e.g., MATS Method 5) spaced over three distinct PM concentrations (i.e., low, mid and high).[5] For the resulting correlation to be useful, these three distinct PM concentrations should span the range of expected concentrations with a target level (i.e., 50 percent of the limit) in the middle of the range.

A PM CEMS correlation curve plots the PM CEMS output on the x-axis and the reference method PM concentration on the y-axis. Reference method PM concentrations (y-axis) are typically expressed in the units of milligrams per actual cubic meter (mg/acm), and "actual" refers to the condition at which the PM CEMS detector operates. EPA is proposing to lower the filterable PM emission limit from 0.030 to 0.010 lb/10^6 Btu.[6] Conversion of 0.010 lb/10^6 Btu to mg/acm requires knowledge of the detector temperature and stack diluent (e.g., CO_2) concentration. If we use a typical CO_2 concentration of 12.5 percent (wet) and a detector temperature of 320 ° F, then 0.010 lb/10^6 Btu converts to 7.5 mg/acm. Following EPA's assumption that the unit will

[3] The EPA statement at 88 Fed. Reg. at 24,872, that a beta gauge "detector measures the amount of radiation emitted by the sample" is categorically incorrect and illustrative of several uninformed statements (e.g., cost estimates) about PM CEMS in the preamble to the proposed rule.
[4] 40 C.F.R. 60, Appendix B.
[5] PS-11 defines "low" to be zero to 50 percent of the maximum PM concentration; "mid" to be 25 to 75 percent of the maximum PM concentration; and "high" to be 50 to 100 percent of the maximum PM concentration. RLR's many years of experience with PM CEMS correlation testing is to equate "maximum PM concentration" with the PM emission limit.
[6] 88 Fed. Reg. at 24,857.

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

operate at the "target compliance level," which is 50 percent of the emission limit, (0.005 lb/10^6 Btu) we then have a unit operating at 3.75 mg/acm with an equivalent emission limit of 7.5 mg/acm. Not only will it be virtually impossible to conduct correlation testing at three PM concentrations (low, mid and high), it is far from clear that any type of valid PM CEM correlation can be established over such a limited data range. Using 7.5 mg/acm as the emission limit: low becomes 0 to 3.75 mg/acm; mid is 1.88 to 5.63; and high is 3.75 to 7.5 mg/acm. Anyone who believes he or she can regulate and control PM emissions from a coal-fired EGU that precisely has never set foot in such a facility. If EPA finalizes the MATS fPM limit to 0.010 lb/10^6 Btu, there is a much stronger technical argument to eliminate PM CEMS as a compliance option altogether and rely on quarterly stack testing with longer run times for all EGUs.

EPA states that 3-hr stack testing runs are the solution to minimizing both costs and uncertainty associated with the proposed lower fPM emission limit. While 3-hr testing runs may be acceptable for a standard compliance test that consists of three independent test runs, it is quite unreasonable for either PS-11 initial correlation tests and/or response correlation audits (RCAs). As noted above, PS-11 correlation testing requires a minimum of 15 runs and allows the owner/operator to discard up to five runs to improve correlations. Thus, it is not unusual to conduct 20 test runs for the PS-11 initial correlation test. [7]

A 20-run test program with 3-hr test runs will require on the order of 2 weeks. This is an excessive amount of time to take a unit off dispatch and hold constant load conditions for the sake of testing. How ironic it would be to displace renewable generation with a coal-fired EGU for 2 weeks simply to complete EPA-required testing. The increase in stack testing cost will be significant. [8] Granted, longer test runs improve Method 5 accuracy at low PM concentrations. However, longer test runs will neither expand the range of the data nor the quality of the resulting PM CEMS correlations. The range of the data will be limited even with longer test runs, and the robustness on any resulting correlation will be questionable.

Portland Cement Argument

EPA acknowledges that in the 2012 Portland Cement rulemaking, the Agency was aware of the difficulty in using PM CEMS to demonstrate compliance with a fPM emission limit in the range of 5 to 8 mg/dscm.[9] In the MATS RTR proposal, EPA attempts to dismiss comparisons to the Portland Cement rule by asserting that the particle characteristics between the two source categories are different. We agree that the particle

[7] The RCA requires a minimum of 12 individual runs, and also allows owners/operators to discard up to five runs. Thus, 17 individual runs are often performed for an RCA.
[8] RLR Consulting obtained a budgetary cost estimate of $80,000 for conducting PS-11 correlation test with the proposed sample volume requirement of 4 dscm. The budgetary estimate is $30,000 for conducting PS-11 correlation test under the current MATS requirements.
[9] The Portland Cement fPM emission limit is expressed in the units of pounds of particulate per ton of clinker produced. Thus, the conversion to PM concentration (mg/dscm) is not exact but depends on plant-specific parameters.

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

characteristics may indeed be different; however, 5 to 8 mg/dscm is a low PM concentration regardless of the size, shape, or constituency of the particles.

EPA addressed its concerns in the Portland Cement rule by (1) increasing the emission limit to a range of 7 to 14 mg/dscm, and (2) no longer requiring PM CEMS to demonstrate compliance with the emission limit. If the real problem were, as EPA now claims, (i.e., 1-hr test runs "led to inherent measurement uncertainty"), we initially wondered why EPA did not simply increase the run times as the Agency is proposing to do in the MATS rule? Further research reveals that EPA did examine the effect of longer run times in 2012 Portland Cement rule. However, EPA recognized then that longer run times would not solve the problem created by a very limited data range for the correlation testing associated with a very low emission limit.[10] The Agency correctly concluded that reference method measurement uncertainty coupled with a limited data range would make establishing a meaningful PM CEMS correlation curve next to impossible.

As noted earlier, PS-11 specifies the correlation requirements that are applicable to PM CEMS. To satisfy PS-11, the PM CEMS correlation must meet the following statistical criteria:

- The correlation coefficient shall be > 0.85.
- The confidence interval (95%) half range at the median PM CEMS response value must be within 10% of the PM emission limit value. [11]
- The tolerance interval half range at the median PM CEMS response value must have 95% confidence that 75% of all possible values are within 25% of the PM emission limit value.

These PS-11 statistical considerations coupled with the low proposed emission limit clearly played a role in EPA's final decision to forego PM CEMS in the Portland Cement rulemaking. In the final Cement rule, EPA states[12]

> A particular challenge in applying PM CEMS to source emissions monitoring is in measuring the very low PM concentrations associated with a low applicable emissions limit for PM precisely enough to meet the PS 11 correlation requirements. In addition to measurement uncertainty inherent in PM CEMS data, the measurement uncertainty associated with the reference test method (e.g., Method 5) is a significant contributor to successful development of a PM CEMS correlation regardless of the type of PM CEMS used.

[10] 77 Fed. Reg. 42,368, 42374 (July 18, 2023).
[11] PS-11 states that the points at which the confidence interval and tolerance interval half ranges are evaluated are a function of the form of the regression equation. For linear and logarithmic correlations, the half intervals are evaluated at the mean PM CEMS response.
[12] 77 Fed. Reg. at 42,374.

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

As noted above, PS 11 specifies acceptable criteria for a correlation directly related to the applicable emissions limit. If we use 7.5 mg/acm for EPA's proposed fPM limit of 0.010 lb/10^6 Btu,[13] the 95% confidence interval would have to be less than or equal to 0.75 mg/acm. Likewise, the tolerance interval would have to be less than or equal to 1.88 mg/acm. We are not aware of any data or technical support that any commercially available PM CEMS is capable of meeting these very tight confidence and tolerance intervals, and EPA cites none. Adding to the challenge of achieving these strict confidence and tolerance intervals is the fact that these intervals will be at or near the method detection limit of the EPA Method 5, even with extended run times. While PS-11 ascribes all of the measurement errors to the PM CEMS, variability in reference method measurements at these low PM concentrations will likely result in numerous PS-11 failures.

PM CEMS and New EGUs

EPA appears to dismiss concerns with PM CEMS measurements at the low PM concentrations that would be required by the proposed emission standard (0.010 lb/10^6 Btu) by stating: (1) PM CEMS are mandated for new EGUs and (2) the revised fPM emission standards for existing EGUs and the fPM for new EGUs are approximately the same (0.010 lb/10^6 Btu v. 0.090 lb/MWh).[14] We have two issues with EPA's use of new EGUs to support PM CEMS at low concentrations.

Assuming PM CEMS are required for new EGUs, EPA's claim is without merit because PM CEMS are not and have never been demonstrated on new EGUs. The reality is there are no new EGUs in operation, and there is never likely to be one. Apparently, EPA agrees because in the Agency's recently signed proposed rule for controlling greenhouse gas emissions from the power sector, EPA explains not revising the NSPS for newly constructed fossil-fuel-fired steam generating units with the following sentence: "[t]his is because the EPA does not anticipate that any such units will construct or reconstruct and is unaware of plans by any companies to construct or reconstruct a new coal-fired EGU."[15] Supporting the proposed use of PM CEMS at low fPM concentrations by stating the requirement is consistent with a theoretical requirement for new EGUs that have not been built and will never be built is no support at all.

Discussion of PM CEMS Costs

EPA's statement, "not all EGU owners or operators chose the most cost-effective means of demonstrating compliance with the fPM emission limits"[16] is as insulting as it is incorrect. In 2015, we were asked by an EGU owner to estimate the cost over a 10-year

[13] Base on a stack CO_2 concentration of 12.5% (wet basis) and a PM CEMS detector temperature of 320 ° F.
[14] For the MATS rule, a new EGU is defined as one that commenced construction after May 3, 2011.
[15] 88 Fed. Reg. 33,245 (May 23, 2023).
[16] 88 Fed. Reg. 24,872 (April 24, 2023).

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

period of demonstrating compliance with the MATS fPM emission limit based on (1) quarterly stack testing and (2) PM CEMS. For stack testing, we estimated a total cost of $260,000 (i.e., 10 yr. x 4 quarters x $6,500). The 10-year cost for PM CEMS was $479,500. The PM CEMS estimate included $90,000 capital (representative of an extractive light scatter instrument), $35,000 for initial PS-11 correlation test, $90,000 for three response correlation audits (RCA), $45,500 for seven relative response audits (RRA), and about $20,000 per year for routine maintenance and spare parts. Note that our PM CEMS estimate did not include the cost of three PM spiking events, which would significantly increase the cost of the PM CEMS option. Also, neither cost estimate assumed 3-hr test runs. Longer test runs will increase the cost of quarterly stack tests; however, we believe the cost increase would be greater for PM CEMS because so many more test runs are involved.

We also disagree with EPA statements regarding stack testing costs. EPA states, "annual cost for M5 testing with 3 hour run duration is estimated to be $85,127 ($82,000 for testing, and $3,127 for 24 hours of site technical support); quarterly testing using M5I with runs of similar duration is estimated to be $107,127."[17] RLR obtained a cost estimate of $38,000 from a stack testing company to conduct four quarterly stack tests and collect a minimum sample volume of 4 dscm for each run. EPA digs a deeper hole with its absurd M5I annual estimate of $107,127. As a threshold matter, M5I is not allowed under the MATS rule because M5I specifies a probe and filter temperature of 250 ° F whereas the MATS rule requires a probe and filter temperature of 320 ° F. Assuming EPA were to correct this technical oversite, EPA could never explain how M5I testing would or should cost $22,000 more per year than M5 testing. In other words, EPA grossly inflates its stack testing cost estimates in attempting to make PM CEMS appear more palatable.

Qualitative Aerosol Generator

EPA is correct in stating that for several years the Electric Power Research Institute (EPRI) funded research associated with the development of the Qualitative Aerosol Generator (QAG). The QAG could generate particles of uniform size distribution at precisely known concentrations. The QAG contained components (i.e., mass flow meter) whose calibrations were traceable to the National Institute of Standards and Technology (NIST). However, it was never clear whether the PM aerosol concentration could be shown to be "NIST traceable."

More importantly, EPRI ceased funding QAG research circa 2018. Among the reasons for stopping the research were (1) the field tests had become increasingly complex and expensive and (2) utility-funders lost interest primarily because of EPA's lack of response despite several attempts by EPRI to get EPA involved in a project that sought to make PM CEMS correlations more efficient. We find it incredulous that EPA would dredge up an EPRI project that the Agency never showed any support for and attempt to use that defunct project to support this rulemaking proposal.

Docusign Envelope ID: E9ADD7F2-A19C-4404-A5BD-657D12ADCD16

EPA Random Error Memo

EPA states that the impact of sampling times and random errors on measurable emission limits is described in a memorandum in the docket.[18] The Memorandum statement, "2 mg/dscm for a one-hour test run (which is equivalent to a mass per heat input value of 0.0082 lb/mmBtu)," is simply incorrect. A fPM concentration of 2 mg/dscm is approximately 0.0021 lb/10^6 Btu assuming nominal CO_2 concentration of 10.5 % (dry).

The following Memorandum statement "one can calculate the range of the contribution of random error to the total PM CEMS tolerance to be between thirty-six and seventy-three percent" may or may not be incorrect. The Memorandum provides neither a reference nor a method for how random error is defined or calculated. Likewise, there are no text or equations to support the results shown in Table 1. Frankly, the Agency should be embarrassed to include in a rulemaking docket a 2-page Memorandum that is so poorly explained or substantiated.

CONCLUSIONS

First, RLR is not certain the RTR process affords EPA the latitude to make changes to compliance determination procedures. However, as discussed above, the technical justification for mandating PM CEMS, especially if EPA were to lower significantly the fPM standard (as it currently has proposed) is deeply flawed and fraught with several incorrect or inaccurate statements, both concerning the ability to obtain meaningful correlations over a limited data range and the cost of PM CEMS. Thus, for the reasons explained in this memorandum, EPA would be well advised to maintain the quarterly stack testing option for fPM in its MATS rule. Moreover, if EPA were to lower the fPM limit to 0.01 lb/10^6 Btu, EPA should follow the precedent the Agency set in the Portland Cement rule and withdraw PM CEMS as a compliance testing option. Periodic, quality stack tests will be a much better indicator of compliance than continuous data of questionable quality.

If you have any questions regarding our technical comments or require additional information, please do not hesitate to contact me (919) 696-7008 or rlph.robertson@gmail.com.

Re: Presidential Exemption, National Emissions Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review (89 FR 38508; May 7, 2024) (MATS Rule), for City Water, Light and Power – Dallman Unit 4

Dear Administrator Zeldin:

City Water, Light and Power (CWLP) is a municipally owned utility serving the City of Springfield, Illinois. Dallman Unit 4, commissioned in 2009, is CWLP's newest coal-fired generating unit and is equipped with state-of-the-art air pollution control technologies. The unit plays a vital role in Springfield's electricity supply and regional grid reliability through its participation in the Midwest Independent System Operator (MISO).

On May 7, 2024, the U.S. Environmental Protection Agency (EPA) published the final rule entitled "National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Review of the Residual Risk and Technology Review" (89 FR 38508). This rule formally eliminated the Filterable Particulate Matter Low Emitting Electric Generating Unit (FPM LEE) designation formerly achieved by demonstrating emissions rates at or below 50% of the 0.030 lb/mmBtu standard over a three-year period. This in effect mandated continuous Filterable Particulate Matter emissions monitoring (FPM CEMS) for compliance.

On April 8, 2025, President Donald J. Trump issued a proclamation under Section 112(i)(4) of the Clean Air Act entitled "Regulatory Relief for Certain Stationary Sources to Promote American Energy." This action authorized a two-year exemption for selected coal-fired units, citing national security, economic hardship, and technological limitations as justification. Dallman Unit 4 is not among those units exempted in Annex I Stationary Sources List as

ED_021114A_00009236-00001

published on April 15, 2025. CWLP respectfully submits this request for an individual exemption under the same statutory authority or for inclusion on the Annex I list.

EPA Administrator Lee Zeldin has also announced plans to reconsider the Biden-era MATS revisions, citing excessive economic impacts and pending legal challenges from 23 states. These developments further support CWLP's pursuit of near-term regulatory flexibility while national energy and environmental policy is reassessed.

The May 2024 final MATS rule eliminated the FPM LEE designation and mandated continuous emissions monitoring (FPM CEMS). Dallman Unit 4 previously qualified as an FPM LEE, consistently achieving PM levels well below regulatory thresholds. Recent vendor outreach has shown the difficulty in obtaining retrofit or new systems to monitor PM for units such as Dallman Unit 4. Also, broadly speaking and in alignment with the American Public Power Association (APPA), CWLP affirms that no new control technologies have emerged to justify the revised compliance framework of the final rule.

Dallman Unit 4 has consistently demonstrated filterable particulate matter emissions well below both the original and revised MATS thresholds. Under the prior standard, the emissions limit for FPM was 0.030 lb/mmBtu. The May 2024 final rule significantly tightened this limit to 0.010 lb/MMBtu—a two-thirds reduction.

Across multiple stack tests conducted between 2020 and 2024, Dallman Unit 4 has recorded emissions as low as 0.00025 lb/mmBtu and has consistently remained below 0.0009 lb/mmBtu. These levels are not only well under the previous limit but are also substantially below the revised standard, underscoring the unit's exceptional performance and continued eligibility—on a technical basis—for a low-emitting designation.

Dallman Unit 4 plays a critical role in maintaining regional electric reliability in central Illinois and throughout MISO. The unit is relied upon to support voltage stability, fulfill reserve margin commitments, and provide flexible baseload generation.

Electric load forecasts for the region project significant increases over the coming decade, largely driven by electrification trends, industrial development, and the expansion of energy-intensive data centers. These demands will place added pressure on grid operators to maintain resource adequacy and resilience.

President Trump's Executive Order 14154, "Unleashing American Energy," and the accompanying Presidential Proclamation on Regulatory Relief underscore the administration's view that continued operation of existing coal generation assets is a national security imperative. The regulatory burdens imposed by the regulations such as the revised MATS rule risk accelerating unit retirements at a time when resource adequacy is already strained, as system

operators such as PJM and MISO have affirmed. Curtailing Dallman Unit 4 would undermine both local reliability and broader grid resilience objectives.

A two-year exemption under CAA §112(i)(4) will help ensure that Dallman Unit 4 remains online to meet near-term energy security needs while EPA reconsiders the 2024 final rule and grid reliability challenges are addressed.

In light of the unavailability of proven technologies, the economic hardship imposed by the revised rule, and Dallman Unit 4's critical role in maintaining energy security and reliability, CWLP respectfully requests that EPA grant a two-year exemption from the compliance requirements of the 2024 MATS revision for this unit. This request is submitted under Section 112(i)(4) of the Clean Air Act and in accordance with EPA's March 2025 solicitation for Presidential Exemption applications.

This request aligns with the April 2025 Presidential Proclamation granting a blanket exemption to similarly situated coal-fired generating units and is consistent with CWLP's historical performance, technological configuration, and public interest mission. Dallman Unit 4 is not included in the list of nationally exempted units, CWLP seeks an individual exemption based on parity and the distinct regulatory and operational burdens faced by public power entities or for the inclusion of the unit in the Annex I Stationary Sources List. CWLP intends to maintain all other MATS-related controls and monitoring obligations during the exemption period.

CWLP is committed to public health, transparency, and environmental stewardship. We welcome continued dialogue with EPA staff and stand ready to work collaboratively on long-term emissions compliance strategies and energy security goals.

Respectfully submitted,

P.J. Becker
Environmental, Health & Safety Manager
City Water, Light and Power
Springfield, Illinois

Re: Presidential Exemption: National Emission Standards for Hazardous Air Pollutants: New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry, 89 FR 42932 (HON Rule).: LION Elastomers 1615 Main St. Port Neches, Texas, 77651.

Dear Administrator, Zeldin:

Lion Elastomers is located at 1615 Main St. Port Neches, Texas, 77651. In accordance with Section 112(i)(4) of the CAA, Lion respectfully requests a two-year Presidential Exemption from the New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry, 89 FR 42932 (HON NESHAP Rule).

The Emissions Standards or Limitations Subject to the Request:

National Emission Standards for Hazardous Air Pollutants: New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry, 89 FR 42932 (HON Rule) (May 16. 2024). The limitations that are the main subject of this exemption request include the installation of system set up of nearly 14 new fenceline monitors, the installation of a calorimeter or gas chromatography onto the flare vent, and subject adjustments in the LDAR system.

Exemption Period Request:

LION Elastomers is requesting a two-year Presidential Exemption and extension of the applicable compliance deadlines of the New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic

Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry, 89 FR 42932 (HON Rule) (May. 16, 2024).

Background

1. History of site and economic contribution

The Lion Elastomers Port Neches plant was constructed by "Reconstruction Finance Corporation" an agency of the Federal Government in 1942 as part of the WW2 war effort. Following the attack on Pearl Harbor the Malaysian rubber supply was cut off from the US.

The plant was constructed in 9 months. It plant was initially owned by the US Government and operated by BF Goodrich and Firestone. The plant has since been owned by Uniroyal, Texaco, BF Goodrich, Ameripol Synpol, ISP Synthetic Elastomers, Ashland and Lion Elastomers. The site is a major domestic supplier of synthetic rubber to the tire industry and to numerous other critical uses including agriculture, medical, food preparation, etc.

In recent years, the United States has seen manufacturing and economic challenges with the production of Synthetic rubber. This has put a strain on the domestic industry… a strain that Lion Elastomers is still recovering from. As a result of these challenges, the company capacity utilization has dropped nearly 20% in recent few years, a worsening chance of degradation in facilities and thus a strain for domestic supply goods and national security ensuing.

2. Site certification and compliance

The site is a major domestic supplier of synthetic rubber to the tire industry and to numerous other critical uses including agriculture, medical, food preparation, etc. The plant is ISO14001 Certified and belongs to a local Community Advisory Pannel.

In 1996 the Port Neches area was added to the TCEQ Air Pollutant Watch List. An area monitor was set up to monitor butadiene concentrations. In 2009 due to emissions reductions by the rubber plant and neighboring plants, the Port Neches are awas removed from the APLW.

Presidential Exemption Request

1. Impact on Lion Elastomers
    a. The May16th, 2024, HON NESHAP Rule presents many technological, engineering and business challenges for LION Elastomers. The first three options for Lion Elastomers compliance with the HON NESHAP Rule — product disruptions, capacity reductions, and production are problematic for the domestic and national security reasons discussed below.

        i. Difficulty Meeting Deadline Coupled with Uncertainty

LION ELASTOMERS

Technologies that the HON Rule relies on are impractically available and are monetarily burdensome. Cost for implementation will necessarily cause domestic producers to consider moving production overseas. Due to the increased cost of HON compliance, producers of end use rubber products will also consider overseas supply, impairing the United States ability to respond effectively in a time of crisis.

ii The HON Rule imposes a substantial burden on Lion Elastomers with very little environmental benefit.

Lion has been in full compliance with the HON Polymers and Resins MACT U regulations since the regulation was enacted in 2001. Lion has also operated a continuous gas chromatograph fence line monitor in place for approximately 30 years, monitoring emissions of hazardous air pollutants. An additional local emissions monitoring station in Port Neches (operated by Southeast Texas Regional Planning Commission) has seen a significant reduction in HAP emissions over the years.

b Lion Elastomer's Process Controls Are Already Highly Effective. The two-year extension to the fenceline monitoring requirement is appropriate for Lion in part due to the low levels of 1,3-butadine emitted annually.

2. Challenges Presented by the HON NESHAP Rule

a As of July 15th, 2026, the presidential declaration concerning the Regulatory relief for certain stationary sourced to promote American chemical Manufacturing security recognizes and acknowledges that HON imposes substantial burdens on chemical manufacturers and the HON compliance relying on technology that is not practically available.

i Additionally, the actions needed to start the new HON compliance are strongly dependent on shutdown and large capital investments. Which will affect the domestic production of necessary materials that Lion Elastomers contributes to.

3. National Security Implications of Compliance with the HON NESHAP Rule

a) Lion Elastomers Port Neches plant is a reliable domestic producer of synthetic rubber which is an essential component in numerous products supporting domestic and military equipment. Synthetic rubber is a critical component of automobiles, tires, farm equipment, aircraft, military tanks, food preparation, medical equipment, personal protective equipment, sports equipment and numerous other purposes.

b) The Port Neches facility was planned, constructed, and operated as a government component following the attack of Pearl Harbor in 1942. The United States of America needed the ability to make rubber domestically as 90% of rubber was cut off from foreign suppliers. Not only did

Styrene-Butadiene Rubber (SBR) assist in the war effort, it also was a large contributor to the community economically, supplying jobs during construction, during the war, and continuing therefore after.

c) Once again, the Unites states largely depends on rubber from foreign rubber plants. With the potential need of shutting down or reducing production to obtain compliance with the NESHAP HON rule…this would likely have a negative effect on 'safeguarding the supply chains that underpin our economy and to [reduce] the Nation's dependance on foreign control over materials critical to national resilience." (Trump, 2025).

Conclusion

Attempting to comply with the new Rule would result in potential manufacturing shutdowns, product shortages, and capacity reductions. This would negatively impact national security by affecting U.S. military and millions of American civilians of which all are dependent on rubber in their everyday lives. We have learned from the past that America needs domestic rubber. Let's ensure that we learn from previous examples of national preparedness and do not reduce domestic production at a time that "adversaries expand influence over key inputs" (Trump, 2025).

As explained herein, Lion submits a timely request for a two-year extension to the compliance deadlines applicable specifically to:

1. Fenceline monitoring work practice standards for the SOCMI and P&R I source categories, requiring owners and operators to monitor for six specific HAP (i.e. benzene, 1,3-butadiene, ethylene dichloride, vinyl chloride, ethylene oxide and chloroprene) if their affected source uses, produces, stores or emits any of them, and to conduct root cause analysis and corrective action upon exceeding the annual average concentration action level set forth for each HAP. (40 CFR 63.184 and 40 CFR 63.502)

   a) Lion will be required to perform fenceline monitoring for one pollutant, which will further complicate the site's monitoring plan to address different chemicals from differing facilities due to proximity of nearby sources. Lion may be required to make physical changes to the fence line to be able to site and service the monitoring stations.

2. Monitoring and operational requirements for flares to ensure HON and P&R I flares meet MACT standards at all times when controlling HAP emissions. (40 CFR 63.108 and 40 CFR 63.508)
   a. The extension to the additional flare monitoring requirements is appropriate for Lion to allow the time necessary to identify and contract third-party experts to help implement and manage various aspects of the rule. These contractors must possess specialized expertise which greatly narrows the pool of available contractor candidates. Equipment availability for items such as calorimeters and control system upgrade components is also a potential bottleneck to the implementation due to the large number of impacted sources in the state of Texas and Louisiana.

LION ELASTOMERS

RE: Request for Two-Year Presidential Exemption: New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants (NESHAP) for the Synthetic Organic Chemical Manufacturing Industry (SOCMI) Industry
Enterprise Products Operating LLC
Mont Belvieu Complex

To Whom It May Concern,

Enterprise Products Operating LLC (Enterprise) hereby requests a two-year exemption from the compliance obligations of the New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants (NESHAP) for the Synthetic Organic Chemical Manufacturing Industry (SOCMI) Industry (collectively referred to as the HON Rule)[1] for the Mont Belvieu Complex located in Mont Belvieu, Chambers County, Texas. Enterprise Products manufactures multiple products, which are vital building blocks to our economy. For the reasons highlighted in this letter, we believe it is necessary and appropriate for the President to grant an exemption under Clean Air Act (CAA) Section 112(i)(4) like that provided in the July 17, 2025 Presidential Proclamation for Regulatory Relief for Certain Stationary Sources to Promote American Chemical Manufacturing Security[2].

As previously considered by the Administration, we urge for the swift issuance of an exemption based on an understanding that both: 1) "availability" for the purposes of this consideration refers not only to the existence of technology capable of achieving compliance with the rule, but encompasses practical challenges with the timeframes necessary to plan, procure, and install required technologies and such activity cannot occur within the current compliance timeframe; and 2) national security encompasses not only military defense applications and infrastructure, but also economic security, a perspective that has been acknowledged by the President in Executive Orders and key security agencies like the Department of Defense.

We believe that the Administration has already been provided with sufficient information to support an exemption covering all regulated facilities, including but not limited to the Mont Belvieu Complex. This information includes prior comments and the underlying petition for reconsideration on the HON rule, and the information provided in the March 31, 2025 letter to the EPA submitted jointly by

[1] National Emissions Standards for Hazardous Air Pollutants (NESHAP), Powering the Great American Comeback https://www.epa.gov/system/files/documents/2025-03/neshap_powering-the-great-american-comeback_fact-sheet_2.pdf 89 Fed. Reg. 42932 (May 16, 2024).
[2] https://www.whitehouse.gov/presidential-actions/2025/07/regulatory-relief-for-certain-stationary-sources-to-promote-american-chemical-manufacturing-security/

P.O. BOX 4324

www.enterpriseproducts.com

the American Chemistry Council (ACC) and the American Fuel & Petrochemicals Manufacturers (AFPM).

This letter provides additional detail and support on the critical nature of the request for relief and to address EPA's request for information. The Mont Belvieu Complex is subject to numerous provisions of the HON residual Risk and Technology Review (RTR) rule changes including, but not limited to the following:

- Flares - new operational and monitoring requirements;
- Fenceline Monitoring for Benzene and 1,3 Butadiene;
- Heat exchange systems requirements Modified El Paso Method with 6.2 ppmv leak action level;
- Chlorinated process vents – new dioxins and furans emission standard of 0.054 ng/dscm;
- Removal of Startup, Shutdown, and Malfunction (SSM) Provisions and updates to bypass provisions;
- Maintenance vents and tank degassing – new work practice standards; and
- Pressure Relief Devices (PRD) standards – new monitoring with an immediate release notification, requiring three redundant safeguards, root cause analysis/corrective actions for releases, and release prohibitions for repeat events.

To meet these requirements, Enterprise may be required to install new, or modify existing, closed vent systems, control devices, monitoring equipment, and develop new standard operating procedures, recordkeeping templates, and reporting methodologies. In addition to conducting engineering design, assessing emissions controls, and evaluating and implementing new fenceline monitoring requirements, Enterprise must obtain appropriate air permit authorizations. With this understanding, two years is not enough time to conduct the activities that are required to comply with these new requirements. Furthermore, Enterprise has concerns related to fenceline monitoring, PRDs, and real-time sampling that are required to ensure compliance with the fenceline monitoring requirements.

To gain additional time and to avoid potential facility shutdowns, imperiling jobs, and threatening supply chains for a vital chemical building block critical to our national security, Enterprise is hereby requests a two-year exemption from the compliance obligations of the HON RTR requirements.

Enterprise Products Operating LLC appreciates this opportunity to request a two-year compliance extension for the Mont Belvieu Complex. If you have any questions or concerns, please contact Chris Benton, Senior Field Environmental Manager at (832) 501-4078 or via email at crbenton@eprod.com.

Thank you,

Jon E. Fields
Director, Field Environmental

Inquiry –

My name is Andrea Nejman and I'm a producer for *Spotlight on America.*

I'm following up on the email portal set up for requests for exemption to the HON rule, including EtO emissions – using the address "[redacted]".

Please answer the following questions before our deadline of July 1st:

- Have any exemptions been granted to companies as of now?
    - If so, which companies have been granted the exemptions to the HON rule and on what grounds? Please provide documentation.
- If exemptions are still being considered, please provide a timeline for when those decisions will be made.

Response -
Section 112(i)(4) specifically states that the President may exempt any stationary source "if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." This is an authority that solely rests with the President, not EPA.

Any further questions on this process or the status of exemptions should be directed to the White House.

Respectfully,

Subject: Rep. Luttrell - Huntsman HON Rule

Hi Air Team,

I wanted to flag this request for you from Rep. Luttrell.

> "Hope you are well! Huntsman who has a facility in our district applied for a Presidential Exemption under the Clean Air Act to provide relief imposed by a 2024 EPA rule known as the HON Rule. The administration included it on a short list of regulations to be evaluated for Presidential Exemptions.
>
> Huntsman applied for an exemption for a few of their facilities, including in Conroe, TX which is in our district. It is our understanding that the exemption process is being handled by the National Energy Dominance Council (NEDC). We wanted to see if there's an update you all can share regarding the status. Any guidance is helpful!"

Is there any update we would be able to give them or is it not possible at this time?

Best,
Parker

Good afternoon, [redacted]

Thanks for sending along the response. We appreciate being directed to the 5 proclamations announcing the companies that received EPA exemptions.

Can you also provide a list of companies from within TN-09 (or the entire state of Tennessee if that is easier) who *requested* exemptions, along with the corresponding information that Administrator Zeldin suggested should accompany the requests:

- any emissions standards or limitations subject to the request, facility(ies) and/or affected sources
- the length of the compliance period being requested
- explanation why the technology to implement the standard is not available, and
- explanation why an extension is in the national security interests of the United States

This information was requested in Congressman Cohen's letter, which I've attached for easy reference, but was not included in the response.

ASSISTANT ADMINISTRATOR FOR AIR AND RADIATION

WASHINGTON, D.C. 20460

December 22, 2025

The Honorable Steve Daines
United States Senate
Washington, D.C. 20510

Dear Senator Daines:

Thank you for your March 31, 2025, letter to the U.S. Environmental Protection Agency (EPA) in support of NorthWestern Energy and Talen Montana's request for a two-year Presidential Exemption from the "National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review" (MATS Rule).

On April 8, 2025, President Trump signed a Proclamation exempting certain coal stationary sources, identified in Annex I of the Proclamation, from compliance with the final rule titled "National Emissions Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review" 89 FR 38508 (May 27, 2024) (Mercury and Air Toxics Standards (MATS) Rule).[1] The White House subsequently transmitted Annex 1 to EPA to inform EPA which stationary sources are covered. NorthWestern Energy and Talen Montana's Colstrip Steam Electric Station Units 3 and 4 were listed in Annex 1 and have been exempted from the MATS Rule.

On July 17, 2025, President Trump signed four more Proclamations exempting additional stationary sources from compliance with several EPA final rules.[2] Specifically, in addition to exempting several

[1] The White House, "REGULATORY RELIEF FOR CERTAIN STATIONARY SOURCES TO PROMOTE AMERICAN ENERGY," available at https ://www.whitehouse.gov/presidential-actions/2025/04/regulatory-relief-for-certain-stationary-sources-to-promote-american-energy (April 8, 2025).

[2] The White House, "REGULATORY RELIEF FOR CERTAIN STATIONARY SOURCES TO PROMOTE AMERICAN SECURITY WITH RESPECT TO STERILE MEDICAL EQUIPMENT," https://www.whitehouse.gov/presidential-actions/2025/07 /regulatory-relief-for-certain-stationary-sources-to-promote-american-security-with-respect-to-sterile-medical-equipment/ (July 17, 2025); The White House, "REGULATORY RELIEF FOR CERTAIN STATIONARY SOURCES TO FURTHER PROMOTE AMERICAN ENERGY," https://www.whitehouse.gov/presidential-actions/2025/07 /regulatory-relief-for-certain-stationary-sources-to-further-promote-american-energy / (July 17, 2025); The White House "REGULATORY RELIEF FOR CERTAIN STATIONARY SOURCES TO PROMOTE AMERICAN CHEMICAL MANUFACTURING SECURITY," https://www.whitehouse.gov/presidential-actions/2025/07 /regulatory-relief-for-certain-stationary-sources-to-promote-american-chemical-manufacturing-security/ (July 17, 2025); and The White House, "REGULATORY RELIEF FOR CERTAIN STATIONARY SOURCES TO PROMOTE AMERICAN IRON ORE PROCESSING SECURITY," available at https://www.whitehouse.gov/presidential-actions/2025/07 /regulatory-relief-for-certain-stationary-sources-to-promote-american-iron-ore-processing-security / (July 17, 2025).

additional stationary sources from the requirements in the MATS Rule, President Trump exempted certain stationary sources from the final rule requirements for commercial sterilization facilities, taconite iron ore processors, and the chemical manufacturing sector. The sources that received an exemption are identified in Annex I of the Proclamations and are available on the White House website.[3]

As set out in the Proclamation, the President's exemption lasts for a period of two years beyond the MATS Rule's compliance date -- *i.e.*, for the period beginning July 8, 2027, and concluding July 8, 2029. During the two-year period these stationary sources identified in Annex 1 are subject to the compliance obligations under the MATS as it existed prior to the MATS Rule (89 FR 38508).

Again, thank you for your letter. If you have any further questions, please contact me, or your staff may contact Amir Ingram in EPA's Office of Congressional and Intergovernmental Relations at ingram.amir@epa.gov.

Sincerely,

Aaron Szabo
Assistant Administrator

You don't often get email from daryl@ansci.us. Learn why this is important

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Good Morning, [redacted],

Welcome back, and I hope you had a relaxing Thanksgiving.

We are urgently trying to ascertain whether or not Andersen Scientific, Inc., made the 2-year Presidential extension for NESHAP EO contract sterilizers. I have been trying to contact John Reiten and Marc Marie at the White House, but have had no luck.

One of our clients is the sole provider of a **Department of Defense** drug for US soldiers, and so this is a matter of urgency. We are **not** on the Whitehouse list of contract sterilizers, and I am trying to get clarification if we are or are not, and if not, what can we do considering the risks this will put to a delicate resource used by the US Government.

Is there a contact I can reach to gain some clarification on whether we made this list, and if not, what we need to do for reconsideration?

Thank you in advance.

Regards,

Hi Aaron, Abbie and Alex – Sean re-upped his request for information on EPA's role in the implementation of the CAA Sec. 112(i)(4) presidential exemption program. Sean's deadline is COB Thursday. Looking for guidance here. Thanks!

Inquiry -

In light of the presidential proclamations issued last Thursday, I'm seeking to clarify EPA's role in implementation of the Sec. 112 (i)(4) program, given that EPA created and maintained the email inbox to solicit applications for the program. In that context, I have the following questions:

1. When an application for an exemption was received, how did EPA then handle the application?
2. Did, for example, EPA immediately forward the application to the White House with no further action on EPA's part to process or vet the applications?
3. If so, to whom at the White House did EPA forward the application?
4. If not, what steps did EPA then take to process the application? Did EPA take any steps to evaluate the application against the statutory criteria in the Clean Air Act? Was there a written SOP for how such evaluations were to be carried out and, if so, will EPA provide a copy of that SOP?
5. Who carried out the evaluations-e.g., career staff in the Office of Air and Radiation or someone else?
6. Did political appointees have any role in the evaluation process and, if so, what was it?
7. For each application, did EPA provide a recommendation to the White House as to whether an exemption should be granted?
8. According to this EPA website (**https://www.epa.gov/stationary-sources-air-pollution/clean-air-act-section-112-presidential-exemption-information)**, the deadline for applications was March 31, 2025. Has EPA accepted applications past that deadline and, if so, who were the applicants? Does EPA continue to accept applications?

My deadline is COB Thursday, July 24. On the record responses, please.

Respectfully,

[redacted]

Subject: Flagging: White House compliance delay re commercial sterilization facilities NESHAP - E&E - DDL 11 a.m.

Hi Aaron, Abbie and Alex,

Flagging a follow-up question from Sean reference EPA's role in vetting CAA exemption applications. Any guidance here? The deadline is 11 a.m.

Follow-up -
Thanks for your reply which, I have to respectfully note, still doesn't directly address my question. As you know, EPA created the email inbox to receive applications for this program. Does EPA then have any role in vetting applications for consistency with the program criteria? Or does EPA simply forward the applications with no review to the White House?

Inquiry –

My name is Andrea Nejman and I'm a producer for *Spotlight on America.*

I'm following up on the email portal set up for requests for exemption to the HON rule, including EtO emissions using the address "[redacted]@epa.gov".

Please answer the following questions before our deadline of July 1st:

- Have any exemptions been granted to companies as of now?
  - If so, which companies have been granted the exemptions to the HON rule and on what grounds? Please provide documentation.
- If exemptions are still being considered, please provide a timeline for when those decisions will be made.

Response -

Section 112(i)(4) specifically states that the President may exempt any stationary source "if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." This is an authority that solely rests with the President, not EPA.

Any further questions on this process or the status of exemptions should be directed to the White House.

Respectfully,

Hi All,

It's Ariel Wittenberg at E&E News. Hope you're doing well.

I'm working on an article about how EPA's deregulatory agenda conflicts with Trump administration initiatives addressing cancer and pediatric cancer. By my count looking at the regulatory rollbacks EPA announced in March, you've target 12 regulations that limit releases of carcinogens into air and water, some of which limit exposure to multiple cancer-causing chemicals.

For example, the ELG rule that EPA is proposing to delay would avoid some 98 bladder cancer cases annually by reducing bromide releases. The NESHAPs rule EPA is now reconsidering was previously calculated to reduce air-toxics-related cancer risk by 96 percent in the communities surrounding facilities subject to that regulation.

Do you have any comment?

Also, I understand that Admin. Zeldin has said many of the agency's rollbacks are necessary for the United States to become a leader in artificial intelligence to power data centers, and that artificial intelligence plays a key role in HHS' plans to address childhood cancer, as with the Executive Order signed by President Trump this

week. Does Admin. Zeldin believe the additional cancer risk from emissions is a necessary trade off? If the Trump administration is concerned with addressing cancer, why not focus on reducing cancer cases?

My deadline is 4 pm ET.

Thanks,

Ariel

ELG bladder cancer cases methodology is explained on this doc from the 2024 final rule announcement beginning on page 79 with the stat on page 86 here: https://www.epa.gov/system/files/documents/2024-04/steamelectricelg_2024final_bca_508compliant.pdf. NESHAP stat comes from this document which was part of an EPA community risk assessment: https://www.epa.gov/system/files/documents/2023-04/HON%20P%26R.%20Demographic%20Analysis.Fact%20Sheet.%204.6.23.pdf

Here's the list of the 12 actions:

1. Air Quality standards for soot -- soot, benzene, formaldehyde, PAH
2. Boiler rule--soot, arsenic, cadmium, chromium, cobalt, lead, nickel
3. Carbon pollution standards for FF plants---soot, benzene, formaldehyde, PAH
4. Clean car rule--Soot, benzene
5. Clean trucks---soot, benzene, formaldehyde, PAH
6. Good neighbor rule-- Soot, benzene, formaldehyde, PAH, arsenic, cadmium, chromium, nickel

7. MATS-- arsenic, cadmium cobalt, lead, beryllium
8. Oil/gas methane rule--Benzene
9. Coal wastewater rule--arsenic nickel cadmium lead cobalt
10. NESHAP--Ethelyne oxide
11. Drinking water PFAS---PFAS
12. Risk management program for chem, oil and gas plants--Arsenic, benzene , Ethelyne oxide, formaldehyde

Also, I understand that Admin. Zeldin has said many of the agency's rollbacks are necessary for the United States to become a leader in artificial intelligence to power data centers, and that artificial intelligence plays a key role in HHS' plans to address childhood cancer, as with the Executive Order signed by President Trump this week. Does Admin. Zeldin believe the additional cancer risk from emissions is a necessary trade off? If the Trump administration is concerned with addressing cancer, why not focus on reducing cancer cases?

My deadline is 4 pm ET.

Thanks,

Ariel

Attachments: complaint.pdf

Flag: Follow up

OGC/Dan approved –

Inquiry –
Hi, I'm doing a story today on the attached complaint filed by environmental groups who allege President Trump and the EPA have illegally delayed compliance deadlines with various air pollution rules. Does the EPA have any comment in response to the complaint? I can add a comment to the story until 5 p.m. EDT today.

Response –
In keeping with a longstanding practice, EPA does not comment on any current or pending litigation.

Hi Brigit and EPA press team,

I hope you're all doing well. I'm working on an article about Freeport-McMoRan's copper smelter in Miami, Arizona, which President Trump exempted from compliance with EPA's copper rule last month.

The article will mention that Abigale Tardif, the principal deputy assistant administrator in EPA's Office of Air and Radiation, emailed with a lobbyist for Freeport-McMoRan about how the company could best position itself to obtain the presidential exemption under the Clean Air Act, according to emails obtained by the Environmental Defense Fund via the Freedom of Information Act.

I have attached those emails for your reference, and I was hoping you could answer the following questions. My deadline is currently set for **5pm ET tomorrow**, although it might be extended.

- Can you confirm whether Abigale Tardif had a call with the lobbyist for Freeport-McMoRan, Patrick Traylor, in March?
- How would EPA respond to criticism from environmentalists that these emails show a remarkable degree of coordination between the agency and one of the companies it regulates?

Please let me know and thank you for considering this request. I will also reach out to the White House regarding the presidential exemption.

Best,

Maxine

Thanks so much for the quick response. As a general rule, the New York Times cannot quote anonymous spokespeople. Could I please attribute this response to Carolyn Holran or another EPA spokesperson by name? Thanks.

On Thu, Nov 20, 2025 at 3:04 PM EPA Press Office <Press@epa.gov> wrote:

Adding Carolyn Holran, who can be on all future press inquiries along with Brigit Hirsch.

Abbie Tardif never had a call with the lobbyist for Freeport-McMoRan, Patrick Traylor. You are deliberately jumping to conclusions to fit your prewritten narrative; a publicly available link was sent. Period. End of

story. EPA regularly engages with a wide range of stakeholders, including entities that we may regulate, and these engagements are an essential component of our work to protect human health and the environment.

EPA Clean Air Act section 112(i)(4) authorizes the President to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." EPA played no role in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

This story seems like a waste of your time and begs the question: where was The New York Times when legitimate concerns were raised regarding the Biden-Harris Administration's ACTUAL coordination when they awarded 20 billion in taxpayer dollars to their friends?

Team – Please see the below from a company following up on their exemption request. The company has reached out to the WH (not sure if the folks listed in the email are the correct points of contact). Please advise.

Incoming -
We are urgently trying to ascertain whether or not Andersen Scientific, Inc., made the 2-year Presidential extension for NESHAP EO contract sterilizers. I have been trying to contact John Reiten and Marc Marie at the White House, but have had no luck.

One of our clients is the sole provider of a **Department of Defense** drug for US soldiers, and so this is a matter of urgency. We are **not** on the Whitehouse list of contract sterilizers, and I am trying to get clarification if we are or are not, and if not, what can we do considering the risks this will put to a delicate resource used by the US Government.

Is there a contact I can reach to gain some clarification on whether we made this list, and if not, what we need to do for reconsideration?

Respectfully,

You can send the below:

"NRDC is peddling misleading, cherry-picked data in a desperate attempt to drum up donations. They've been lurking behind the scenes of previous unconstitutional EPA power grab and gleefully bragged about destroying American jobs and businesses. Bottomline: they are bad faith actors who shouldn't be trusted. In fact, applying even the slightest bit of scrutiny to their "analysis" completely shatters it. For starters, MATS has little

or nothing to do with sulfur dioxide emissions. And even if the now-repealed Biden EPA 2024 MATS rule had gone into effect, compliance with the 2024 MATS requirements was not required until 2027, so those requirements did not impact 2025 emissions. Second, plants that received a presidential exemption are still required to operate under 2012 MATS standards, which NRDC SUPPORTED! Heck, the Biden EPA reaffirmed that the 2012 standards protected public health and successfully lowered emissions. As a result of the highly effective 2012 MATS standards, mercury emissions from coal-fired power plants fell 90 percent by 2021. Since the 2012 MATS rule was put into place, acid gas hazardous air pollutant emissions decreased by over 96 percent and emissions of the non-mercury metals—including nickel, arsenic, and lead—declined by more than 81 percent. Funny how NRDC neglects to mention any of this, and it's also funny how they've never once criticized China for the gargantuan levels of pollution they emit, much of which drifts over to the United States and harms our air quality. Makes you wonder what's going on in their Beijing office, doesn't it?

"Moreover, U.S. air quality has seen massive improvements in recent decades. Right now, Americans enjoy crisp clean air that would be the envy of past generations. Incorrectly cherry-picking one year of data, while ignoring the overall downward trend in emission levels is just misleading and meant to distract from the hundreds of environmental wins the Trump EPA has racked up over the past year-plus. The Trump EPA is better positioned than ever before to protect human health and the environment while also Powering the Great American Comeback." -EPA spox

On background
Clean Air Act section 112(i)(4) authorizes the President to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." EPA played no role in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

Can also send it here:

"NRDC is peddling misleading, cherry-picked data in a desperate attempt to drum up donations. They've been lurking behind the scenes of previous unconstitutional EPA power grab and gleefully bragged about destroying American jobs and businesses. Bottomline: they are bad faith actors who shouldn't be trusted. In fact, applying even the slightest bit of scrutiny to their "analysis" completely shatters it. For starters, MATS has little or nothing to do with sulfur dioxide emissions. And even if the now-repealed Biden EPA 2024 MATS rule had gone into effect, compliance with the 2024 MATS requirements was not required until 2027, so those requirements did not impact 2025 emissions. Second, plants that received a presidential exemption are still required to operate under 2012 MATS standards, which NRDC SUPPORTED! Heck, the Biden EPA reaffirmed that the 2012 standards protected public health and successfully lowered emissions. As a result of the highly effective 2012 MATS standards, mercury emissions from coal-fired power plants fell 90 percent by 2021. Since the 2012 MATS rule was put into place, acid gas hazardous air pollutant emissions decreased by over 96 percent and emissions of the non-mercury metals—including nickel, arsenic, and lead—declined by more than 81 percent. Funny how NRDC neglects to mention any of this, and it's also funny how they've never once criticized China for the gargantuan levels of pollution they emit, much of which drifts over to the United States and harms our air quality. Makes you wonder what's going on in their Beijing office, doesn't it?

"Moreover, U.S. air quality has seen massive improvements in recent decades. Right now, Americans enjoy crisp clean air that would be the envy of past generations. Incorrectly cherry-picking one year of data, while ignoring the overall downward trend in emission levels is just misleading and meant to distract from the

hundreds of environmental wins the Trump EPA has racked up over the past year-plus. The Trump EPA is better positioned than ever before to protect human health and the environment while also Powering the Great American Comeback." -EPA spox

On background
Clean Air Act section 112(i)(4) authorizes the President to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." EPA played no role in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

Team – Flagging the below from The Hill. Also including the statement sent to WSJ. I've asked for the deadline.

Inquiry -
I hope all is well and I apologize for sending two emails back-to-back.

Do you all want to comment on this analysis of power plant pollution?

Response sent to WSJ –

"Once again, the media is grasping at straws to make a lot out of nothing. Frankly speaking, you are jumping to conclusions that don't make a lot of sense. Let's get the facts straight. First, the repealed 2024 MATS amendments had little or nothing to do with sulfur dioxide emissions. Second, even if the Biden EPA's 2024 rule had gone into effect, compliance with the 2024 MATS requirements was not required until 2027, so those requirements did not impact 2025 emissions. To go even further, the U.S. has seen huge emission reductions as a result of the highly effective 2012 MATS standards. In 2021, under the original standards, mercury emissions from coal-fired power plants were already 90 percent lower than pre-MATS levels. And since the 2012 MATS rule was put into place, acid gas hazardous air pollutant emissions have been reduced by over 96 percent, and emissions of the non-mercury metals—including nickel, arsenic, and lead—have been reduced by more than 81 percent. Bottom line, the 2012 MATS requirements protect public health, and the 2024 MATS requirements were costly and unnecessary. And to drive this home, in 2024 the Biden EPA reaffirmed that the 2012 standards were protective of public health and successful in lowering emissions.

"Incorrectly cherry-picking one year of data, while ignoring the overall downward trend in emission levels is just misleading and meant to distract from the hundreds of environmental wins the Trump EPA has racked up over the past year-plus. The Trump EPA is better positioned than ever before to protect human health and the environment while also Powering the Great American Comeback." -EPA spox

Hey Brigit –

Here are the reporter's questions –

My main questions could probably be summarized like this:

-How does the EPA respond to the environmental and public health toll posed by granting the exemptions?
-What were the agency's reasons for granting the exemptions?
-And can the agency can provide me with its response to Ameren's March 31 letter to EPA Administrator Lee Zeldin, requesting exemption for the utility?

Hi Team,

Please see an inquiry from the St. Louis Dispatch on MATS exemptions/emissions. I asked the reporter to share relevant links as I did not want to assume he's referring to the NRDC report. He shared a link to the Clean Air Markets Program Data tool. The deadline is noon tomorrow.

Inquiry:

My name is Bryce Gray and I'm a reporter for the St. Louis Post-Dispatch. I'm hoping to ask any relevant expert some questions about recently released EPA data that shows increased emissions of air pollutants at coal-fired power plants that received certain regulatory exemptions from the agency last year.

Beyond hearing the EPA's response to the move's public health toll and its reasons for granting the exemptions, I'm also hoping that the agency can provide me with copies of its response to Ameren's March 31 letter to EPA Administrator Lee Zeldin, requesting exemption.

I can be reached at 314-340-8307. Thanks in advance for your time and help.

Thanks for the quick reply. The emissions data can be found through this query tool on the EPA's website.

As for a deadline, I'll probably need any responses by about noon tomorrow.

Ah, yes, sorry for forgetting the link. Here it is: https://campd.epa.gov/data/custom-data-download.

Minus OMR, ok to send our presidential exemption statement here? Or given that the reporter is very likely going based off of the NRDC press release, can we send part of or the full statement?

Ex. 5 Deliberative Process (DP)

Hey Brigit –

Here are the reporter's questions –

My main questions could probably be summarized like this:

-How does the EPA respond to the environmental and public health toll posed by granting the exemptions?
-What were the agency's reasons for granting the exemptions?
-And can the agency can provide me with its response to Ameren's March 31 letter to EPA Administrator Lee Zeldin, requesting exemption for the utility?

Hi Team,

Please see an inquiry from the St. Louis Dispatch on MATS exemptions/emissions. I asked the reporter to share relevant links as I did not want to assume he's referring to the NRDC report. He shared a link to the Clean Air Markets Program Data tool. The deadline is noon tomorrow.

Inquiry:

My name is Bryce Gray and I'm a reporter for the St. Louis Post-Dispatch. I'm hoping to ask any relevant expert some questions about recently released EPA data that shows increased emissions of air pollutants at coal-fired power plants that received certain regulatory exemptions from the agency last year.

Beyond hearing the EPA's response to the move's public health toll and its reasons for granting the exemptions, I'm also hoping that the agency can provide me with copies of its response to Ameren's March 31 letter to EPA Administrator Lee Zeldin, requesting exemption.

I can be reached at 314-340-8307. Thanks in advance for your time and help.

Thanks for the quick reply. The emissions data can be found through this query tool on the EPA's website.

As for a deadline, I'll probably need any responses by about noon tomorrow.

Ah, yes, sorry for forgetting the link. Here it is: https://campd.epa.gov/data/custom-data-download.

[redacted] we can send:

"We only have to assume you fell for the very misleading and cherry-picked data the NRDC is spreading in a desperate attempt to drum up donations. Bottom line: they are bad faith actors who shouldn't be trusted. In fact, applying even the slightest bit of scrutiny to their "analysis" completely shatters it. For starters, MATS has little or nothing to do with sulfur dioxide emissions. And even if the now-repealed Biden EPA 2024 MATS rule had gone into effect, compliance with the 2024 MATS requirements was not required until 2027, so those requirements did not impact 2025 emissions. Second, plants that received a presidential exemption are still required to operate under 2012 MATS standards. The Biden EPA reaffirmed that the 2012 standards protected public health and successfully lowered emissions. As a result of the highly effective 2012 MATS standards, mercury emissions from coal-fired power plants fell 90 percent by 2021. Since the 2012 MATS rule was put into place, acid gas hazardous air pollutant emissions decreased by over 96 percent and emissions of the non-mercury metals—including nickel, arsenic, and lead—declined by more than 81 percent. Maybe you should check the facts next time before relying on the NRDC, if in fact that is where you are getting this from. Regardless, the facts about EPA's action remain unchanged.

Moreover, U.S. air quality has seen massive improvements in recent decades. Right now, Americans enjoy crisp clean air that would be the envy of past generations. Incorrectly cherry-picking one year of data, while ignoring the overall downward trend in emission levels is just misleading and meant to distract from the hundreds of environmental wins the Trump EPA has racked up over the past year-plus. The Trump EPA is better positioned than ever before to protect human health and the environment while also Powering the Great American Comeback." - EPA spox

On background
Clean Air Act section 112(i)(4) authorizes the President to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." EPA played no role in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were

forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

Good afternoon, Team –

Flagging an inquiry from CNN on MATS. The deadline is 2 p.m. Friday. Let me know if you'd like me to take any of this to the program.

Inquiry –
Hi, I'm working on a story for next week about the Trump administration's recent rollback of the Biden-era MATs rules and communities impacted by that rollback. The story is focused in part on the Colstrip power plant in Montana, and I had the following questions.

- Last year, Colstrip applied and was granted an exemption for pollution controls used by every other coal plant in the US, citing economic harms. Why did EPA exempt the plant from installing technology that's in widespread use by other power plants to control such pollution?
- Colstrip is mentioned in EPA's final rule as having some of the largest costs to comply with pollution controls of any plant in the nation — amounting to nearly half of the Biden-era rule's total compliance costs. How big of a factor was Colstrip's costs in EPA's rollback of the Biden-era rules?

- Critics of the rollback have pointed to concerns that the Biden-era MATs rule required something that 90% of coal plants were already complying with and wouldn't have presented significant added costs to plants. Do you have a response to that critique?
- Do you have any response to concerns from the local community and Montana public health experts about mercury pollution and other particulate pollution from the Colstrip power plant?
- Anything else you'd like to address?

I'm looking for a response by 2pm EST Friday, March 13.

Respectfully,

Hey Brigit – Please see the below from OCAP. Would you like the OAR IO to review?

See answer to Brigit's question below:

Per the Annex that the WH shared with EPA, which is now posted on our website (https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf), Talen Montana, LLC and NorthWestern Energy a. Affected Facility/Source: Colstrip Steam Electric Station Units 3 and 4 is covered by the President's exemption.

Not sure this needs to be routed through the OAR IO since OCAP was able to definitively answer Brigit's question, but let me know.

Thanks!
Jill

Subject: Re: Flag: CNN - MATs story, checking for comment - DDL 2 p.m. Friday, March 13

[redacted], the below is good to go:

"The 2024 MATS regulation was another notch in the Biden-Harris Administration's war on coal. The rule imposed massive costs and red tape on coal-and oil-fired power plants, driving up the cost of living for American families, jeopardizing our grid reliability and national security, and limiting American energy and manufacturing dominance. The Trump EPA's repeal of the Biden 2024 MATS amendments ensures the continuation of the highly effective and robust 2012 MATS requirements, which have protected of public health and the environment for years. By doing so, EPA is fulfilling its core mission without compromising America's energy or economic prosperity. Since the 2012 MATS rule was put into place, acid gas hazardous air pollutant emissions have been reduced by over 96 percent, and emissions of the non-mercury metals — including nickel, arsenic, and lead — have been reduced by more than 81 percent. Even the Biden-Harris Administration reaffirmed the success of these standards when stating the original 2012 standards provided an ample margin of safety to protect public health in their regulatory impact analysis. Ensuring affordable baseload power, including coal, is essential for keeping the lights on and heating American homes. We saw this recently during Winter Storm Fern. EPA is committed to ensuring clean air for all Americans regardless of race, gender, creed, or background." — EPA spox

On Background
At minimum a reporter should get the basic facts correct— Clean Air Act section 112(i)(4) authorizes the ***President*** to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." ***EPA played no role*** in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

Hey Brigit – Please see the below from OCAP. Would you like the OAR IO to review?

See answer to Brigit's question below:

Per the Annex that the WH shared with EPA, which is now posted on our website (https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf), Talen Montana, LLC and NorthWestern Energy a. Affected Facility/Source: Colstrip Steam Electric Station Units 3 and 4 is covered by the President's exemption.

Not sure this needs to be routed through the OAR IO since OCAP was able to definitively answer Brigit's question, but let me know.

Thanks!
Jill

Good afternoon, Team –

Flagging an inquiry from CNN on MATS. The deadline is 2 p.m. Friday. Let me know if you'd like me to take any of this to the program.

Inquiry –
Hi, I'm working on a story for next week about the Trump administration's recent rollback of the Biden-era MATs rules and communities impacted by that rollback. The story is focused in part on the Colstrip power plant in Montana, and I had the following questions.

- Last year, Colstrip applied and was granted an exemption for pollution controls used by every other coal plant in the US, citing economic harms. Why did EPA exempt the plant from installing technology that's in widespread use by other power plants to control such pollution?
- Colstrip is mentioned in EPA's final rule as having some of the largest costs to comply with pollution controls of any plant in the nation — amounting to nearly half of the Biden-era rule's total compliance costs. How big of a factor was Colstrip's costs in EPA's rollback of the Biden-era rules?

- Critics of the rollback have pointed to concerns that the Biden-era MATs rule required something that 90% of coal plants were already complying with and wouldn't have presented significant added costs to plants. Do you have a response to that critique?
- Do you have any response to concerns from the local community and Montana public health experts about mercury pollution and other particulate pollution from the Colstrip power plant?
- Anything else you'd like to address?

I'm looking for a response by 2pm EST Friday, March 13.

Respectfully,

Inquiry –

My name is Andrea Nejman and I'm a producer for *Spotlight on America.*

I'm following up on the email portal set up for requests for exemption to the HON rule, including EtO emissions – using the address "[redacted]".

Please answer the following questions before our deadline of July 1st:

- Have any exemptions been granted to companies as of now?
    - If so, which companies have been granted the exemptions to the HON rule and on what grounds? Please provide documentation.
- If exemptions are still being considered, please provide a timeline for when those decisions will be made.

Response -
Section 112(i)(4) specifically states that the President may exempt any stationary source "if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." This is an authority that solely rests with the President, not EPA.

Any further questions on this process or the status of exemptions should be directed to the White House.

Yet another follow-up, although no deadline:

Thank you for these responses. Do you have any response to this reporting, that the EPA allowed companies to email to request exemptions from requirements to reduce emissions of toxic chemicals?

https://apnews.com/article/trump-epa-clean-air-exemption-mercury-13f069f79fdc8414d3e428a18d2a01bba
As part of a push to roll back dozens of environmental regulations, the Trump administration is offering coal-fired power plants and other industrial polluters a chance for exemptions from requirements to reduce emissions of toxic chemicals such as mercury, arsenic and benzene.
The Environmental Protection Agency has set up an electronic mailbox to allow regulated companies to request a presidential exemption under the Clean Air Act to a host of Biden-era rules.

https://www.nytimes.com/2025/03/27/climate/epa-air-pollution-exemption-mercury-coal-ash.html
The latest policy allows for companies to apply for exemptions of up to two years, the maximum allowed under the Clean Air Act, from numerous new restrictions on emissions of toxic chemicals like mercury and arsenic. Another is ethylene oxide, a colorless gas that is widely used to sterilize medical devices and is also a carcinogen.

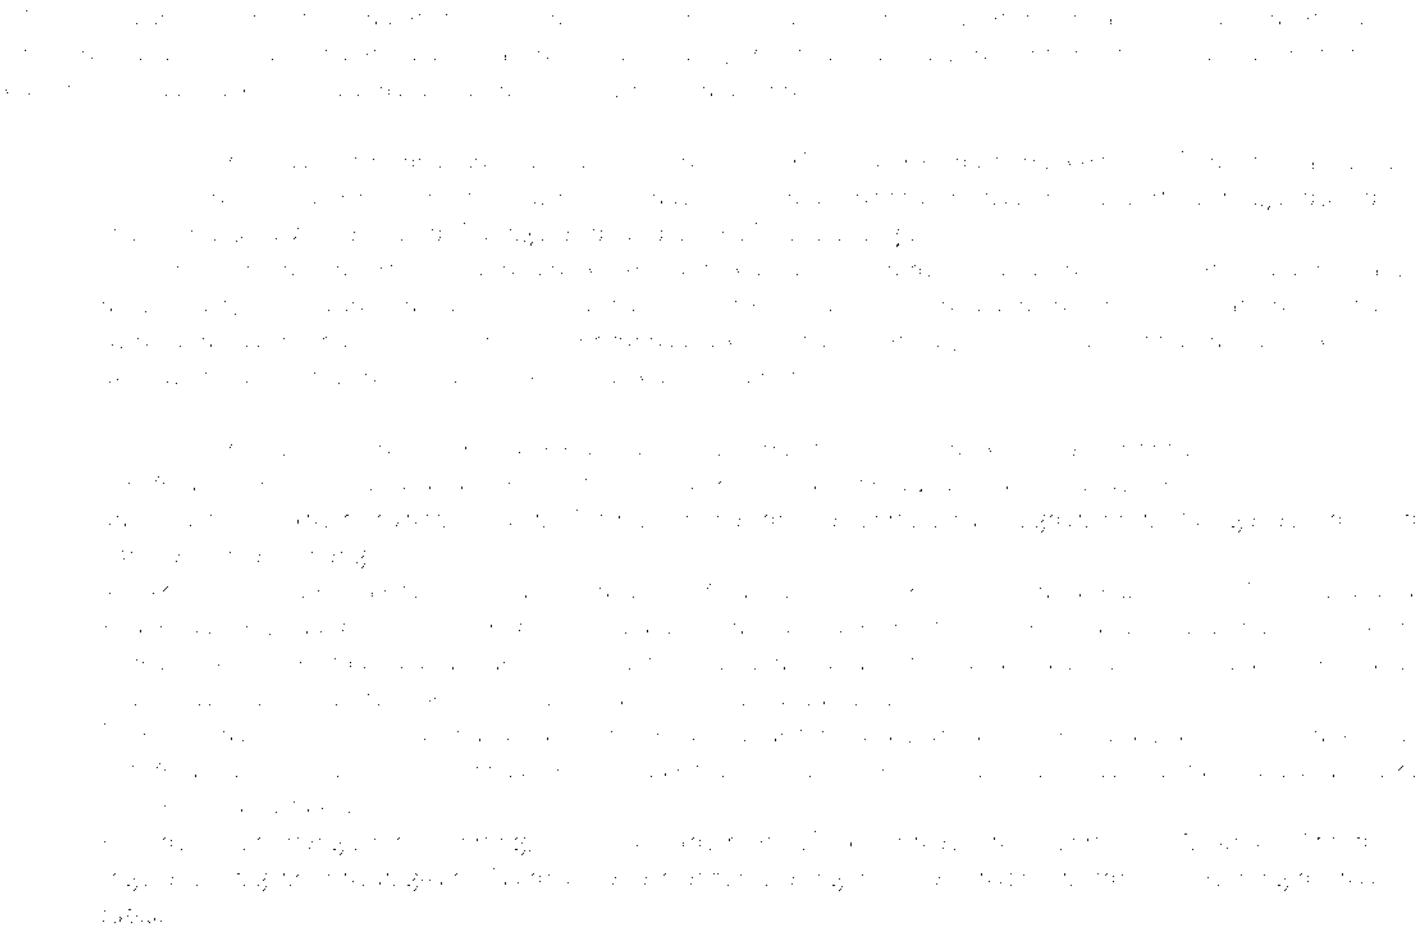
Thank you for your responses. Our script is still in progress so I wanted to alert you to some reporting we are likely to reference in the script.

[redacted]

It is correct that EPA is proposing to repeal all "greenhouse gas" emissions standards for the power sector under Section 111 of the Clean Air Act (CAA). In *West Virginia v. EPA*, the U.S. Supreme Court held that the major questions doctrine barred EPA from misusing the Clean Air Act to manipulate Americans' energy choices and shift the balance of the nation's electrical fuel mix. The Biden Administration issued its own rule in 2024, which many critics say is just another attempt to achieve the unlawful fuel-shifting goals of the Clean Power Plan. Unlike other air pollutants with a regional or local impact, the targeted emissions are global in nature. As a result, any potential public health harms have not been accurately attributed to emissions from the U.S. power sector. In light of this, EPA is proposing that the CAA requires the agency to make a finding that the targeted emissions from fossil fuel-fired power plants significantly contribute to dangerous air pollution before regulating these emissions from this source category. In addition, EPA is proposing that greenhouse gas emissions from fossil fuel-fired power plants do not contribute significantly to dangerous air pollution within the meaning of the statute.

As EPA Administrator Lee Zeldin has said, "Affordable, reliable electricity is key to the American dream and a natural byproduct of national energy dominance. According to many, the primary purpose of these Biden-Harris administration regulations was to destroy industries that didn't align with their narrow-minded climate change zealotry. Together, these rules have been criticized as being designed to regulate coal, oil and gas out of existence."

[redacted]



This article is incorrect: EPA's proposal would leave the Obama-era 2012 MATS requirements in place and propose to remove only the 2024 MATS Amendments, **which are not in effect** (effective date is July 8, 2027).

Again, the effective 2012 MATS requirements remain in effect. The 2012 MATS has driven sharp reductions in harmful air toxic pollutants from coal- and oil-fired power plants. Data shows:

- 2021 mercury emissions from coal-fired EGUs were 90 percent lower than pre-MATS levels;
- Since 2010, acid gas HAP emissions have been reduced by over 96 percent; and
- Emissions of the non-mercury metals – including nickel, arsenic, and lead – have been reduced by more than 81 percent.

The Biden-Harris EPA stated in its 2024 residual risk and technology review that the 2012 MATS rule for coal plants provided an ample margin of safety to protect public health, which we retained in this proposal. The Biden-Harris EPA's regulatory impact analysis also shows the 2024 MATS rule would result in net costs, not net benefits.

EPA is currently soliciting comment on other achievable and cost-effective mercury standards for lignite-fired EGUs that are based on developments in practices, processes, and control technologies for consideration as an alternative to repealing the 1.2 lb/TBtu Hg standard for lignite-fired EGUs. The public comment period closes on August 11, 2025.

It is correct that EPA has proposed to rescind the 2009 Endangerment Finding. If finalized, this proposal would undo the underpinning of $1 trillion in costly regulations, saving Americans more than $54 billion annually. Our comment:

"EPA's proposal is legal in nature. The Endangerment Finding is the legal prerequisite used by the Obama and Biden Administrations to regulate emissions from new motor vehicles and new motor vehicle engines. Absent this finding, EPA

would lack statutory authority under Section 202(a) of the Clean Air Act (CAA) to prescribe standards for greenhouse gas emissions. EPA is bound by the laws established by Congress, including under the Clean Air Act. Congress never explicitly gave EPA authority to impose greenhouse gas regulations for cars and trucks. In fact, Congress recently pulled back on the few, specific actions it previously authorized for greenhouse gases in the One Big Beautiful Bill, and it recently disapproved EPA's decisions to allow California to impose EV mandates in the name of regulating greenhouse gas emissions."

"This action is only a proposal for which EPA is requesting public comment, and no final action has been taken. The Endangerment Finding **only relates to greenhouse emissions from motor vehicles**—which no fake news outlet has accurately reported—and does not relate to any traditional air pollution and those standards would still remain in effect if this regulation is finalized."

To: Wynn Van Dusen <wynn.vandusen@lastweektonight.com>, [redacted]@epa.gov>
Subject: Re: Request for comment from HBO TV Show // Thursday deadline

Wynn,

Please see responses (in blue) for your use:

Wynn, fact-checking your last email and answering your other questions below. There is a lot of inaccuracy and speculation here, which is a disservice to your audience.

We are still cross-checking with you all at the EPA as well as outside subject matter experts, but it was my understanding that this refers a series of actions from the EPA and the OMB in 2025. There was a March 2025 announcement from Mr. Zeldin and the EPA announcing that they are "Overhauling Biden-Harris Administration's "Social Cost of Carbon" in what the Mr. Zeldin refers to as "... the greatest day of deregulation our nation has seen."( )

The bullet point in that press release you're presumably referring to says, "Overhaul the Biden-Harris 'Social Cost of Carbon'". This refers to reviewing and changing (AKA *overhauling*) a Biden-era metric in line with President Trump's executive orders fulfilling the will of the people as expressed at the ballot box last November. It is in no way synonymous with EPA "**declaring that it will no longer consider the social costs of pollution when crafting policy**", which is explicitly something that EPA has never said.

You do not seem to understand what the "Social Cost of Carbon" is or how it works.

Then, in May, we find EO 14154, which notes it was issued "in consultation with the EPA" and states:

Specifically, EO 14154 states that, among other things, "[t]he calculation of the 'social cost of carbon' is marked by logical deficiencies, a poor basis in empirical science, politicization, the absence of a foundation in legislation." It **also charges the EPA with issuing guidance to address the inadequacies of social cost of carbon analyses and to consider eliminating the social cost of carbon** calculation from any Federal regulatory and permitting decisions. **EO 14154 accordingly disbanded the Interagency Working Group on the Social Cost of Greenhouse Gases (IWG),** which

was established pursuant to EO 13990, and withdrew any guidance, instruction, recommendation, or document issued by the IWG. As such, it is no longer Federal government policy to maintain a uniform estimate of the monetized impacts of greenhouse gas em1ss10ns.

Once again, this refers to *overhauling* a Biden-era metric. It is in no way synonymous with "**declaring that it will no longer consider the social costs of pollution when crafting policy**", which is explicitly something that EPA has never said.

I was also looking at NYT reporting from May of this year, which notes that this move "effectively shelves" the social cost of carbon:

The White House has ordered federal agencies to stop considering the economic damage caused by climate change when writing regulations, except in cases where it is "plainly required" by law.
The directive . . . . . a powerful tool that has been used for more than two decades by the federal government to weigh the costs and benefits of a particular policy or regulation.
...
But "it is no longer federal government policy to maintain a uniform estimate of the monetized impacts of greenhouse gas emissions," Jeffrey B. Clark, the acting administrator of the White House Office of Information and Regulatory Affairs, wrote in a May 5 memo.
...
Scientists and environmental groups say that the Trump administration is denying reality.
"It's very clear that climate change is causing harms to people in the United States and around the world, and that these harms are growing worse with increasing warming," said Robert E. Kopp, a climate scientist at Rutgers University. **"By effectively saying the social cost of carbon should be treated as zero, this policy arbitrarily and capriciously ignores the science and economics of climate change."**

Michael Greenstone, an economist at the University of Chicago who first came up with the idea of the social cost of carbon as a justification for climate policy, said the new guidance means "feelings, not facts" would guide federal policy.

These examples list federal agencies not named EPA. If you were to say that EPA declared it would no longer consider the social costs of pollution when crafting policy, you would be incorrect. You also seem to be conflating greenhouse gas emissions with criteria air pollutants that EPA is legally obligated to regulate: the Clean Air Act requires EPA to set National Ambient Air Quality Standards (NAAQS) for six commonly found air pollutants known as criteria air pollutants. These are: ozone, particulate matter, carbon monoxide, lead, sulfur dioxide, and nitrogen dioxide.

But we send out these fact-checking inquiries for a reason. Would you want to make us aware of any data or literature that refutes the idea that Mr. Zeldin and the EPA are overhauling or effectively doing away with the social costs of carbon? Are we misunderstanding what Mr. Zeldin meant by the greatest day of deregulation our nation has ever seen? Or are you suggesting that the above materials are accurate but Politico's phrasing is not? Happy to discuss further.

Good thing because you have no idea what you're talking about. You have a fundamental misunderstanding of the facts based on incorrect speculation from your sources, which are not accurate or precise in their understanding of EPA's statutory obligations.

ANSWERS TO ORIGINAL QUESTIONS

1. **"Under Trump, Lee Zeldin's EPA has declared that it will no longer consider the social costs of pollution when crafting policy. It has eliminated restrictions on mercury emissions, soot and haze, all of which are pollutants with well-documented links to neurological damage and respiratory illness. As a result, mercury will now continue contaminating our water, air and food, and air pollutants will worsen asthma, weaken immune systems and increase rates of cancers, heart disease and stroke. The EPA has, in fact, moved to revoke the legal basis for regulating greenhouse gases altogether. These**

are precisely the kinds of environmental toxins that pose systemic threats to human health." (https://www.politico.com/news/magazine/2025/04/02/rfk-jr-s-maha-movement-has-a-fatal-flaw-00263926)

This is not accurate. On mercury, the 2024 MATS Amendments are not in effect (effective date is July 8, 2027). The effective 2012 MATS requirements remain in effect. The 2012 MATS has driven sharp reductions in harmful air toxic pollutants from coal- and oil-fired power plants. Data shows:

- 2021 mercury emissions from coal-fired EGUs were 90 percent lower than pre-MATS levels;
- Since 2010, acid gas HAP emissions have been reduced by over 96 percent; and
- Emissions of the non-mercury metals – including nickel, arsenic, and lead – have been reduced by more than 81 percent.

The Biden-Harris EPA stated in its 2024 residual risk and technology review that the 2012 MATS rule for coal plants provided an ample margin of safety to protect public health, which was retained in the current proposal. The Biden-Harris EPA's regulatory impact analysis also shows the 2024 MATS rule would result in net costs, not net benefits.

The public comment period on the proposal closes on August 11, 2025.

"No longer will the EPA view the goals of protecting our environment and growing our economy as binary choices. We will and we must choose both. Administrator Lee Zeldin announced his Powering the Great American Comeback initiative to better achieve the agency's statutory mission and as such the first pillar of this initiative is clean air, land, and water for EVERY American. In his first term, President Trump advanced conservation and environmental stewardship while promoting economic growth for families across the country and will continue to do so this term." – EPA spox

The Trump EPA has done incredible work to keep America clean, carrying out its core mission of protecting human health and the environment:

- The Administrator's priorities for EPA can be found here: EPA Administrator Lee Zeldin Announces EPA's "Powering the Great American Comeback" Initiative | US EPA
- On the 100th day of the Trump EPA, Administrator Zeldin announced 100 of Trump's environmental wins: 100 Days, 100 Environmental Accomplishments | US EPA
- On the 200th day of the Trump EPA, Administrator Zeldin announced 100 *more* of Trump's environmental wins: EPA Celebrates Another 100 Days with 100 More Pro-Environmental Actions | USA EPA
- Just last month, thanks to President Trump's leadership, Administrator Zeldin announced a 100% solution to the decades-old Tijuana River Sewage Crisis: United States and Mexico Reach Agreement to Permanently and Urgently End Decades-Long Tijuana River Sewage Crisis
- West Lake Landfill: After visiting St. Louis with Senator Hawley, Administrator Zeldin announced an expedited cleanup timeline for the stie. The update cuts nearly two years off of the initial draft timeline presented by PRP consultants for the West Lake site, outlining resource needs and actionable items to expedite the cleanup from a May 2029 excavation start date to a 2027 excavation start date.

In addition to all of this action in just 200 days, the Trump EPA proposed to rescind the 2009 Endangerment Finding. The Clean Air Act requires EPA to set National Ambient Air Quality Standards (NAAQS) for six commonly found air pollutants known as criteria air pollutants. These are: ozone, particulate matter, carbon monoxide, lead, sulfur dioxide, and nitrogen dioxide – this does not include greenhouse gases.

The EPA will not operate as an unconstitutional lawmaker, as it did under previous administrations. The EPA will follow the law.

As EPA Administrator Lee Zeldin said in an interview, "If Congress wants the EPA to be regulating the heck out of carbon dioxide, then they can put it into law. But even the Endangerment Finding itself in 2009 never individually studied carbon dioxide as an endangerment to public health and welfare. They had to do all these other mental leaps because they didn't have the science and the data to be able to make a direct connection."

2. **The EPA has also been slow to move on microplastics and PFAS, both substances of growing concern among scientists and the general public. These invisible but omnipresent chemicals are a priority for the MAHA movement, singled out in the White House report for further study and policymaking. The EPA, though, has delayed implementing a new standard to limit PFAS in drinking water and announced it would consider whether to raise the limits of acceptable PFAS levels in community water systems, while also slashing funding for more research on the substance's health effects. (https://www.vox.com/health/421349/trump-rfk-jr-maha-movement-epa-health)**

This is **categorically untrue**. It would be fearmongering and a disservice to your viewers to imply this at all. See the list of what EPA has accomplished in just 200 days on PFAS below:

"Building on the historic actions to address PFAS during the first Trump Administration, EPA is tackling PFAS from all of our program offices, advancing research and testing, stopping PFAS from getting into drinking water systems, holding polluters accountable, and more. This is just a fraction of the work the agency is doing on PFAS during President Trump's second term to ensure Americans have the cleanest air, land, and water." – EPA spox

Trump Administration Action
In April, U.S. Environmental Protection Agency (EPA) Administrator Lee Zeldin outlined upcoming agency action to address Per- and Polyfluoroalkyl Substances (PFAS). In this suite of actions, Administrator Zeldin announced a long list that included in part the designation of an agency lead for PFAS, the creation of effluent limitations guidelines (ELGs) for certain PFAS to stop these forever chemicals from entering drinking water systems, and initiatives to engage with Congress and industry to establish a clear liability framework that ensures the polluter pays and passive receivers are protected. This list is the first, not the last, of all decisions and actions EPA will be taking to address PFAS over the course of the Trump Administration.

In a May announcement, the Trump EPA launched the PFAS OUT initiative will enhance engagement on addressing PFAS by proactively connecting with every public water utility known to need capital improvements to address PFAS in their systems. EPA will share resources, tools, funding and technical assistance opportunities to help utilities meet the federal drinking water standards. PFAS OUT will ensure that no community is left behind as we work to protect public health and bring utilities into compliance with federal drinking water standards.

EPA continues to offer free water technical assistance (WaterTA) that provides services to water systems to improve their drinking water and help communities access available funding. EPA's WaterTA initiatives work with water systems nationwide to identify affordable solutions to assess and address PFAS, including PFOA and PFOS. EPA supports water systems in reducing PFAS and emerging contaminants (EC) in drinking water through a range of funding resources. In May, EPA announced the availability of $945 million in grants under the EC program that will go to states and territories to help small and disadvantaged communities address PFAS in their water.

EPA is supporting the U.S. Department of Justice in defending ongoing legal challenges to the PFAS National Primary Drinking Water Regulation with respect to PFOA and PFOS.

The agency determined that the process by which it promulgated the preliminary regulatory determinations simultaneously with the proposed regulation was inappropriate and may not comply with the statutory requirements of Safe Drinking Water Act for PFHxS, PFNA, HFPO-DA (commonly known as GenX), and the Hazard Index mixture of these three PFAS plus PFBS. Therefore, the agency intends to rescind the regulations and reconsider these regulatory determinations, ensuring the Agency's actions adhere to the Safe Drinking Water Act process. ***While EPA cannot pre-determine the outcome, it is possible that the result could be more stringent requirements.***

In 2019, the Trump EPA announced the PFAS Action Plan. This historic Plan responded to extensive public interest and input the agency received and represented the first time EPA built a multi-media, multi-program, national communication and research plan to address an emerging environmental challenge like PFAS. EPA's Action Plan identified both short-term solutions for addressing these chemicals and long-term strategies that will help provide the

tools and technologies states, tribes, and local communities need to provide clean and safe drinking water to their residents and to address PFAS at the source—even before it gets into the water.

Here is an easily digestible list of actions the agency already announced to address PFAS:

Strengthening the Science

- Designate an agency lead for PFAS to better align and manage PFAS efforts across agency programs
- Implement a PFAS testing strategy under Toxic Substances Control Act (TSCA) Section 4 to seek scientific information informed by hazard characteristics and exposure pathways
- Launch additional efforts on air related PFAS information collection and measurement techniques related to air emissions
- Identify and address available information gaps where not all PFAS can be measured and controlled
- Provide more frequent updates to the PFAS Destruction and Disposal Guidance—changing from every three years to annually—as EPA continues to assess the effectiveness of available treatment technologies
- Ramp up the development of testing methods to improve detection and strategies to address PFAS

Fulfilling Statutory Obligations and Enhancing Communication

- Develop effluent limitations guidelines (ELGs) for PFAS manufacturers and metal finishers and evaluate other ELGs necessary for reduction of PFAS discharges
- Address the most significant compliance challenges and requests from Congress and drinking water systems related to national primary drinking water regulations for certain PFAS
- Determine how to better use RCRA authorities to address releases from manufacturing operations of both producers and users of PFAS
- Add PFAS to the Toxic Release Inventory (TRI) in line with Congressional direction from the 2020 National Defense Authorization Act
- Enforce Clean Water Act and TSCA limitations on PFAS use and release to prevent further contamination
- Use Safe Drinking Water Act authority to investigate and address immediate endangerment
- Achieve more effective outcomes by prioritizing risk-based review of new and existing PFAS chemicals
- Implement section 8(a)7 to smartly collect necessary information, as Congress envisioned and consistent with TSCA, without overburdening small businesses and article importers.
- Work with Congress and industry to establish a clear liability framework that operates on polluter pays and protects passive receivers

Building Partnerships

- Advance remediation and cleanup efforts where drinking water supplies are impacted by PFAS contamination
- Work with states to assess risks from PFAS contamination and the development of analytical and risk assessment tools
- Finish public comment period for biosolids risk assessment and determine path forward based on comments
- Provide assistance to states and tribes on enforcement efforts
- Review and evaluate any pending state air petitions
- Resource and support investigations into violations to hold polluters accountable

3. **The MAHA report says environmental chemicals may pose risks to children's health. Citing the National Institutes of Health, it said there's a "need for continued studies from the public and private sectors, especially the NIH, to better understand the cumulative load of multiple exposures and how it may impact children's health." Meanwhile, the administration has cut funding for related studies. (https://kffhealthnews.org/news/article/maha-make-america-healthy-again-report-chronic-disease-rfk-trump-funding-cuts/) We were able to confirm that at least three of these grants listed here (https://cfpub.epa.gov/ncer_abstracts/index.cfm/fuseaction/recipients.display/rfa_id/666) were terminated by the EPA and remain so.**

   Is there anything you would like to add or make us aware of, in response to those reported details? Are they accurate? Is there anything we're missing?

We refer you to HHS and NIH for the first part of this question. The MAHA Commission is a presidential commission, so we would also refer you to the White House for comment on that commission specifically.

Of the grants you are referring to in the link, five of them have been terminated: #840198, #840199, #840201, #840202, and #840209. Our comment: "Maybe the Biden-Harris Administration shouldn't have forced their radical agenda of wasteful DEI programs and 'environmental justice' preferencing on the EPA's core mission of protecting human health and the environment." – EPA spox

- **Do you have any additional responses you wish to provide or make us aware of at this time?**

As Administrator Zeldin said to mark the 200th day of the Trump EPA, "The Trump EPA is proving that we can protect the environment and Power the Great American Comeback. 200 days, 200 top environmental actions. This is the pace that motivates us. We will continue to do everything in our power to rack up environmental win after environmental win for the American people."

Thank you,
EPA Press Office

Subject: Re: Request for comment from HBO TV Show // Thursday deadline

> **Caution:** This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

We are still cross-checking with you all at the EPA as well as outside subject matter experts, but it was my understanding that this refers a series of actions from the EPA and the OMB in 2025. There was a March 2025 announcement from Mr. Zeldin and the EPA announcing that they are "Overhauling Biden-Harris Administration's "Social Cost of Carbon" in what the Mr. Zeldin refers to as "... the greatest day of deregulation our nation has seen."(March 12, 2025 EPA press release)

Then, in May, we find EO 14154, which notes it was issued "in consultation with the EPA" and states:

> OMB Memorandum: Specifically, EO 14154 states that, among other things, "[t]he calculation of the 'social cost of carbon' is marked by logical deficiencies, a poor basis in empirical science, politicization, the absence of a foundation in legislation." It **also charges the EPA with issuing guidance to address the inadequacies of social cost of carbon analyses and to consider eliminating the social cost of carbon** calculation from any Federal regulatory and permitting decisions. **EO 14154 accordingly disbanded the Interagency Working Group on the Social Cost of Greenhouse Gases (IWG),** which was established pursuant to EO 13990, and withdrew any guidance, instruction, recommendation, or document issued by the IWG. As such, it is no longer Federal government policy to maintain a uniform estimate of the monetized impacts of greenhouse gas em1ss10ns.

I was also looking at NYT reporting from May of this year, which notes that this move "effectively shelves" the social cost of carbon:

> https://www.nytimes.com/2025/05/10/climate/social-cost-carbon-trump.html
> The White House has ordered federal agencies to stop considering the economic damage caused by climate change when writing regulations, except in cases where it is "plainly required" by law.

The directive effectively shelves **a powerful tool that has been used for more than two decades by the federal government to weigh the costs and benefits of a particular policy or regulation.**

...

But "it is no longer federal government policy to maintain a uniform estimate of the monetized impacts of greenhouse gas emissions," Jeffrey B. Clark, the acting administrator of the White House Office of Information and Regulatory Affairs, wrote in a May 5 memo.

...

Scientists and environmental groups say that the Trump administration is denying reality.

"It's very clear that climate change is causing harms to people in the United States and around the world, and that these harms are growing worse with increasing warming," said Robert E. Kopp, a climate scientist at Rutgers University. **"By effectively saying the social cost of carbon should be treated as zero, this policy arbitrarily and capriciously ignores the science and economics of climate change."**

Michael Greenstone, an economist at the University of Chicago who first came up with the idea of the social cost of carbon as a justification for climate policy, said the new guidance means "feelings, not facts" would guide federal policy.

But we send out these fact-checking inquiries for a reason. Would you want to make us aware of any data or literature that refutes the idea that Mr. Zeldin and the EPA are overhauling or effectively doing away with the social costs of carbon? Are we misunderstanding what Mr. Zeldin meant by the greatest day of deregulation our nation has ever seen? Or are you suggesting that the above materials are accurate but Politico's phrasing is not? Happy to discuss further.

Hi there,

My name is Wynn, and I'm a producer at Last Week Tonight with John Oliver, a show on HBO. I wanted to write because for this week's segment, airing on Sunday (8/17) and taping the day prior, we're planning on airing a piece on the Make America Healthy Again movement. As one part of that, we may briefly mention the EPA and some recent policy changes at the agency that appear to be at odds with the MAHA movement's goals. Ahead of that, I wanted to reach out to give you a heads up and a chance to respond to some specific questions we have about details that may end up in our segment.

My questions are below. **Our deadline for a response,** should you choose to provide one, is **10 am ET on Thursday, August 14th.** Please let me know if there's anyone else I should forward these inquiries to.

Our deadline for a response, should you choose to provide one, is **10 am ET on Thursday, August 14th.** Let me know if you have any questions for me, or if there's anything you'd like to discuss on the phone.

Thanks for your time.

Best,

Wynn

Questions for the EPA

- In our segment, we'll likely focus on some recent developments at the EPA, many of which feel directly at odds with some of Mr. Kennedy's concerns about toxic chemicals and pollutants. We might cite the following reported details:
    1. "Under Trump, Lee Zeldin's EPA has declared that it will no longer consider the social costs of pollution when crafting policy. It has eliminated restrictions on mercury emissions, soot and haze, all of which are pollutants with well-documented links to neurological damage and respiratory illness. As a result, mercury will now continue contaminating our water, air and food, and air pollutants will worsen asthma, weaken immune systems and increase rates of cancers, heart disease and stroke. The EPA has, in fact, moved to revoke the legal basis for regulating greenhouse gases altogether. These are precisely the kinds of environmental toxins that pose systemic threats to human health." (https://www.politico.com/news/magazine/2025/04/02/rfk-jr-s-maha-movement-has-a-fatal-flaw-00263926)
    2. The EPA has also been slow to move on microplastics and PFAS, both substances of growing concern among scientists and the general public. These invisible but omnipresent chemicals are a priority for the MAHA movement, singled out in the White House report for further study and policymaking. The EPA, though, has delayed implementing a new standard to limit PFAS in drinking water and announced it would consider whether to raise the limits of acceptable PFAS levels in community water systems, while also slashing funding for more research on the substance's health effects. (https://www.vox.com/health/421349/trump-rfk-jr-maha-movement-epa-health)
    3. The MAHA report says environmental chemicals may pose risks to children's health. Citing the National Institutes of Health, it said there's a "need for continued studies from the public and private sectors, especially the NIH, to better understand the cumulative load of multiple exposures and how it may impact children's health." Meanwhile, the administration has cut funding for related studies. (https://kffhealthnews.org/news/article/maha-make-america-healthy-again-report-chronic-disease-rfk-trump-funding-cuts/) We were able to confirm that at least three of these grants listed here (https://cfpub.epa.gov/ncer_abstracts/index.cfm/fuseaction/recipients.display/rfa_id/666) were terminated by the EPA and remain so.
    Is there anything you would like to add or make us aware of, in response to those reported details? Are they accurate? Is there anything we're missing?

- **Do you have any additional responses you wish to provide or make us aware of at this time?**

Thanks for your time. Let me know if you have any questions for me.

Best,
Wynn

Yet another follow-up, although no deadline:

Thank you for these responses. Do you have any response to this reporting, that the EPA allowed companies to email to request exemptions from requirements to reduce emissions of toxic chemicals?

https://apnews.com/article/trump-epa-clean-air-exemption-mercury-13f009f79fdc84443a4286818d2a01bba
As part of a push to roll back dozens of environmental regulations, the Trump administration is offering coal-fired power plants and other industrial polluters a chance for exemptions from requirements to reduce emissions of toxic chemicals such as mercury, arsenic and benzene.
The Environmental Protection Agency has set up an electronic mailbox to allow regulated companies to request a presidential exemption under the Clean Air Act to a host of Biden-era rules.

https://www.nytimes.com/2025/03/27/climate/epa-air-pollution-exemption-mercury-coal-ash.html
The latest policy allows for companies to apply for exemptions of up to two years, the maximum allowed under the Clean Air Act, from numerous new restrictions on emissions of toxic chemicals like mercury and arsenic. Another is ethylene oxide, a colorless gas that is widely used to sterilize medical devices and is also a carcinogen.

> **Caution:** This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Thank you for your responses. Our script is still in progress so I wanted to alert you to some reporting we are likely to reference in the script.

It is correct that EPA is proposing to repeal all "greenhouse gas" emissions standards for the power sector under Section 111 of the Clean Air Act (CAA). In *West Virginia v. EPA,* the U.S. Supreme Court held that the major questions doctrine barred EPA from misusing the Clean Air Act to manipulate Americans' energy choices and shift the balance of the nation's electrical fuel mix. The Biden Administration issued its own rule in 2024, which many critics say is just another attempt to achieve the unlawful fuel-shifting goals of the Clean Power Plan. Unlike other air pollutants with a regional or local impact, the targeted emissions are global in nature. As a result, any potential public health harms have not been accurately attributed to emissions from the U.S. power sector. In light of this, EPA is proposing that the CAA requires the agency to make a finding that the targeted emissions from fossil fuel-fired power plants significantly contribute to dangerous air pollution before regulating these emissions from this source category. In addition, EPA is proposing that

greenhouse gas emissions from fossil fuel-fired power plants do not contribute significantly to dangerous air pollution within the meaning of the statute.

As EPA Administrator Lee Zeldin has said, "Affordable, reliable electricity is key to the American dream and a natural byproduct of national energy dominance. According to many, the primary purpose of these Biden-Harris administration regulations was to destroy industries that didn't align with their narrow-minded climate change zealotry. Together, these rules have been criticized as being designed to regulate coal, oil and gas out of existence."

This article is incorrect: EPA's proposal would leave the Obama-era 2012 MATS requirements in place and propose to remove only the 2024 MATS Amendments, **which are not in effect** (effective date is July 8, 2027).

Again, the effective 2012 MATS requirements remain in effect. The 2012 MATS has driven sharp reductions in harmful air toxic pollutants from coal- and oil-fired power plants. Data shows:

- 2021 mercury emissions from coal-fired EGUs were 90 percent lower than pre-MATS levels;
- Since 2010, acid gas HAP emissions have been reduced by over 96 percent; and
- Emissions of the non-mercury metals – including nickel, arsenic, and lead – have been reduced by more than 81 percent.

The Biden-Harris EPA stated in its 2024 residual risk and technology review that the 2012 MATS rule for coal plants provided an ample margin of safety to protect public health, which we retained in this proposal. The Biden-Harris EPA's regulatory impact analysis also shows the 2024 MATS rule would result in net costs, not net benefits.

EPA is currently soliciting comment on other achievable and cost-effective mercury standards for lignite-fired EGUs that are based on developments in practices, processes, and control technologies for consideration as an alternative to repealing the 1.2 lb/TBtu Hg standard for lignite-fired EGUs. The public comment period closes on August 11, 2025.

It is correct that EPA has proposed to rescind the 2009 Endangerment Finding. If finalized, this proposal would undo the underpinning of $1 trillion in costly regulations, saving Americans more than $54 billion annually. Our comment:

"EPA's proposal is legal in nature. The Endangerment Finding is the legal prerequisite used by the Obama and Biden Administrations to regulate emissions from new motor vehicles and new motor vehicle engines. Absent this finding, EPA would lack statutory authority under Section 202(a) of the Clean Air Act (CAA) to prescribe standards for greenhouse gas emissions. EPA is bound by the laws established by Congress, including under the Clean Air Act. Congress never explicitly gave EPA authority to impose greenhouse gas regulations for cars and trucks. In fact, Congress recently pulled back on the few, specific actions it previously authorized for greenhouse gases in the One Big Beautiful Bill, and it recently disapproved EPA's decisions to allow California to impose EV mandates in the name of regulating greenhouse gas emissions."

"This action is only a proposal for which EPA is requesting public comment, and no final action has been taken. The Endangerment Finding **only relates to greenhouse emissions from motor vehicles**—which no fake news outlet has accurately reported—and does not relate to any traditional air pollution and those standards would still remain in effect if this regulation is finalized."

Subject: Re: Request for comment from HBO TV Show // Thursday deadline

Wynn,

Please see responses (in blue) for your use:

Wynn, fact-checking your last email and answering your other questions below. There is a lot of inaccuracy and speculation here, which is a disservice to your audience.

We are still cross-checking with you all at the EPA as well as outside subject matter experts, but it was my understanding that this refers a series of actions from the EPA and the OMB in 2025. There was a March 2025 announcement from Mr. Zeldin and the EPA announcing that they are "Overhauling Biden-Harris Administration's "Social Cost of Carbon" in what the Mr. Zeldin refers to as "... the greatest day of deregulation our nation has seen."( )

The bullet point in that press release you're presumably referring to says, "Overhaul the Biden-Harris 'Social Cost of Carbon'". This refers to reviewing and changing (AKA *overhauling*) a Biden-era metric in line with President Trump's executive orders fulfilling the will of the people as expressed at the ballot box last November. It is in no way synonymous

with EPA "**declaring that it will no longer consider the social costs of pollution when crafting policy**", which is explicitly something that EPA has never said.

You do not seem to understand what the "Social Cost of Carbon" is or how it works.

Then, in May, we find EO 14154, which notes it was issued "in consultation with the EPA" and states:

Specifically, EO 14154 states that, among other things, "[t]he calculation of the 'social cost of carbon' is marked by logical deficiencies, a poor basis in empirical science, politicization, the absence of a foundation in legislation." It **also charges the EPA with issuing guidance to address the inadequacies of social cost of carbon analyses and to consider eliminating the social cost of carbon** calculation from any Federal regulatory and permitting decisions. **EO 14154 accordingly disbanded the Interagency Working Group on the Social Cost of Greenhouse Gases (IWG),** which was established pursuant to EO 13990, and withdrew any guidance, instruction, recommendation, or document issued by the IWG. As such, it is no longer Federal government policy to maintain a uniform estimate of the monetized impacts of greenhouse gas em1ss10ns.

Once again, this refers to *overhauling* a Biden-era metric. It is in no way synonymous with "**declaring that it will no longer consider the social costs of pollution when crafting policy**", which is explicitly something that EPA has never said.

I was also looking at NYT reporting from May of this year, which notes that this move "effectively shelves" the social cost of carbon:

The White House has ordered federal agencies to stop considering the economic damage caused by climate change when writing regulations, except in cases where it is "plainly required" by law.
The directive a powerful tool that has been used for more than two decades by the federal government to weigh the costs and benefits of a particular policy or regulation.
...
But "it is no longer federal government policy to maintain a uniform estimate of the monetized impacts of greenhouse gas emissions," Jeffrey B. Clark, the acting administrator of the White House Office of Information and Regulatory Affairs, wrote in a May 5 memo.
...
Scientists and environmental groups say that the Trump administration is denying reality.
"It's very clear that climate change is causing harms to people in the United States and around the world, and that these harms are growing worse with increasing warming," said Robert E. Kopp, a climate scientist at Rutgers University. **"By effectively saying the social cost of carbon should be treated as zero, this policy arbitrarily and capriciously ignores the science and economics of climate change."**

Michael Greenstone, an economist at the University of Chicago who first came up with the idea of the social cost of carbon as a justification for climate policy, said the new guidance means "feelings, not facts" would guide federal policy.

These examples list federal agencies not named EPA. If you were to say that EPA declared it would no longer consider the social costs of pollution when crafting policy, you would be incorrect. You also seem to be conflating greenhouse gas emissions with criteria air pollutants that EPA is legally obligated to regulate: the Clean Air Act requires EPA to set National Ambient Air Quality Standards (NAAQS) for six commonly found air pollutants known as criteria air pollutants. These are: ozone, particulate matter, carbon monoxide, lead, sulfur dioxide, and nitrogen dioxide.

But we send out these fact-checking inquiries for a reason. Would you want to make us aware of any data or literature that refutes the idea that Mr. Zeldin and the EPA are overhauling or effectively doing away with the social costs of carbon? Are we misunderstanding what Mr. Zeldin meant by the greatest day of deregulation our nation has ever seen? Or are you suggesting that the above materials are accurate but Politico's phrasing is not? Happy to discuss further.

Good thing because you have no idea what you're talking about. You have a fundamental misunderstanding of the facts based on incorrect speculation from your sources, which are not accurate or precise in their understanding of EPA's statutory obligations.

ANSWERS TO ORIGINAL QUESTIONS

1. **"Under Trump, Lee Zeldin's EPA has declared that it will no longer consider the social costs of pollution when crafting policy. It has eliminated restrictions on mercury emissions, soot and haze, all of which are pollutants with well-documented links to neurological damage and respiratory illness. As a result, mercury will now continue contaminating our water, air and food, and air pollutants will worsen asthma, weaken immune systems and increase rates of cancers, heart disease and stroke. The EPA has, in fact, moved to revoke the legal basis for regulating greenhouse gases altogether. These are precisely the kinds of environmental toxins that pose systemic threats to human health." (https://www.politico.com/news/magazine/2025/04/02/rfk-jr-s-maha-movement-has-a-fatal-flaw-00263926)**

This is not accurate. On mercury, the 2024 MATS Amendments are not in effect (effective date is July 8, 2027). The effective 2012 MATS requirements remain in effect. The 2012 MATS has driven sharp reductions in harmful air toxic pollutants from coal- and oil-fired power plants. Data shows:

- 2021 mercury emissions from coal-fired EGUs were 90 percent lower than pre-MATS levels;
- Since 2010, acid gas HAP emissions have been reduced by over 96 percent; and
- Emissions of the non-mercury metals – including nickel, arsenic, and lead – have been reduced by more than 81 percent.

The Biden-Harris EPA stated in its 2024 residual risk and technology review that the 2012 MATS rule for coal plants provided an ample margin of safety to protect public health, which was retained in the current proposal. The Biden-Harris EPA's regulatory impact analysis also shows the 2024 MATS rule would result in net costs, not net benefits.

The public comment period on the proposal closes on August 11, 2025.

"No longer will the EPA view the goals of protecting our environment and growing our economy as binary choices. We will and we must choose both. Administrator Lee Zeldin announced his Powering the Great American Comeback initiative to better achieve the agency's statutory mission and as such the first pillar of this initiative is clean air, land, and water for EVERY American. In his first term, President Trump advanced conservation and environmental stewardship while promoting economic growth for families across the country and will continue to do so this term." – EPA spox

The Trump EPA has done incredible work to keep America clean, carrying out its core mission of protecting human health and the environment:

- The Administrator's priorities for EPA can be found here: EPA Administrator Lee Zeldin Announces EPA's "Powering the Great American Comeback" Initiative | US EPA
- On the 100th day of the Trump EPA, Administrator Zeldin announced 100 of Trump's environmental wins: 100 Days, 100 Environmental Accomplishments | US EPA
- On the 200th day of the Trump EPA, Administrator Zeldin announced 100 *more* of Trump's environmental wins: EPA Celebrates Another 100 Days with 100 More Pro-Environmental Actions | USA EPA
- Just last month, thanks to President Trump's leadership, Administrator Zeldin announced a 100% solution to the decades-old Tijuana River Sewage Crisis: United States and Mexico Reach Agreement to Permanently and Urgently End Decades-Long Tijuana River Sewage Crisis
- West Lake Landfill: After visiting St. Louis with Senator Hawley, Administrator Zeldin announced an expedited cleanup timeline for the stie. The update cuts nearly two years off of the initial draft timeline presented by PRP consultants for the West Lake site, outlining resource needs and actionable items to expedite the cleanup from a May 2029 excavation start date to a 2027 excavation start date.

In addition to all of this action in just 200 days, the Trump EPA proposed to rescind the 2009 Endangerment Finding. The Clean Air Act requires EPA to set National Ambient Air Quality Standards (NAAQS) for six commonly found air pollutants known as criteria air pollutants. These are: ozone, particulate matter, carbon monoxide, lead, sulfur dioxide, and nitrogen dioxide – this does not include greenhouse gases.

The EPA will not operate as an unconstitutional lawmaker, as it did under previous administrations. The EPA will follow the law.

As EPA Administrator Lee Zeldin said in an interview, "If Congress wants the EPA to be regulating the heck out of carbon dioxide, then they can put it into law. But even the Endangerment Finding itself in 2009 never individually studied carbon dioxide as an endangerment to public health and welfare. They had to do all these other mental leaps because they didn't have the science and the data to be able to make a direct connection."

2. **The EPA has also been slow to move on microplastics and PFAS, both substances of growing concern among scientists and the general public. These invisible but omnipresent chemicals are a priority for the MAHA movement, singled out in the White House report for further study and policymaking. The EPA, though, has delayed implementing a new standard to limit PFAS in drinking water and announced it would consider whether to raise the limits of acceptable PFAS levels in community water systems, while also slashing funding for more research on the substance's health effects. (https://www.vox.com/health/421349/trump-rfk-jr-maha-movement-epa-health)**

This is **categorically untrue**. It would be fearmongering and a disservice to your viewers to imply this at all. See the list of what EPA has accomplished in just 200 days on PFAS below:

"Building on the historic actions to address PFAS during the first Trump Administration, EPA is tackling PFAS from all of our program offices, advancing research and testing, stopping PFAS from getting into drinking water systems, holding polluters accountable, and more. This is just a fraction of the work the agency is doing on PFAS during President Trump's second term to ensure Americans have the cleanest air, land, and water." – EPA spox

Trump Administration Action
In April, U.S. Environmental Protection Agency (EPA) Administrator Lee Zeldin outlined upcoming agency action to address Per- and Polyfluoroalkyl Substances (PFAS). In this suite of actions, Administrator Zeldin announced a long list that included in part the designation of an agency lead for PFAS, the creation of effluent limitations guidelines (ELGs) for certain PFAS to stop these forever chemicals from entering drinking water systems, and initiatives to engage with Congress and industry to establish a clear liability framework that ensures the polluter pays and passive receivers are protected. This list is the first, not the last, of all decisions and actions EPA will be taking to address PFAS over the course of the Trump Administration.

In a May announcement, the Trump EPA launched the PFAS OUT initiative will enhance engagement on addressing PFAS by proactively connecting with every public water utility known to need capital improvements to address PFAS in their systems. EPA will share resources, tools, funding and technical assistance opportunities to help utilities meet the federal drinking water standards. PFAS OUT will ensure that no community is left behind as we work to protect public health and bring utilities into compliance with federal drinking water standards.

EPA continues to offer free water technical assistance (WaterTA) that provides services to water systems to improve their drinking water and help communities access available funding. EPA's WaterTA initiatives work with water systems nationwide to identify affordable solutions to assess and address PFAS, including PFOA and PFOS. EPA supports water systems in reducing PFAS and emerging contaminants (EC) in drinking water through a range of funding resources. In May, EPA announced the availability of $945 million in grants under the EC program that will go to states and territories to help small and disadvantaged communities address PFAS in their water.

EPA is supporting the U.S. Department of Justice in defending ongoing legal challenges to the PFAS National Primary Drinking Water Regulation with respect to PFOA and PFOS.

The agency determined that the process by which it promulgated the preliminary regulatory determinations simultaneously with the proposed regulation was inappropriate and may not comply with the statutory requirements of Safe Drinking Water Act for PFHxS, PFNA, HFPO-DA (commonly known as GenX), and the Hazard Index mixture of these three PFAS plus PFBS. Therefore, the agency intends to rescind the regulations and reconsider these regulatory determinations, ensuring the Agency's actions adhere to the Safe Drinking Water Act process. ***While EPA cannot pre-determine the outcome, it is possible that the result could be more stringent requirements.***

In 2019, the Trump EPA announced the PFAS Action Plan. This historic Plan responded to extensive public interest and input the agency received and represented the first time EPA built a multi-media, multi-program, national communication and research plan to address an emerging environmental challenge like PFAS. EPA's Action Plan identified both short-term solutions for addressing these chemicals and long-term strategies that will help provide the tools and technologies states, tribes, and local communities need to provide clean and safe drinking water to their residents and to address PFAS at the source—even before it gets into the water.

Here is an easily digestible list of actions the agency already announced to address PFAS:

Strengthening the Science

- Designate an agency lead for PFAS to better align and manage PFAS efforts across agency programs
- Implement a PFAS testing strategy under Toxic Substances Control Act (TSCA) Section 4 to seek scientific information informed by hazard characteristics and exposure pathways
- Launch additional efforts on air related PFAS information collection and measurement techniques related to air emissions
- Identify and address available information gaps where not all PFAS can be measured and controlled
- Provide more frequent updates to the PFAS Destruction and Disposal Guidance—changing from every three years to annually—as EPA continues to assess the effectiveness of available treatment technologies
- Ramp up the development of testing methods to improve detection and strategies to address PFAS

Fulfilling Statutory Obligations and Enhancing Communication

- Develop effluent limitations guidelines (ELGs) for PFAS manufacturers and metal finishers and evaluate other ELGs necessary for reduction of PFAS discharges
- Address the most significant compliance challenges and requests from Congress and drinking water systems related to national primary drinking water regulations for certain PFAS
- Determine how to better use RCRA authorities to address releases from manufacturing operations of both producers and users of PFAS
- Add PFAS to the Toxic Release Inventory (TRI) in line with Congressional direction from the 2020 National Defense Authorization Act
- Enforce Clean Water Act and TSCA limitations on PFAS use and release to prevent further contamination
- Use Safe Drinking Water Act authority to investigate and address immediate endangerment
- Achieve more effective outcomes by prioritizing risk-based review of new and existing PFAS chemicals
- Implement section 8(a)7 to smartly collect necessary information, as Congress envisioned and consistent with TSCA, without overburdening small businesses and article importers.
- Work with Congress and industry to establish a clear liability framework that operates on polluter pays and protects passive receivers

Building Partnerships

- Advance remediation and cleanup efforts where drinking water supplies are impacted by PFAS contamination
- Work with states to assess risks from PFAS contamination and the development of analytical and risk assessment tools
- Finish public comment period for biosolids risk assessment and determine path forward based on comments
- Provide assistance to states and tribes on enforcement efforts
- Review and evaluate any pending state air petitions
- Resource and support investigations into violations to hold polluters accountable

3. **The MAHA report says environmental chemicals may pose risks to children's health. Citing the National Institutes of Health, it said there's a "need for continued studies from the public and private sectors, especially the NIH, to better understand the cumulative load of multiple exposures and how it may impact children's health." Meanwhile, the administration has cut funding for related studies. (https://kffhealthnews.org/news/article/maha-make-america-healthy-again-report-chronic-disease-rfk-trump-funding-cuts/) We were able to confirm that at least three of these grants listed here (https://cfpub.epa.gov/ncer_abstracts/index.cfm/fuseaction/recipients.display/rfa_id/666) were terminated by the EPA and remain so.**

   Is there anything you would like to add or make us aware of, in response to those reported details? Are they accurate? Is there anything we're missing?

We refer you to HHS and NIH for the first part of this question. The MAHA Commission is a presidential commission, so we would also refer you to the White House for comment on that commission specifically.

Of the grants you are referring to in the link, five of them have been terminated: #840198, #840199, #840201, #840202, and #840209. Our comment: "Maybe the Biden-Harris Administration shouldn't have forced their radical agenda of wasteful DEI programs and 'environmental justice' preferencing on the EPA's core mission of protecting human health and the environment." – EPA spox

- **Do you have any additional responses you wish to provide or make us aware of at this time?**

As Administrator Zeldin said to mark the 200th day of the Trump EPA, "The Trump EPA is proving that we can protect the environment and Power the Great American Comeback. 200 days, 200 top environmental actions. This is the pace that motivates us. We will continue to do everything in our power to rack up environmental win after environmental win for the American people."

Thank you,
EPA Press Office

Hi there,

My name is Wynn, and I'm a producer at Last Week Tonight with John Oliver, a show on HBO. I wanted to write because for this week's segment, airing on Sunday (8/17) and taping the day prior, we're planning on airing a piece on the Make America Healthy Again movement. As one part of that, we may briefly mention the EPA and some recent policy changes at the agency that appear to be at odds with the MAHA movement's goals. Ahead of that, I wanted to reach out to give you a heads up and a chance to respond to some specific questions we have about details that may end up in our segment.

My questions are below. **Our deadline for a response,** should you choose to provide one, is **10 am ET on Thursday, August 14th.** Please let me know if there's anyone else I should forward these inquiries to.

Our deadline for a response, should you choose to provide one, is **10 am ET on Thursday, August 14th.** Let me know if you have any questions for me, or if there's anything you'd like to discuss on the phone.

Thanks for your time.

Best,

Wynn

Questions for the EPA

- In our segment, we'll likely focus on some recent developments at the EPA, many of which feel directly at odds with some of Mr. Kennedy's concerns about toxic chemicals and pollutants. We might cite the following reported details:
    1. "Under Trump, Lee Zeldin's EPA has declared that it will no longer consider the social costs of pollution when crafting policy. It has eliminated restrictions on mercury emissions, soot and haze, all of which are pollutants with well-documented links to neurological damage and respiratory illness. As a result, mercury will now continue contaminating our water, air and food, and air pollutants will worsen asthma, weaken immune systems and increase rates of cancers, heart disease and stroke. The EPA has, in fact, moved to revoke the legal basis for regulating greenhouse gases altogether. These are precisely the kinds of environmental toxins that pose systemic threats to human health." (https://www.politico.com/news/magazine/2025/04/02/rfk-jr-s-maha-movement-has-a-fatal-flaw-00263926)
    2. The EPA has also been slow to move on microplastics and PFAS, both substances of growing concern among scientists and the general public. These invisible but omnipresent chemicals are a priority for the MAHA movement, singled out in the White House report for further study and policymaking. The EPA, though, has delayed implementing a new standard to limit PFAS in drinking water and announced it would consider whether to raise the limits of acceptable PFAS levels in community water systems, while also slashing funding for more research on the substance's health effects. (https://www.vox.com/health/421349/trump-rfk-jr-maha-movement-epa-health)
    3. The MAHA report says environmental chemicals may pose risks to children's health. Citing the National Institutes of Health, it said there's a "need for continued studies from the public and private sectors, especially the NIH, to better understand the cumulative load of multiple exposures and how it may impact children's health." Meanwhile, the administration has cut funding for related studies. (https://kffhealthnews.org/news/article/maha-make-america-healthy-again-report-chronic-disease-rfk-trump-funding-cuts/) We were able to confirm that at least three of these grants listed here (https://cfpub.epa.gov/ncer_abstracts/index.cfm/fuseaction/recipients.display/rfa_id/666) were terminated by the EPA and remain so.

Is there anything you would like to add or make us aware of, in response to those reported details? Are they accurate? Is there anything we're missing?

- **Do you have any additional responses you wish to provide or make us aware of at this time?**

Thanks for your time. Let me know if you have any questions for me.

Best,
Wynn

Hi Brigit and EPA press team,

I hope you're all doing well. I'm working on an article about Freeport-McMoRan's copper smelter in Miami, Arizona, which President Trump exempted from compliance with EPA's copper rule last month.

The article will mention that Abigale Tardif, the principal deputy assistant administrator in EPA's Office of Air and Radiation, emailed with a lobbyist for Freeport-McMoRan about how the company could best position itself to obtain the presidential exemption under the Clean Air Act, according to emails obtained by the Environmental Defense Fund via the Freedom of Information Act.

I have attached those emails for your reference, and I was hoping you could answer the following questions. My deadline is currently set for **5pm ET tomorrow**, although it might be extended.

- Can you confirm whether Abigale Tardif had a call with the lobbyist for Freeport-McMoRan, Patrick Traylor, in March?
- How would EPA respond to criticism from environmentalists that these emails show a remarkable degree of coordination between the agency and one of the companies it regulates?

Please let me know and thank you for considering this request. I will also reach out to the White House regarding the presidential exemption.

Best,
Maxine

Subject: Flag (NOT PRESS): Clarification request for Presidential exemption of NESHAP for EO sterilizers

Team – Please see the below from a company following up on their exemption request. The company has reached out to the WH (not sure if the folks listed in the email are the correct points of contact). Please advise.

Incoming -
We are urgently trying to ascertain whether or not Andersen Scientific, Inc., made the 2-year Presidential extension for NESHAP EO contract sterilizers. I have been trying to contact John Reiten and Marc Marie at the White House, but have had no luck.

One of our clients is the sole provider of a **Department of Defense** drug for US soldiers, and so this is a matter of urgency. We are **not** on the Whitehouse list of contract sterilizers, and I am trying to get clarification if we are or are not, and if not, what can we do considering the risks this will put to a delicate resource used by the US Government.

Is there a contact I can reach to gain some clarification on whether we made this list, and if not, what we need to do for reconsideration?

Respectfully,

Hey Brigit – Please see the below from OCAP. Would you like the OAR IO to review?

See answer to Brigit's question below:

Per the Annex that the WH shared with EPA, which is now posted on our website (https://www.epa.gov/system/files/documents/2025-04/regulatory-relief-for-certain-stationary-annex-1.pdf), Talen Montana, LLC and NorthWestern Energy a. Affected Facility/Source: Colstrip Steam Electric Station Units 3 and 4 is covered by the President's exemption.

Not sure this needs to be routed through the OAR IO since OCAP was able to definitively answer Brigit's question, but let me know.

Thanks!
Jill

Good afternoon, Team –

Flagging an inquiry from CNN on MATS. The deadline is 2 p.m. Friday. Let me know if you'd like me to take any of this to the program.

Inquiry –
Hi, I'm working on a story for next week about the Trump administration's recent rollback of the Biden-era MATs rules and communities impacted by that rollback. The story is focused in part on the Colstrip power plant in Montana, and I had the following questions.

- Last year, Colstrip applied and was granted an exemption for pollution controls used by every other coal plant in the US, citing economic harms. Why did EPA exempt the plant from installing technology that's in widespread use by other power plants to control such pollution?
- Colstrip is mentioned in EPA's final rule as having some of the largest costs to comply with pollution controls of any plant in the nation — amounting to nearly half of the Biden-era rule's total compliance costs. How big of a factor was Colstrip's costs in EPA's rollback of the Biden-era rules?
- Critics of the rollback have pointed to concerns that the Biden-era MATs rule required something that 90% of coal plants were already complying with and wouldn't have presented significant added costs to plants. Do you have a response to that critique?
- Do you have any response to concerns from the local community and Montana public health experts about mercury pollution and other particulate pollution from the Colstrip power plant?
- Anything else you'd like to address?

I'm looking for a response by 2pm EST Friday, March 13.

Respectfully,

Hi, I'm working on a story for next week about the Trump administration's recent rollback of the Biden-era MATs rules and communities impacted by that rollback. The story is focused in part on the Colstrip power plant in Montana, and I had the following questions.

- Last year, Colstrip applied and was granted an exemption for pollution controls used by every other coal plant in the US, citing economic harms. Why did EPA exempt the plant from installing technology that's in widespread use by other power plants to control such pollution?
- Colstrip is mentioned in EPA's final rule as having some of the largest costs to comply with pollution controls of any plant in the nation — amounting to nearly half of the Biden-era rule's total compliance costs. How big of a factor was Colstrip's costs in EPA's rollback of the Biden-era rules?
- Critics of the rollback have pointed to concerns that the Biden-era MATs rule required something that 90% of coal plants were already complying with and wouldn't have presented significant added costs to plants. Do you have a response to that critique?
- Do you have any response to concerns from the local community and Montana public health experts about mercury pollution and other particulate pollution from the Colstrip power plant?
- Anything else you'd like to address?

I'm looking for a response by 2pm EST Friday, March 13.

Thanks,
Ella

EPA Releases Proposal for Commercial Sterilizers to Safeguard the Supply of Life-Saving Medical Tools

March 13, 2026

Contact Information

EPA Press Office (press@epa.gov)

WASHINGTON — U.S. Environmental Protection Agency (EPA) proposed amendments to the Biden-era 2024 National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities to ensure consistency with the law and gold standard science. EtO is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters—medical equipment that newborns, the elderly, and Americans undergoing surgery rely on daily to survive. EPA is concerned that the current Biden-era EtO emission standards actively threaten facilities' ability to sterilize equipment and jeopardize one of America's only options for a secure domestic supply chain of essential medical equipment. EPA is committed to a rulemaking process that follows the law, ensures that regulation will not put countless lives at risk, and advances the agency's core mission of protecting human health and the environment, including minimizing Americans' unnecessary exposure to EtO.

> *"This proposed rule shows EPA's strong commitment to protecting people's health while maintaining a stable domestic medical supply chain,"* ***said EPA Administrator Lee Zeldin****. "The Trump EPA is committed to ensuring life-saving medical devices remain available for the critical care of America's children, elderly, and all patients without unnecessary exposure to communities."*

Congress deliberately designed CAA section 112 with detailed implementation timelines and requirements for residual risk reviews of Maximum Achievable Control Technology (MACT) standards in NESHAP rules. In 2024, however, the Biden-Harris EPA took the unprecedented step of conducting a second, "discretionary" residual risk review despite already completing the residual risk review required by law within eight years of promulgating the NESHAP. This second risk review, done in apparent contravention of the best reading of the statute using an almost decade old risk-based value for EtO, led to the 2024 EtO Commercial Sterilizer Final Rule (2024 NESHAP). During and following the promulgation of the Biden-Harris Administration's 2024 NESHAP, the medical community, industry stakeholders and other federal agencies, including the U.S. Food and Drug Administration, raised serious concerns. These concerns included the feasibility of complying with the more stringent EtO emission standards and the significant impacts the requirements would have on maintaining a strong domestic supply chain for sterilized medical equipment essential to saving American lives. Commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S. every year—or 20 billion medical devices—with no viable alternative on the market.

As a result of the 2024 NESHAP, the Biden-Harris Administration was forced in January 2025 to establish a Presidential exemption process from the administration's own rule due to facilities' inability to meet required standards before compliance deadlines, and the grave risk that the closures of these facilities posed to American lives. In response to legal, scientific and policy concerns, including the critical medical supply chain issue the U.S. faced due to the 2024 NESHAP rule, the Trump EPA issued a press release on March 12,

2025, announcing its reconsideration of the 2024 NESHAP, and on March 21, 2025, formally granted voluntary reconsideration.

With this rule, EPA is proposing that section 112(f)(2) of the CAA prevents EPA from conducting more than the one risk review EPA completed in 2006. Therefore, the second risk review the Biden EPA conducted in 2024 violated the CAA and should never been completed. In line with congressional intent, EPA is proposing to remove the risk-based CAA section 112(f)(2) standards which justified the 2024 NESHAP. EPA is also proposing to change other requirements that were promulgated from the standards, including the requirement to use continuous emission monitoring systems, technology review standards for new aeration room vents (ARV), and requirements for permanent total enclosure. If finalized as proposed, the Trump EPA's rule would give facilities the choice between installing a new monitoring system or making adjustments to the 2024 EtO standards for technology review standards for new ARV where EtO is greater than ten tons per year. These changes better reflect the complexity of facilities and give them the flexibility to work to use safe and effective equipment to sterilize medical tools and devices without compromising clean air for all Americans. EPA is proposing to keep the 2024 NESHAP standards consistent with the CAA and that result in facilities installing attainable emission controls consistent with the latest required technology review. The Trump EPA is committed to following the law exactly as it is written, while also ensuring standards effectively protect human health and the environment.

Since 2016, new information, including new epidemiological studies, advancements in statistical methods related to dose-response modeling have continued to emerge. It is known that EtO is produced within the body via normal processes and additionally from tobacco smoke or other combustion processes. As part of this rulemaking, EPA is seeking comment on new information related to these sources of EtO exposure. EPA anticipates this information would be useful for updating the agency's understanding of EtO exposure and toxicity and determining whether the 2016 EtO IRIS value remains suitable for estimating risk to inform regulatory decision-making, including the proposed amendments announced today. The agency will also consider comments regarding the Texas Commission of Environmental Quality's 2020 finalized alternative assessment of EtO's toxicity and potential to cause cancer or other alternative values not yet considered by the agency.

EPA estimates that this proposed action would save approximately $630 million in costs over 20 years, or about $43 million annually, not including the immeasurable value of the countless lives that would be saved from lethal or significantly debilitating infections that would result without properly sterilized medical equipment.

EPA will accept public comments on this proposal for 45 days after it is published in the *Federal Register*. EPA will hold a virtual public hearing for this proposed action 15 days after publication in the *Federal Register*.

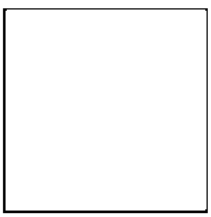
For more information about this rulemaking and further details about the public hearing, please visit here.

Background

EtO is a colorless gas that is critical to the medical device supply chain. The EtO Commercial Sterilization NESHAP regulates EtO emitted from commercial sterilization facilities. Commercial sterilization covers the sterilizer process that uses EtO to sterilize or fumigate materials such as medical equipment and supplies, spices, and other miscellaneous products and items. This process is designed to eliminate microorganisms

including bacteria, viruses, fungi, and protists from products to ensure they are safe for human use and consumption.

EtO sterilization plays a key role in the medical device supply chain, sterilizing a variety of devices ranging from general health care items, such as wound dressings, to specialized devices, such as stents. For many heat- and moisture-sensitive products, EtO sterilization is the only method that effectively sterilizes a product without damaging it.



Today, there are about 90 commercial sterilization facilities owned and operated by approximately 50 companies. EPA issued the original NESHAP under section 112(d) of the CAA in 1994, establishing emission limits for sterilization chamber vents, ARVs, and catalytic oxidizer vents (CEVs). In 2001, EPA revised the NESHAP to remove requirements for CEVs due to equipment failure. In 2006, EPA finalized a residual risk and technology review under CAA sections 112(f)(2) and (d)(6) with no further changes. On April 5, 2024, EPA finalized amendments to the EtO Sterilizers NESHAP based on the results of a residual risk and technology review outside the scope of CAA statutory authority.

Subject: RE: Bloomberg News request about EPA's Sterilizer rule reconsideration

Minus OMR, ended up crafting this with input from Juliet and Harry. Molly and Mike are you ok with this? Thoughts on my link in the answer to the 4th question?

- **EPA still recognizes ethylene oxide as a highly potent carcinogen, and the underlying science has not changed since the 2024 rule. Given that, can EPA confirm it is not rescinding the rule because the chemical is now considered less dangerous or because cancer risks have declined?**

Ex. 5 Deliberative Process (DP)

- **Does EPA agree that, without the 2024 rule, many people, including children, will face elevated lifetime cancer risks from sterilization facilities, and that the rule was expected to reduce those risks dramatically, including eliminating the highest-risk exposures?**

Ex. 5 Deliberative Process (DP)

- **If the science and risk findings are unchanged, what is the primary basis for repealing the rule—specifically, is EPA relying on a reinterpretation of the Clean Air Act or placing greater weight on costs and industry burden?**

Ex. 5 Deliberative Process (DP)

Ex. 5 Deliberative Process (DP)

- Why is EPA willing to accept higher cancer risks than the rule would have prevented, despite its own findings that the rule would cut ethylene oxide emissions and cancer risk by more than 90% for nearby communities?

Ex. 5 Deliberative Process (DP)

- What technological barriers justified last year's presidential exemptions for 40 sterilization facilities, and how does EPA justify easing standards for facilities that have already demonstrated they can meet the stricter requirements?

Ex. 5 Deliberative Process (DP)

Dear Brigit Hirsch and other EPA press team members,

My Bloomberg News colleague Leslie Kaufman, cc'ed here, and I are writing about EPA's recent proposed reconsideration of the 2024 rule, National Emission Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities, announced in Mid-March, and what this could mean for communities living near such facilities. We have a series of questions for EPA detailed below. Our deadline is end of day Monday, March 30.

- EPA still recognizes ethylene oxide as a highly potent carcinogen, and the underlying science has not changed since the 2024 rule. Given that, can EPA confirm it is not rescinding the rule because the chemical is now considered less dangerous or because cancer risks have declined?

- Does EPA agree that, without the 2024 rule, many people, including children, will face elevated lifetime cancer risks from sterilization facilities, and that the rule was expected to reduce those risks dramatically, including eliminating the highest-risk exposures?

- If the science and risk findings are unchanged, what is the primary basis for repealing the rule—specifically, is EPA relying on a reinterpretation of the Clean Air Act or placing greater weight on costs and industry burden?

- Why is EPA willing to accept higher cancer risks than the rule would have prevented, despite its own findings that the rule would cut ethylene oxide emissions and cancer risk by more than 90% for nearby communities?

- What technological barriers justified last year's presidential exemptions for 40 sterilization facilities, and how does EPA justify easing standards for facilities that have already demonstrated they can meet the stricter requirements?

We look forward to hearing EPA's responses. Again, our deadline is end of day Monday, March 30. If you have any questions or comments, please feel free to call Zahra's cell at (202) 352-0557.

Thanks,
Zahra Hirji & Leslie Kaufman

Cc: Leslie Kaufman (BLOOMBERG/ NEWSROOM/)
Subject: RE: Bloomberg News request about EPA's Sterilizer rule reconsideration

Zahra,

The Trump EPA is focused on advancing the agency's core mission of protecting human health and the environment, including minimizing Americans' unnecessary exposure to EtO. Is Bloomberg aware that commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S. every year—or 20 billion medical devices—with no viable alternative on the market? EtO is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters—medical equipment that newborns, the elderly, and Americans undergoing surgery rely on daily to survive. The 2024 rule posed a real threat to one of America's only options for a secure domestic supply chain of essential medical equipment. In fact, the Biden-Harris Administration was forced in January 2025 to establish a Presidential exemption process from the administration's own rule due to

facilities' inability to meet required standards before compliance deadlines, and the grave risk that the closures of these facilities posed to American lives.

The Trump EPA is proposing that section 112(f)(2) of the Clean Air Act (CAA) prevents EPA from conducting more than the one risk review EPA completed in 2006. In 2024, however, the Biden-Harris EPA took the unprecedented step of conducting a second, "discretionary" residual risk review despite already completing the residual risk review required by law within eight years of promulgating the NESHAP. Therefore, the second risk review the Biden EPA conducted in 2024 violated the Clean Air Act and should never been completed. In line with congressional intent, EPA is proposing to remove the risk-based CAA section 112(f)(2) standards which justified the 2024 NESHAP. It is important to note; EPA is proposing to keep the 2024 NESHAP standards consistent with the CAA and that result in facilities installing attainable emission controls consistent with the latest required technology review.

The Trump EPA is committed to making decisions based on gold-standard science and nothing less. Since 2016, new information, including new epidemiological studies, advancements in statistical methods related to dose-response modeling have continued to emerge. The Trump EPA acknowledges the uncertainty around the 2016 IRIS toxicity value for EtO. As part of this rulemaking, EPA is seeking comment on new information related to these sources of EtO exposure. It is known that EtO is produced within the body via normal processes and additionally from tobacco smoke or other combustion processes. The agency will also consider comments regarding the Texas Commission of Environmental Quality's 2020 finalized alternative assessment of EtO's toxicity and potential to cause cancer or other alternative values not yet considered by the agency. EPA anticipates this information will be useful for updating the agency's understanding of EtO exposure and toxicity and determining whether the 2016 EtO IRIS value remains suitable for estimating risk to inform regulatory decision-making, including the proposed amendments.

In terms of presidential exemptions, the Clean Air Act section 112(i)(4) authorizes the President to exempt any stationary source from a relevant standard if he "determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." EPA played no role in the determinations set out in the statute and specifically vested in the President. Any requests sent to the EPA's electronic mailbox were forwarded to the White House, and any further questions about process and decisions should be directed to the White House.

On July 17, 2025, President Trump signed the Proclamation, "Regulatory Relief for Certain Stationary Sources to Promote American Security with Respect to Sterile Medical Equipment". This Proclamation exempted 39 facilities from compliance with the 2024 Final Rule. The Presidential exemption is for a period of 2 years beyond the 2024 Final Rule's compliance dates. During the exemption period, facilities that were subject to the Commercial Sterilization Facilities NESHAP in effect prior to the issuance of the 2024 Final Rule must continue to comply with previously existing standards.

Dear Brigit Hirsch and other EPA press team members,

My Bloomberg News colleague Leslie Kaufman, cc'ed here, and I are writing about EPA's recent proposed reconsideration of the 2024 rule, National Emission Standards for Hazardous Air Pollutants (NESHAP) for Ethylene Oxide (EtO) Commercial Sterilization Facilities, announced in Mid-March, and what this could mean for communities living near such facilities. We have a series of questions for EPA detailed below. Our deadline is end of day Monday, March 30.

- EPA still recognizes ethylene oxide as a highly potent carcinogen, and the underlying science has not changed since the 2024 rule. Given that, can EPA confirm it is not rescinding the rule because the chemical is now considered less dangerous or because cancer risks have declined?

- Does EPA agree that, without the 2024 rule, many people, including children, will face elevated lifetime cancer risks from sterilization facilities, and that the rule was expected to reduce those risks dramatically, including eliminating the highest-risk exposures?

- If the science and risk findings are unchanged, what is the primary basis for repealing the rule specifically, is EPA relying on a reinterpretation of the Clean Air Act or placing greater weight on costs and industry burden?

- Why is EPA willing to accept higher cancer risks than the rule would have prevented, despite its own findings that the rule would cut ethylene oxide emissions and cancer risk by more than 90% for nearby communities?

- What technological barriers justified last year's presidential exemptions for 40 sterilization facilities, and how does EPA justify easing standards for facilities that have already demonstrated they can meet the stricter requirements?

We look forward to hearing EPA's responses. Again, our deadline is end of day Monday, March 30. If you have any questions or comments, please feel free to call Zahra's cell at (202) 352-0557.

Thanks,

Zahra Hirji & Leslie Kaufman

Hi Aaron and Abbie,

Please see the attached external meeting request from National Lime Association re: Compliance Deadline & Reconsideration of the Lime Manufacturing NESHAP.

This meeting request was vetted with OAQPS and the recommendation is: Ex. 5 Deliberative Process (DP)
Ex. 5 Deliberative Process (DP)

Reason for recommendation: Ex. 5 Deliberative Process (DP)
Ex. 5 Deliberative Process (DP)
Is there a timing consideration? No
Is a pre-brief needed? No
Recommended program office attendees (if applicable): [redacted]
Caution: Ex. 5 Deliberative Process (DP)

Please confirm if you agree with the provided recommendation.

Thanks!
Jessica

Jessica-

Please let Bracewell know if they would like to discuss the Presidential Exemption they should reach out to the White House as we play no role in this. I am happy to meet with Bracewell on the HON with program staff.

They should send an updated meeting request.

Best,
Abbie

Re: Extension Request Under the National Emissions Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review, 89 Fed. Reg. 24,090 (April 5, 2024)

Dear Mr. Patefield:

Solventum Corporation ("Solventum") submits this request for an extension of certain compliance periods in the final rule issued by the United States Environmental Protection Agency ("EPA") entitled "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review" published in the Federal Register on April 5, 2024 (89 Fed. Reg. 24,090) (the "Sterilizer Rule"). Specifically, pursuant to 40 CFR 63.6(i)(4)(i) (standards established under Clean Air Act section 112(d)), Solventum requests a one-year extension of the compliance periods for certain of the Sterilizer Rule's requirements applicable to Solventum's facility in Brookings, South Dakota ("Solventum Brookings") located at 601 22nd Ave. S., Brookings, South Dakota, 57006. As described below, 112(d) authorizes the applicable requirements in the Sterilzer Rule and includes a compliance deadline of April 5, 2027.[1] Solventum requests a one-year extension to this deadline until April 5, 2028.

Solventum previously submitted the enclosed letter to you dated June 10, 2025 (the "June 2025 Letter") regarding compliance deadlines under the Sterilizer Rule. As Solventum described in its June 2025 Letter and in our prior discussions with Region 8, a one-year extension to all compliance deadlines in the Sterilizer Rule is warranted for several reasons. First, Solventum's contratct manufacturer (who uses EtO for sterilization at Solventum Brookings) plans to end its contract manufacturing relationship with Solventum next year, after which EtO use at Solventum Brookings is anticipated to be *below* the 100 lbs/year threshold in the Sterilizer Rule. Second, there is regulatory uncertainity regarding the compliance deadlines since EPA is now reconsidering the Sterilizer Rule. Third, President Trump recognized that a two-year exemption was warranted for several sources subject to the Sterilizer Rule because the rule "places severe burdens on commercial sterilization facilities" and the rule requires "compliance with standards premised on the application of emissions-control technologies that do not exist in a commercially viable form." *See* Regulatory Relief for Certain

[1] To the extent EPA believes that the compliance deadline for the applicable requirements in the Sterilizer Rule is April 2026, Solventum respectfully rquests that EPA review and respond to this extension request imminently.

ED_021114D_00002689-00001

Stationary Sources To Promote American Security With Respect to Sterile Medical Equipment, 90 Fed. Reg. 34747 (July 23, 2025)

Solventum has made good faith efforts to develop a compliance schedule for the Sterilizer Rule but additional time is needed to continue exploring planning, engineering, permitting and testing, if required. Accordingly, Solventum respectfully requests a one-year extension until April 5, 2028 to continue investigating feasible and effective installation of controls, if necessary, under the Sterilizer Rule.

This request is timely under 40 CFR 63.6(i)(4)(i)(B) because it is submitted on January 22, 2026, which is not later than 120 days prior to the affected source's compliance date. We appreciate your continued attention to this important matter.

I. Background on Solventum and the Standard Subject to this Request

Solventum is committed to enabling better, smarter, safer healthcare to improve lives. Through our people, solutions, and partnerships, we work to improve the health of the planet and human health. We care about the health of our communities and support them through our expertise, our solutions and philanthropy. We are deeply committed to continued compliance with environmental obligations and place care for health, safety, and the environment at the forefront of our business.

Solventum requests a compliance extension of the requirement that an existing SCV at a facility with EtO use of at least 1 tpy but less than 10 tpy continuously reduce emissions by 99.8 percent, and an extension of all associated regulatory requirements, including monitoring, recordkeeping, reporting, and testing (collectively, the "99.8% Reduction Requirement"). *See* Table 1 to Subpart O of Part 63. EPA cited to both section 112(d) **and** 112(f) as authorizing the standard for which Solventum requests this compliance extension. *See* Table 6, 89 Fed. Reg. at 24,098; see also id. at 24,100. Thus, as further detailed below, Solventum is requesting (and EPA is authorized to grant) a compliance extension pursuant to 40 CFR 63.6(i)(4)(i).

As described in the June 2025 Letter, Solventum Brookings contract manufactures an innovative microbiology plate test product called Petrifilm for the company Neogen. As part of the contract manufacturing process, Solventum uses EtO for sterilization of the Petrifilm products. However, Neogen plans to end its contract manufacturing relationship with Solventum Brookings in 2027, and after Neogen's departure EtO use at the Brookings facility is anticipated to be below 100 lbs/year.

Further, EPA is reconsidering the Sterilizer Rule - but has yet to issue a proposed rule, meaning there is no likelihood that a reconsidered final rule will be in place in the near term. As described in the most recent Status Report filed by EPA on December 29, 2025 in *Ethylene Oxide Sterilization Association Inc. v. EPA*, 24-180 (D.C. Cir.) (consolidated with *California Communities Against Toxics v. EPA*, 24-1178), EPA is reconsidering several aspects regarding the Sterilizer Rule and "intends to issue a proposed rule seeking public comment" and "expects to take final action by March 2026." This regulatory uncertainty with the Sterilizer Rule, coupled with the Presidential Exemption issued in July, increases the need for a compliance extension here.

ED_021114D_00002689-00002

II. EPA is Authorized to Grant a Compliance Extension Pursuant to 40 CFR 63.6(i)(4)(i).

The standard for which Solventum seeks a compliance extension pursuant to 40 CFR 63.6(i)(4)(i) is the 99.8% Reduction Requirement. *See* Table 1 to Subpart O of Part 63. In the Sterilizer Rule, EPA said that it promulgated this standard pursuant to both 112(f) and 112(d). *See* Table 6, 89 Fed. Reg. at 24,098; *see also id.* at 24,100 ("we are finalizing the following EtO emissions standards under CAA section 112(f)(2): . . . 99.8 percent reduction for SCVs at facilities where EtO use is at least 1 tpy but less than 10 tpy"); *see also id.* ("to satisfy the requirements of CAA section 112(d)(6), we are revising the standards to include . . . 99.8 percent reduction for SCVs at facilities where EtO use is at least 1 tpy but less than 10 tpy.").

Because 112(d) is a basis for EPA's authority to promulgate this standard, EPA is authorized to grant a compliance extension for the standard under 40 CFR 63.6(i)(4)(i)(A) ("The owner or operator of an existing source who is unable to comply with a relevant standard established under this part pursuant to section 112(d) of the Act may request that the Administrator (or a State, when the State has an approved part 70 permit program and the source is required to obtain a part 70 permit under that program, or a State, when the State has been delegated the authority to implement and enforce the emission standard for that source) grant an extension allowing the source up to 1 additional year to comply with the standard, if such additional period is necessary for the installation of controls."). Accordingly, Solventum is requesting a one-year extension from April 5, 2027 to April 5, 2028 to comply with the 99.8% Reduction Requirement. EPA has broad regulatory and dual authority under Section 112(d) and 112(f)[2]. 112(d) is a valid source of authority for the 99.8% Reduction Requirement and, as such, the underlying compliance date should be considered to be April 5, 2027. *See* 89 Fed. Reg. at 24,103.

III. An Extension of the Compliance Period is Necessary for the Installation of Controls.

EPA is authorized to grant a request for a one-year extension pursuant to 40 CFR 63.6(i)(4)(i) if such period is necessary for the installation of controls. Control technology must be feasible to be considered reasonably available to regulated entities. As noted above, Neogen is expected to relocate its operations out of Solventum Brookings. After Neogen's departure, Solventum Brooking's EtO usage is anticipated to be below 100 lbs/year, below the 1 ton per year threshold triggering the 99.8% Reduction Requirement.

Solventum Brookings currently achieves a 99% control rate for EtO emissions through use of a catalytic oxidizer.[3] The 99.8% Reduction Requirement would require Solventum to install a new dry bed scrubber system which requires significant planning, design engineering, permitting and testing to accomplish safely and effectively. In addition, compliance with the 99.8% Reduction Requirement will require Solventum to spend over $4.4 million – equating to an incremental cost of control of $245 million per ton of EtO. Considering the technical complexity of installation of the dry bed scrubber at

[2] EPA arguably lacks the statutory authority to conduct a secondary residual risk review under 112(f)(2), which mandates a one-time risk review contingent on a specific sequence of prerequisites. *See* 112(f)(1); 112(f)(2)(A); *but see* 112(d)(6) (mandating, in contrast, a recurring technology review by EPA). EPA previously conducted a residual risk review for the source category in 2006. *See* 71 Fed. Reg. 17,712 (April 7, 2006).

[3] EPA's residual risk assessment conducted as part of the Sterilizer Rule found that Brookings Solventum posed a risk of only 4-in-1M, well below EPA's presumptive threshold of acceptability of 100-in-1M, *before* the application of controls required by the Sterilizer Rule.

Solventum Brookings, the impending departure of Neogen, and the current state of regulatory uncertainty for the source category, an extension of the deadline is warranted to consider whether controls needed to comply with the 99.8% Reduction Requirement will be necessary.

IV. Solventum has Prepared a Compliance Schedule for the Installation of Controls.

A request for extension pursuant to 40 CFR 63.6(i)(4) must include a "description of the controls to be installed to comply with the standard; [and a] compliance schedule, including the date by which each step toward compliance will be reached." The request must include:

> (*1*) The date by which on-site construction, installation of emission control equipment, or a process change is planned to be initiated; and
> (*2*) The date by which final compliance is to be achieved.
> (*3*) The date by which on-site construction, installation of emission control equipment, or a process change is to be completed; and
> (*4*) The date by which final compliance is to be achieved.

40 CFR 63.6(i)(6).

As described above, installation of the dry bed scrubber needed to comply with the 99.8% Reduction Requirement involves significant planning, engineering, permitting and testing. The significant time and money expenditures required for compliance are unreasonable considering Neogen's impending departure and EPA's pending reconsideration action. Nonetheless, Solventum is developing the following contingent compliance schedule with good faith efforts toward compliance if required. In accordance with 40 CFR 63.6(i)(6), these dates are as follows:

- **The date by which on-site construction, installation of emission control equipment, or a process change is planned to be initiated – ONGOING NOW**
  Solventum is currently engaged in the planning and implementation of the emission controls, including discussions with outside vendors and consultants.

- **The date by which on-site construction, installation of emission control equipment, or a process change is to be completed - FEBRUARY 5, 2028**

- **The date by which final compliance is to be achieved – APRIL 5, 2028**

The dates provided herein are preliminary estimates based on Solventum's current knowledge of facility operations and past experience implementing similar control measures. Although the estimates provided are good faith approximations of the time necessary, these projects could take significantly longer to implement. Solventum makes no commitment to meet these preliminary minimum estimates.[4]

[4] Solventum reserves the right to seek such additional relief from the Sterilizer Rule's compliance deadlines as may be available under the law, both concurrently and following this request.

V. Conclusion

As set forth herein, an extension of the compliance period set by the Sterilizer Rule is necessary for the installation of controls and will not result in any unacceptable risk from Solventum Brookings. Therefore, Solventum respectfully requests an extension of the compliance deadline for the 99.8% Reduction Requirement to April 5, 2028.

Thank you for your attention to this request. Solventum is available to meet with EPA to discuss further if you need any additional information.

Sincerely,

Jay Small, CSP
Vice President Global Environmental Health & Safety

RE:

Request by Solventum Corporation for a Clean Air Act Compliance Extension Under the National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review (89 Fed. Reg. 24,090; April 5, 2024)

Dear Mr. [redacted],

Pursuant to 40 CFR 63, Subpart A, §63.6(i)(3) and §63.6(i)(4)(ii), "Request for extension of compliance" for a relevant standard established under Federal Clean Air Act Section 112(f) "Standard to protect health and environment", Solventum Corporation ("Solventum") requests an extension of compliance of up to two years after the effective date of the National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review (89 Fed. Reg. 24,090; April 5, 2024) (the "Sterilizer Rule"). Please note that Solventum is not seeking a compliance extension under the Presidential Exemption process that was announced in March 2025.

For the reasons highlighted in this letter, Solventum believes it is necessary and appropriate for the United States Environmental Protection Agency Region 8 ("US EPA") to grant an Extension of Compliance under 40 CFR 63, Subpart A, §63.6(i)(3) and §63.6(i)(4)(ii) for the ethylene oxide ("EtO") emission standards and limitations for Solventum's facility in Brookings, South Dakota ("Solventum Brookings").

Solventum strives to advance healthcare solutions that improve lives. Through our people, solutions, and partnerships, we work to improve the health of the planet and human health. We care about the health of our communities and support them through our expertise, our solutions and philanthropy. We are deeply committed to continued compliance with

environmental obligations and place care for health, safety, and the environment at the forefront of our business.

Solventum Brookings currently operates EtO emission controls that have consistently demonstrated a control efficiency exceeding 99%, in full compliance with current EtO NESHAP, 40 CFR 63.362(c), as documented by the testing results submitted to EPA Region 8 for Petrifilm on April 27, 2018, and for Attest on June 20, 2019. Solventum remains fully committed to upholding compliance with all current and future air emission regulations at the Brookings facility.

As Region 8 is aware, in addition to the reasons set forth below on the need for a compliance extension, the current EtO emissions standards and limitations are in flux. US EPA has announced that the current rule is under active reconsideration in light of the Trump Administration regulatory reduction activities. Also, as set forth in the case *Ethylene Oxide Sterilization Association Inc. v. EPA*, 24-180 (D.C. Cir.) (consolidated with *California Communities Against Toxics v. EPA*, 24-1178) the Sterilizer Rule has been appealed and US EPA is required to provide the court with a status update by June 30th and every ninety days thereafter while the Sterilizer Rule is under reconsideration. Solventum believes that the regulatory uncertainty with the Sterilizer Rule increases the need for a compliance extension.

As detailed below, an Extension of Compliance is warranted for Solventum Brookings because the technology needed is neither practical nor reasonable. Per EPA's guidance, Solventum submits the following information in Part I (Individual Facility Information): (A) emission standards or limitations subject to the request; and (B) length of compliance period request. Supporting information justifying this request follows in Part II.

We request the U.S. EPA Region 8 Administrator swiftly consider and issue an Extension of Compliance because the technology to implement the standard is not available given the practical and cost challenges to plan, procure, and install required control technologies within the current compliance timeframe.

I. INDIVIDUAL FACILITY INFORMATION

The affected Section 112(f) stationary source (facility) is located at 601 22nd Ave. S, Brookings, South Dakota 57006. This facility is subject to Title V Site Operating Permit No. 28.9901-06, issued by South Dakota Department of Environment and Natural Resources.

Solventum Brookings contract/toll manufactures a high-tech, modern-day replacement for the laboratory petri dish. The product is sold by Neogen® company under the trade name Petrifilm AC ("Petrifilm®" or "Petrifilm® AC test kits") and is used by food and beverage producers as well as contract laboratories across the United States and around the world. A picture of the Petrifilm® product is included at Attachment A of this letter.

Petrifilm®'s easy-to-use microbiology plate tests have revolutionized the world of food safety. Petrifilm® plates are designed by scientists to help labs be more efficient while delivering

reliable and accurate test results. The finished product is critical to user's ability to prevent foodborne illness outbreaks.

As part of the contract manufacturing process, Solventum uses EtO to decontaminate Petrifilm® microbiology plates and prevent Petrifilm® plate contamination before shipment to customers. Petrifilm® is used by the Food and Drug Administration for milk laboratory analysis and has been assessed by the US Department of Agriculture Food Safety and Inspection Service.

Historically, Solventum Brookings has used just over 2,000 pounds per year ("lb/yr") [or 1 ton per year ("tpy")] of EtO in the production process. Based on historical usage, Solventum Brookings would be classified as a commercial sterilizing facility under the Sterilizer Rule with an April 2026 compliance deadline. Neogen®, the owner of the Petrifilm® brand and business, which is currently contract manufactured at Solventum Brookings, is building a new manufacturing facility in Michigan. When this operational change occurs (currently scheduled in the second half of 2026), we expect that Solventum Brookings' EtO usage will be below 100 lb/yr. Without the requested Extension of Compliance, Solventum Brookings would face costs exceeding $4.4 million to implement control technologies for incremental EtO removal and continuous emissions monitoring in an effort to meet the April 2026 deadline—without any guarantee of achieving compliance with the requirements of the revised MACT Subpart O.

Operational changes anticipated in the second half of 2026 would resolve the need to install such control technologies at Brookings since by that point, Solventum Brookings' EtO usage will be below 100 lb/yr. If an Extension of Compliance is not granted, Solventum Brookings will be required to invest over $4.4 million in additional emissions control technologies and continuous monitoring systems aimed at achieving only marginal reductions in EtO emissions. This expenditure comes despite the facility already demonstrating a proven control efficiency exceeding 99%, in full compliance with existing regulatory standards.

A. Emissions Standards or Limitations Subject to the Request

Solventum requests an Extension of Compliance from the obligations arising under the Sterilizer Rule. Given the complex requirements in the Sterilizer Rule, it is most appropriate to grant an Extension of Compliance with respect to the Sterilizer Rule in its entirety. More specifically, with respect to the specific individual emission standards and limitations within the Sterilizer Rule, we request that the following should be extended, along with their associated monitoring, reporting, and recordkeeping requirements:

40 CFR 63.362 (a): Compliance date
40 CFR 63.362 (b): Applicability of Standards
40 CFR 63.362 (c): Sterilization Chamber Vents
40 CFR 63.362 (d): Aeration Room Vents
40 CFR 63.362 (g): Group 1 Room Emissions
40 CFR 63.362 (g): Group 2 Room Emissions
40 CFR 63.362 (h): Capture Systems

40 CFR 63.362 (k): General Duty

B. Length of Compliance Period Requested.

Solventum requests a two-year Extension of Compliance from the applicable standards and limitations, in accordance with the provisions of 40 CFR 63, Subpart A, §63.6(i)(3) and §63.6(i)(4)(ii), with the possibility of renewal. For the Petrifilm® process, the requested extension would shift the compliance deadline from April 5, 2026, to April 5, 2028. For the Laboratory Sterilization process, the compliance deadline would be extended from April 5, 2027, to April 5, 2029.

II. JUSTIFICATION FOR EXTENSION OF COMPLIANCE REQUEST

A. The Technology to Implement the Above Standards Is Not Available.

The availability of technology is widely understood in environmental law frameworks to mean the conditions that allow a manufacturing facility to comply with regulatory requirements. Among other things, this requires the actual, real-time availability of the material inputs, equipment, personal protective gear, monitoring systems, validated test methods, and labor to service the technology. In addition, available technology is also understood to mean economic feasibility. Under the Clean Air Act, for example, a reasonably available control technology analysis considers whether control technology is reasonably available, including both technological and economic feasibility. In short, available technology must be practical and reasonable.

The control technology required to comply with the Sterilizer Rule is neither practical nor reasonable for implementation at Solventum Brookings. The Sterilizer Rule requires that fugitive EtO emissions from the room ventilation (Groups 1 and 2) must be captured through the installation of a permanent total enclosure (PTE), with the collected emissions directed to a control system that achieves 97% control efficiency for Group 1 vents and 86% control efficiency for Group 2 vents. After the exit of Neogen®'s Petrifilm business, expected in the second half of 2025, Solventum plans to meet the compliance requirement for Group 1 and Group 2 emissions by installing and operating a new dry bed scrubber system.

However, there is a technical concern regarding the ability to achieve high removal efficiencies when the inlet loading to the control system is extremely low, at parts per billion (ppb) or parts per trillion (ppt) levels. Given the expected ppb or ppt concentrations of EtO in the room air routed to the proposed dry bed scrubber system, it may not be feasible to verifiably achieve a 97% reduction, or an 86% reduction in EtO. While Solventum is willing to implement control technologies to address emissions from Group 1 and Group 2 vents, technology to implement the standard and demonstrate compliance with the requirements of the Sterilizer Rule is not available. This is particularly problematic if the exit concentrations fall below an instrument's detection range or if control technology does not exist to verify 97% control efficiency for Group 1 vents and 86% control efficiency for Group 2 vents. The technical challenge or infeasibility of

achieving high removal efficiency at such low inlet concentrations is well-documented and has been acknowledged by vendors of relevant control technologies.[1]

Finally, as noted, costs of over $4.4 million dollars are needed to support additional changes to control incremental EtO, that do not, at this time ensure compliance with the removal efficiencies required by the Sterilizer Rule. Therefore, control technology to implement the Sterilizer Rule is neither practical nor reasonable, and not available for low concentration Group 1 and Group 2 vent streams at Solventum Brookings.

B. The Sterilizer Rule Would Impose Extremely Costly Requirements That Are Not Justified By Emissions Reductions.

The uncontrolled emissions rate of EtO from the Petrifilm® process is 1.84 tpy (or 3,680 lb/yr). With a 99% control efficiency currently achieved using a catalytic oxidizer, the controlled emission rate is 0.0184 tpy (or 36.8 lb/yr). Installing control technology necessary to achieve an overall control efficiency of 99.8%, as required by the Sterilizer Rule, further drops the emission rate to 0.00368 tpy or (7.4 lb/yr). The difference between the 99% control efficiency and the 99.8% control efficiency is 0.015 tpy (or 30 lb/yr).

Accordingly, to seek to comply with the requirements of the Sterilizer Rule and achieve 99.8% control by the April 2026 deadline, Solventum will be required to invest over $4.4 million to install and operate the new dry bed scrubber system. On a dollar-per-ton basis, this translates to an incremental **cost of control** of **$245 million per ton of EtO**. As described above, we expect that Neogen will relocate to a new facility in Michigan, thus exiting the Solventum Brookings facility, in the second half of 2026, after the April 5, 2026, compliance deadline for commercial sterilizers using over 1 tpy of EtO. Although Solventum Brookings will remain subject to the Sterilizer Rule, its compliance obligations will reflect an EtO usage of less than 100 lb/yr, with a corresponding compliance deadline of April 5, 2027.

III. CONCLUSION

Solventum is committed to environmental compliance and being a trusted partner with those communities in which we operate. The Solventum Brookings facility has complied with previous EtO NESHAP regulations and currently operates emission control systems that have demonstrated at least 99% control efficiency for EtO. Solventum remains fully committed to maintaining compliance with all current and future air emission regulations at the Brookings site.

Because the technology to implement the Sterilizer Rule is not practical or reasonable, Solventum respectfully requests that the U.S. EPA Region 8 Administrator grant a two-year Extension of Compliance from the Sterilizer Rule to Solventum Brookings under 40 CFR 63, Subpart A, §63.6(i)(3) and §63.6(i)(4)(ii). To reiterate, for the Petrifilm® process, the requested

[1] Survey of Control Technologies for Low Concentration Organic Vapor Gas Streams. United States Environmental Protection Agency, EPA-456/R-95-003, May 1995.

extension would shift the compliance deadline from April 5, 2026, to April 5, 2028. For the Laboratory Sterilization process, the compliance deadline would be extended from April 5, 2027, to April 5, 2029.

Thank you for your attention to this request. Solventum is willing to meet at your convenience to discuss further.

Sincerely,
/s/ Jay Small
Jay Small, CSP
Vice President Global Environmental, Health & Safety

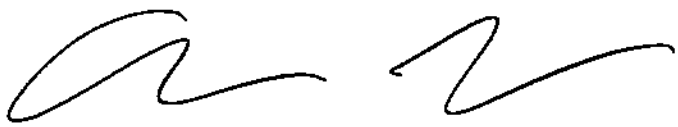
ASSISTANT ADMINISTRATOR FOR AIR AND RADIATION



WASHINGTON, D.C. 20460

April 3, 2026

MEMORANDUM

SUBJECT: Request for No Action Assurance and an Enforcement Statement Regarding Facilities Subject to the National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities, Residual Risk and Technology Review

FROM: Aaron Szabo
Assistant Administrator
Office of Air and Radiation

TO: Jeffrey Hall
Assistant Administrator
Office of Enforcement and Compliance Assurance

The Office of Air and Radiation (OAR) requests that the Office of Enforcement and Compliance Assurance (OECA) provide No Action Assurance (NAA) and an enforcement statement regarding provisions of the final rule titled "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities, Residual Risk and Technology Review" (2024 Final Rule), published on April 5, 2024 (89 FR 24090). Ethylene oxide (EtO) is the only safe and effective sterilization method available for many medical devices, making it indispensable for life-saving medical equipment including heart valves, pacemakers, surgical kits, gowns, drapes, ventilators, syringes, and catheters. Commercial sterilizers utilize EtO to sterilize 50 percent of all medical devices in the U.S every year with no viable alternative on the market. The EPA is concerned that the standards in the 2024 Final Rule impact facilities' ability to sterilize equipment and jeopardize one of America's only options for a secure domestic supply chain of essential medical equipment. OAR is seeking a bridge that provides enforcement discretion and greater certainty to industry until the Agency can finalize provisions in a proposed rule titled "National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review Reconsideration" (2026 Proposed Rule), published on March 17, 2026. This proposed rule was developed in response to Administrator Zeldin's March 12, 2025, announcement of planned deregulatory actions.[1] The discretion could be time-limited, expiring when a final rule becomes effective.

[1] *See* "EPA Launches Biggest Deregulatory Action in U.S. History," (March 12, 2025). Available at https://www.epa.gov/newsreleases/epa-launches-biggest-deregulatory-action-us-history (accessed December 10, 2025).

The 2024 Final Rule revised the Commercial Sterilization Facilities NESHAP (40 Code of Federal Regulations part 63, subpart O) based on a residual risk and technology review (RTR) pursuant to Clean Air Act (CAA) sections 112(f)(2) and 112(d)(6), respectively by specified compliance dates. Congress deliberately designed CAA section 112 with detailed implementation timelines and requirements for residual risk reviews. The residual risk review for this source category was originally conducted as part of the 2006 rulemaking. Despite already completing the residual risk review required by law, the 2024 Final Rule included an unprecedented second discretionary residual risk review. With the 2026 Proposed Rule, the EPA is proposing that CAA section 112(f)(2) prevents the Agency from conducting more than one risk review. Therefore, the 2024 risk review violated the CAA and should have never been completed. In line with congressional intent, the EPA is proposing to remove the risk-based 112(f)(2) standards set in the 2024 Final Rule. The 2026 Proposed Rule, if finalized, would also revise the standard promogulated under CAA 112(d)(6) for new aeration room vents (ARVs) where ethylene oxide (EtO) use is at least 10 tons per year (tpy), revise the compliance demonstration requirements to allow facilities to choose between parametric monitoring or using a continuous emission monitoring system, and rescind the requirement that permanent total enclosure (PTE) be used to ensure complete capture of EtO for Group 1 and Group 2 room air emission standards.

These changes address concerns raised by companies and trade associations. During and following the promulgation of the 2024 Final Rule, the medical community, industry stakeholders, and other Federal agencies, including the U.S. Food and Drug Administration, raised serious concerns regarding the feasibility of complying with the more stringent EtO emission standards and the impacts the requirements would have on maintaining a strong domestic supply chain for sterilized medical equipment. In response to legal, scientific, and policy concerns, the EPA issued a press release on March 12, 2025, announcing its reconsideration of the 2024 Final Rule, and on March 21, 2025, formally granted voluntary reconsideration. The EPA evaluated and granted the requests included in the 2026 Proposed Rule.

On July 17, 2025, President Trump signed the Proclamation "Regulatory Relief for Certain Stationary Sources to Promote American Security With Respect to Sterile Medical Equipment" (90 FR 34747).[2] This Proclamation exempted certain facilities, identified in Annex 1 of the Proclamation, from compliance with the 2024 Final Rule. The Presidential exemption is for a period of 2 years beyond the 2024 Final Rule's compliance dates. During the exemption period, facilities identified in Annex 1 that were subject to the Commercial Sterilization Facilities NESHAP, 40 CFR part 63, subpart O, in effect prior to the issuance of the 2024 Final Rule must continue to comply with those standards. Not all facilities subject to the 2024 Final Rule were aware of and applied for the Presidential exemption, additionally, not all facilities that applied were granted the exemption. As a result, there are an estimated 42 of the 89 facilities subject to the 2024 Final Rule that have an April 6, 2026, compliance date for the CAA 112(f)(2) emission standards (*see* Appendix 1).

The compliance date for the 2024 Final Rule standards promulgated pursuant to CAA section 112(f)(2) is currently April 6, 2026, we are requesting enforcement discretion on these standards, which are listed below:

[2] A copy of the Presidential Proclamation and Annex 1 are available in the rulemaking docket (Docket ID No. EPA-HQ-OAR-2019-0178).

ED_021114D_00002855-00002

- 99.8 percent reduction for new and existing SCVs at facilities where EtO use is at least 1 but less than tpy,
- 99.9 percent reduction for new and existing SCVs at facilities where EtO use is at least 10 but less than 30 tpy,
- 99.99 percent reduction for new and existing SCVs at facilities where EtO use is at least 30 tpy
- 99.6 percent reduction for existing ARVs at facilities where EtO use is at least 10 but less than 30 tpy,
- 99.9 percent reduction for existing ARVs at facilities where EtO use is at least 30 tpy,
- 99.9 percent reduction for new ARVs at facilities where EtO use is at least 30 tpy,
- 99.9 percent reduction for new and existing CEVs at area source facilities where EtO use is at least 60 but less than 400 tpy,
- 99.9 percent reduction for new and existing CEVs at area source facilities where EtO use is at least 400 tpy,
- 98 percent reduction for new and existing Group 1 room air emissions at area source facilities where EtO use is at least 40 tpy, and
- 98 percent reduction for new and existing Group 2 room air emissions at area source facilities where EtO use is at least 20 tpy.
- 80 percent reduction for new and existing Group 2 room air emissions at area source facilities where EtO use is at least 4 but less than 20 tpy.

After considering comments on the 2026 Proposed Rule, the EPA expects to finalize various forms of relief for these standards. OAR is requesting the following from OECA:

1. Provide an NAA now for the above-mentioned standards.
2. Consider additional NAAs for certain other provisions, for example, if we receive additional requests from affected entities and they demonstrate an inability to comply with the current requirements.
3. Issue an enforcement discretion statement for all provisions that the EPA proposed delaying or modifying.

The targeted and time-limited enforcement discretion we are seeking is in the public interest and would not jeopardize the EPA's efforts to both ensure the protection of health and the environment.

Enforcement Statement

OAR requests that OECA issue a statement noting we are aware of the circumstances and equities created by the Agency's decision to reconsider the 2024 Final Rule through the rulemaking process and are not intending to take enforcement action for noncompliance with the provisions that the EPA has proposed to revise in the 2026 Proposed Rule. Any statement should be clear that the EPA will continue to enforce provisions that would be unaffected by the 2026 Proposed Rule.

The regulatory uncertainty of the upcoming compliance dates and the delayed relief consistent with the 2026 Proposed Rule may cause supply shortage impacts. Being unable to adequately supply sterilized medical equipment to our medical personnel to safely treat patients in hospitals, operating rooms, and other medical facilities would undermine our national security. This uncertainty is expected

to cause economic burden for manufacturers, equipment installers, and in certain cases, potential end users.

If you have any further questions regarding this matter, please contact [redacted] at [redacted] or [redacted]i@epa.gov.

APPLICATION FOR PRESIDENTIAL EXEMPTION FOR CROSS GENERATING STATION AND WINYAH GENERATING STATION

In accordance with the procedures set forth by EPA,[1] Santee Cooper is submitting the following application for a Presidential Exemption under section 112(i)(4) of the Clean Air Act. The application requests a Presidential Exemption for the following coal-fired electric generating units (EGUs) that are owned and operated by Santee Cooper:

- Cross Generating Station, Units 1-4 located in Pineville, South Carolina with a total generating capacity of 2,390 MW, and

- Winyah Generating Station, Units 1-4 located in Georgetown, South Carolina with a total generating capacity of 1260 MW.

The Presidential Exemption expressly authorizes the issuance of a two-year extension of the compliance deadlines of the new requirements that EPA adopted on May 7, 2024, through the residual risk and technology review performed for affected coal-fired EGUs regulated by the Mercury and Air Toxics Standard Rule (MATS Rule).[2]

Prior Presidential Proclamation in Support of Santee Cooper's Application. On April 8, 2025, President Trump signed a Presidential Proclamation, entitled *Regulatory Relief for Certain Stationary Sources to Promote American Energy*. This Presidential Proclamation exempted over 100 existing coal-fired EGUs from compliance with all the applicable newly adopted MATS requirements for two years beyond its original compliance date. In effect, the Presidential Exemption issued extended for these units the MATS compliance date for two years from July 8, 2027, to July 8, 2029.

---

[1] The process for applying for a Presidential Exemption was set forth in a public notice posted on March 24, 2025, which provided specific guidelines on the information that should be included in an application. Although the guidance posted in the March 24 public notice can no longer be accessed through the current EPA website, this posting with the EPA guidance for applying for a Presidential Exemption is available at an alternative website .

[2] *See National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, 89 Fed. Reg. 38,508 (May 7, 2024).

In support of the Presidential Exemption issued in the April 8 Proclamation, the President made two determinations. The first was that the "technology to implement the [MATS] Rule is not available." This finding was based on a technical assessment that the "technology does not exist in a commercially viable form sufficient to allow implementation of and compliance with the [MATS] Rule by its compliance date of July 8, 2027." The second determination was that granting a two-year extension of the MATS compliance date under the Presidential Exemption was in "the national security interests of the United States." In support of this second determination, the President found:

> The [MATS] Rule places severe burdens on coal-fired power plants and, through its indirect effects, on the viability of our Nation's coal sector. Specifically, the Rule requires compliance with standards premised on the application of emissions-control technologies that do not yet exist in a commercially viable form. The current compliance timeline of the Rule therefore raises the unacceptable risk of the shutdown of many coal-fired power plants, eliminating thousands of jobs, placing our electrical grid at risk, and threatening broader, harmful economic and energy security effects. This in turn would undermine our national security, as these effects would leave America vulnerable to electricity demand shortages, increased dependence on foreign energy sources, and potential disruptions of our electricity and energy supplies, particularly in times of crisis.

Since the issuance of Presidential Proclamation on April 8, 2025, the White House has indicated that additional electric utilities will be afforded the same opportunity to apply for the Presidential Exemption. The CAA does not impose any deadline when applications for Presidential Exemptions must be submitted for consideration. Furthermore, the same technical bases for granting the two-year MATS compliance extension under the April 8 Proclamation remain for other coal-fired EGUs that may not yet have submitted applications for Presidential Exemptions granted to coal-fired EGUs on April 8 Proclamation. As discussed above, those technical bases are that the technology "does not exist in a commercially viable form" and compelling "national security interests" justify granting the time extension to avert many reliability and economic risks posed by the MATS Rule.

These same technical bases for issuing the April 8 Presidential Proclamation provide the grounds for the granting Santee Cooper's application to grant a two-year extension of the

MATS compliance dates through a Presidential Exemption issued under section 112(i)(4) of the Clean Air Act. Those grounds are further described below.

Further Technical Grounds in Support of Santee Cooper's Application. The MATS Rule has increased the stringency of the filterable particulate matter (fPM) limit by two thirds from 0.030 lb/MMBTU to 0.010 lb/MMBTU. Furthermore, it has eliminated all options for demonstrating compliance, other than using certified particulate matter continuous emissions monitoring systems (PM CEMS). Cross Units 1, 3 and 4 currently comply with the MATS fPM limit of 0.010 lb/MMBTU through periodic low mass emitter source testing. Cross Unit 2 and Winyah Units 1-4 comply using continuous parametric monitoring systems. Under the MATS Rule, all 8 of Santee Cooper's affected coal-fired units will be required to install and certify PM CEMS to demonstrate compliance with the new fPM standard of 0.010 lb/MMBTU on a 30-day rolling average basis by July 8, 2027.

Santee Cooper has begun to identify and move forward with additional technology upgrades and emission control measures to further reduce fPM emissions from affected Cross and Winyah Units. Achieving continuous (100 percent) compliance with the fPM limitation, however, is highly uncertain due to several technical uncertainties and challenges. Santee Cooper has initiated efforts to comply with this rule but has also identified multiple technical barriers to ensuring full compliance by the deadline. As discussed below, additional time is needed to be able to ensure 100 percent continuous compliance with PM CEMS and therefore provide strong grounds for the issuance of a Presidential Exemption for Cross Units 1-4 and Winyah Units 1-4.

First, Santee Cooper has a very limited historical dataset to evaluate a unit's ability to comply with the new limit on a 30-day rolling average basis. To determine if control device improvements or operational changes will be necessary for compliance, each unit must first install PM CEMS equipment, establish a correlation between the instrument and reference method measurements, and then collect adequate data to determine baseline performance.

Second, there is currently no guarantee that the strict correlation requirements of Performance Specification-11 can be achieved for these units. Correlation testing is extremely burdensome, requiring a minimum of 15 3-hour test runs per unit while varying PM loading. In some cases, an elevated PM loading may only be obtained by introducing an external source of PM to the flue gas (PM spiking) or obtaining controversial regulatory exemptions for control device detuning. If the data collected during a correlation testing program does not yield a valid correlation curve, a source cannot even begin to assess their

ability to comply with the standard let alone initiate potential capital improvements that may be required to ensure compliance and ultimately reliability.

In addition to overcoming these technical challenges, the implementation of the additional technology upgrades and emission control measures could require significant outages at all eight of the Cross and Winyah Units. Scheduling outages at these units will be another major challenge given the need to keep these units online to meet growing demands in electrical power in its service territory.

Like many utilities in the United States, Santee Cooper is facing significant load growth with limited options for meeting demand. The current deadline of the MATS Rule significantly threatens the reliability of existing reliable generating resources. Granting the two-year extension to these units under the Presidential Exemption will reduce the risk of these resources being unavailable to serve load in the event additional time is required to meet the fPM emission standard and/or the continuous monitoring requirements.

The importance of providing this relief is further underscored by the fact that both South Carolina and Santee Cooper are projecting very substantial increases in electricity load demand over the next five to ten years. In the case of Santee Cooper, this projected increase in power demand includes an additional 670 MW in generating capacity and 5,938,000 MWh in electricity on an annual basis by 2028, as compared to the current generating capacity and electricity production levels most recently forecasted for the Santee Cooper System in 2024 and 2028. This trend for strong increases in demand growth is forecasted to continue in future years through 2030 and beyond, with Santee Cooper projecting an annual need for an additional 1,037 MW in generating capacity and 9,450,000 MWh in electricity on an annual basis by 2030, and 1,516 MW in generating capacity and 13,085,000 MWh in electricity on an annual basis by 2035. This explosion of future electric demand further confirms the finding in the April 8 Presidential Proclamation that an extension of MATS compliance dates for an additional two years is in the interest of the national security interests of the United States.

Santee Cooper appreciates your consideration of this important matter. Please contact me regarding all matters pertaining to this application.

Attachments: MATS Rule Presidential Exemption - buckeye power.pdf

Aaron,

Two things on the 112 exemptions:

1. On MATS, I verified that we have not granted CPS Energy a petition previously. Also, there is one other MATS exemption request (from Buckeye Power) attached, that has not been granted. You may recall, this company sent us an e-mail but did not attach the correct exemption request so they resent it after the other MATS exemptions were granted. I am having the team double check to verify that there are no other unaddressed petitions for MATS.
2. I have not seen any e-mail from you re: other letters that need to be checked (per our discussion on Friday I was expecting something). Please let me know if I've missed something.

Enjoy your vacation.

Re: Request for Presidential Exemption of MATS Compliance Obligations
For CPS Energy Spruce Unit 1 and Spruce Unit 2 Coal Power Plants
Bexar County, Texas

CPS Energy is on schedule to cease the burning of coal at both its Spruce 1 and Spruce 2 generation units by 2028. Both plants are following the revised MATS emission standards. CPS Energy is submitting to the Environmental Protection Agency (EPA) the attached application seeking a Presidential Exemption for a two-year extension of the revised MATS compliance requirements under section 112(i)(4) of the Clean Air Act. The application seeks an extension to the revised MATS requirement that Particulate Matter Continuous Emission Monitoring Systems (PM CEMS) be installed. CPS Energy requests that it be able to continue operating under existing sampling methodology for the following reasons:

1) Both units will either be retired or converted to natural gas by 2028,
2) The units will continue to comply with the existing air emission permit limits that are protective of the environment, and
3) Any additional equipment required by the rules will only be used for a short period of time and creates a stranded investment once the plant is closured or converted.

On April 8, 2025, President Trump signed a Presidential Proclamation that provided MATS compliance extensions to many coal-fired generating units that had initially applied for the Presidential Exemption last March. However, it is our understanding that additional electric utilities will be afforded the same opportunity to apply for the Presidential Exemption through a second Presidential Proclamation that would be issued in the near term. CPS Energy requests that the EPA include in this second proclamation the attached application requesting a Presidential Exemption for CPS Energy's Spruce Units 1 and 2.

ED_021114D_00003035-00001

CPS Energy appreciates your attention on this important matter. Please contact Mr. Gregg Tieken at 210-837-2607 or GRTieken@CPSEnergy.com regarding all matters pertaining to CPS Energy's application.

Sincerely,

Curt D. Brockmann
Vice President, Compliance and Ethics

Application for Presidential Exemption for
Calaveras Power Plant, J.K. Spruce Units 1 and 2

In accordance with the procedures set forth by the EPA,[1] CPS Energy is submitting the following application for a Presidential Exemption under section 112(i)(4) of the Clean Air Act. The application requests a Presidential Exemption for Spruce Unit 1 and Unit 2, which are two coal-fired electric generating units located at the Calaveras Power Station in Bexar County, Texas.

The Presidential Exemption expressly authorizes the issuance of a two-year extension of the compliance deadlines of the new requirements that the EPA adopted on May 7, 2024, for affected coal-fired power plants regulated by the Mercury and Air Toxics Standard Rule (MATS Rule).[2]

CPS Energy is the largest publicly owned electric and natural gas utility in the United States, located in Bexar County, in south Texas. CPS Energy is seeking regulatory relief from rules imposed by the revised MATS rule for coal fired power plants.

CPS Energy requests no changes to emission standards or limits, instead we request a two-year extension to the updated MATS Rule requirement that PM CEMS be installed at both plants by July 2027. Spruce 1 is schedule for decommissioning in 2028 and Spruce 2 will cease burning coal in the fall of 2027, when it will be converted to 100% natural gas. The installation of the two PM CEMS would incur a stranded cost somewhere between $650,000 and $800,000.

Facility(ies) and/or affected source(s):

Spruce 1 and Spruce 2 coal power generation units are located at the Calaveras Power Plant, Bexar County, Texas.

Length of compliance period being requested

CPS Energy requests that the two plants be allowed to continue operating under the current MATS Low Emitting EGU (LEE) status for two years beyond the current end date of July 6, 2027. The MATS LEE status allows a reduced sampling frequency for stack testing for filterable particulate matter (fPM) in leu of installation of PM CEMS. By July 2029, both plants will either be converted to 100% natural gas or decommissioned. Incurring substantial capital costs and resources for the purchase, installation, and

[1] The process for applying for a Presidential Exemption was set forth in a public notice posted on March 24, 2025, which provided specific guidelines on the information that should be included in an application. Although the guidance posted in the March 24 public notice can no longer be accessed through the current EPA website, this posting with the EPA guidance for applying for a Presidential Exemption is available at an alternative website here.

[2] *See National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review*, 89 Fed. Reg. 38,508 (May 7, 2024).

certification of the PM CEMS would be a waste of limited resources to comply with requirements that will most likely be repealed and not replaced.

Provide a justification to support the request on the following two matters:

An explanation why the technology to implement the standard is not available:

CPS Energy requests that stack testing be allowed to demonstrate compliance with the applicable filterable particulate matter standards at both plants until each is either decommissioned or converted to 100% natural gas by July 2029. This is the most efficient and cost-effective technological approach for demonstrating compliance with the fPM performance standards.

An explanation why an extension is in the national security interests of the United States:

The installation of the PM CEMS for Particulate Matter monitoring does not reduce emissions but simply provides continuous monitoring. Currently fPM is monitored by stack tests. Generation readiness will be reduced as the installation of the PM CEMS requires shutting down the two large generation units, which are part of the baseload that generates a combined 1,340 MW at peak power. Additionally, the installation of PM CEMS requires a significant capital expense and will be obsolete in two years, if not earlier.

CPS Energy appreciates your attention on this important matter. Please contact Mr. Gregg Tieken at 210-837-2607 or GRTieken@CPSEnergy.com regarding all matters pertaining to CPS Energy's application.

Re: Sterilizer Rule (89 FR 24090): Steri-Tech Inc

I am writing on behalf of Steri-Tech Inc in Salinas, Puerto Rico to request that the President issue a two-year exemption according to his authority under Clean Air Act (CAA) Section 112(i)(4) for all emission standards and associated requirements created or revised in EPA's April 4, 2024 *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 FR 24090 (April 5, 2024) (Sterilizer Rule).

Steri-Tech requests that the President issue a two-year exemption as quickly as reasonable but designate it as taking effect on the compliance deadlines for the standards in the Sterilizer Rule. Specifically:

- For standards set or revised under CAA Section 112(f) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 6, 2026 (the compliance deadline for those standards);
- For standards set or revised under CAA Section 112(d) and all corresponding requirements (including monitoring requirements), the exemption should apply as of April 5, 2027 (the compliance deadlines for those standards).

As explained in the attached letter submitted to EPA on March 17 on behalf of the Ethylene Oxide Sterilization Association (EOSA), the technology necessary to implement the standards is not available because manufacturers cannot guarantee that existing emissions control equipment will enable sources to meet the new standards; there is not a sufficient supply of the necessary technology; and there are not enough experienced installation professional and technical experts to install and test that equipment within the current compliance timeframes.

As also explained in EOSA's March 17 letter, it is in the national security interests of the United States to issue the requested exemption because if some facilities choose to cease operations rather than attempt compliance (which is likely), that will disrupt the supply of sterilized medical devices, raise the cost of those devices, and/or force medical suppliers or providers to source sterilized medical devices from abroad.

Please don't hesitate to let me know if any additional information is needed. Steri-Tech Inc appreciates EPA's attention to this important matter and urges EPA to recommend that the President issue the requested exemption as quickly as reasonable.

Regards,

Giovanni R. Sánchez Cruz

The Ethylene Oxide Sterilization Association, Inc.
Managed by E&C Consortia Management, L.L.C.

The Honorable Lee Zeldin
Administrator
Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460
Mail Code: 1101A

Dear Administrator Zeldin:

I write on behalf of the Ethylene Oxide Sterilization Association (EOSA) to ask EPA to take near-term action regarding the *National Emission Standards for Hazardous Air Pollutants: Ethylene Oxide Emissions Standards for Sterilization Facilities Residual Risk and Technology Review*, 89 Fed. Reg. 24090 (Apr. 5, 2024), known as the "Sterilizer Rule." The Sterilizer Rule imposes extremely onerous ethylene oxide (EtO) emission standards on medical device sterilizers—the most stringent of which must be met by April 2026—and is causing substantial harm to and regulatory uncertainty for EOSA's members.

EPA announced on March 12, 2025, that it will reconsider the Sterilizer Rule (alongside other NESHAPs), which is a welcome development. EOSA was also pleased to see EPA's statement that the Administration "is considering a 2-year compliance exemption via Section 112(i)(4) of the Clean Air Act for affected facilities while EPA goes through the rulemaking process." But medical device sterilizers need to decide *now* whether to expend substantial resources to acquire technology and reconfigure their facilities to try to comply with the Sterilizer Rule—or to instead cease operations. That, in turn, may disrupt the supply of critical medical devices, harming both patients and providers, or force medical providers to source those essential medical devices from abroad—increasing the offshoring of the sterilization of medical devices and inflating costs to Americans in direct contravention of the Trump administration's economic objectives.

The Sterilizer Rule was promulgated by the Biden administration under Clean Air Act ("CAA") Section 112 on April 5, 2024. The Sterilizer Rule includes standards set under Section 112(d), the CAA's hazardous pollutant "technology review" provision, and Section 112(f), the "risk review" provision, the latter of which the D.C. Circuit described as a "*one-time* 'risk review.'" *Nat'l Ass'n for Surface Finishing v. EPA*, 795 F.3d 1, 5 (D.C. Cir. 2015) (emphasis added). There are several major flaws in the Sterilizer Rule, and a litany of other issues and errors.

First, the Sterilizer Rule unlawfully set new standards under Section 112(f) even though EPA previously undertook the one-time risk review for this source category in 2006. 71 Fed. Reg. 17, 712, 17,716 (April 7, 2006). In doing so, EPA ignored the statutory text and context, both of which indicate that Congress intended EPA to regulate primarily through periodic technology reviews under Section 112(d) and conduct only one round of risk-based review under Section 112(f). By ignoring that Congressional mandate, EPA wrongly avoided Section 112(d)'s requirement that the agency must consider costs when setting and revising technology-based standards.

Second, the emission standards set in the Sterilizer Rule—particularly under Section 112(f), but also those set under Section 112(d)—are extremely onerous, unsupported by the record data, and for some sterilizers will be impossible to meet. For example, EPA increased the standard for sterilization chamber vents using at least 30 tons per year ("tpy") of EtO from a 99% destruction

ED_021114D_00003046-00002

and removal efficiency (DRE) standard to a 99.99% DRE standard. This leaves no margin for error or equipment malfunction. Likewise, for aeration room vents ("ARVs") using at least 30 tpy of EtO, the Sterilizer Rule increased the DRE requirement from 99% to 99.9%, while wrongly rejecting commenters' request for an alternative standard. Both the SCV and ARV standards were premised on test data that EPA admitted, in the Proposed Rule, is not representative of normal operations. *See* 88 Fed. Reg. at 22,844. EPA also imposed stringent new standards on area sources; for example, EPA set a chamber exhaust vent emission standard of 99.9% DRE for facilities using at least 60 tpy of EtO. These are just a few of the stringent standards set in the Sterilizer Rule under Sections 112(f) and (d), all of which are unrealistic and unsupported by the record.

The Sterilizer Rule is also flawed because EPA arbitrarily and capriciously imposed onerous Continuous Emission Monitoring System (CEMS) mandates on facilities using at least 100 lb/year of EtO without proper notice and comment. Replacing parametric monitoring with CEMS, operating at fifteen-minutes intervals and demonstrating 90% data availability, is costly, complicated, and burdensome, while emission reduction benefits are minimal. Further, EPA failed to allow commenters to weigh in on the CEMS scheme the agency finalized, which requires application of CEMS *at each emissions inlet*, not just outlets. This CEMS scheme is thus both arbitrary and unlawful.

EOSA challenged the Sterilizer Rule in the United States Court of Appeals for the District of Columbia Circuit (No. 24-1180). In addition to raising the above major concerns, EOSA also explained that EPA wrongly set standards based on EtO *usage*, rather than based on EtO *emissions* (as the text of Section 112 requires); failed to establish technology-based standards under Section 112(d) before imposing certain of the risk-based standards; failed to consider and address comments on EPA's reliance on the flawed IRIS value for EtO; and failed to conduct rational cost/benefit analysis in deciding whether and to what extent to revise all standards. A fuller discussion of all of these issues can be found in EOSA's opening merits brief (Doc. #2080994).

As noted above, EPA has announced it will reconsider the Sterilizer Rule. EPA also recently moved to hold the litigation over the Sterilizer Rule in abeyance for 60 days "to allow new Agency leadership to review" the Sterilizer Rule and "to decide what action, if any, is necessary." *Cal. Cmtys. Against Toxics v. EPA*, No. 24-1178 (D.C. Cir. filed Feb. 18, 2025) (Doc. 2101209). EOSA appreciates EPA's recognition of the need to reconsider the Sterilizer Rule. But while EPA does so, EOSA's members continue to face the Sterilizer Rule's fast-approaching compliance deadlines: April 6, 2026, for standards set under Section 112(f) and April 5, 2027, for standards set under Section 112(d). These deadlines (particularly the former, which applies to the most stringent standards) require sterilizers to decide now whether to commit significant financial and operational resources—including to purchase new control technologies, redesign facilities, and restructure operations—to try to comply with the Sterilizer Rule, which is not possible for all facilities.

Lending further urgency to EPA's reconsideration of the Sterilizer Rule and the standards and deadlines set therein, the D.C. Circuit denied EPA's abeyance motion and the case has been set for argument on April 15, 2025. EOSA therefore urges EPA to act quickly to relieve sterilizers of the Sterilizer Rule's obligations, preventing unnecessary expenditures—and irrevocable decisions that some sterilizers will likely be forced to make absent near-term relief.

To address the urgent compliance challenges posed by the Sterilizer Rule, EOSA identifies two potential pathways for relief. Ideally, EPA should pursue both to ensure that sterilizers can continue to operate in the near term, even while EPA reconsiders the Sterilizer Rule more broadly.

Path 1: Presidential Waiver under Section 112(i)(4)

As suggested by EPA, the President should exercise his authority under CAA § 112(i)(4) to grant a two-year compliance exemption commencing on the Sterilizer Rule's compliance deadlines: April 6, 2026, for risk-based standards and April 5, 2027, for technology-based standards. The President may grant such an exemption for all sources regulated by the Sterilizer Rule in one action,[1] based upon findings that (1) "it is in the national security interests … to do so" and (2) "the technology to implement such standard is not available." 42 U.S.C. § 7412(i)(4).

The first requirement—national security interests—is satisfied due to the critical role that sterilization facilities play in maintaining the U.S. medical device supply chain. Compliance with the Sterilizer Rule's deadlines, particularly the two-year deadline for compliance with the risk-based standards set under Section 112(f), will significantly reduce sterilization capacity. This, in turn, will lead to severe shortages of life-critical medical devices such as catheters, surgical kits, syringes, bandages, IV equipment, and needles, disrupting essential healthcare services. EOSA cautioned in its Comments on the Proposed Sterilizer Rule that the loss of capacity while facility reconstruction and modifications are underway will cause "a large reduction in medical device sterilization capacity and a severe shortage of sterilized medical devices." EOSA Comments 59, EPA-HQ-OAR-2019-0178-0618. Medical industry stakeholders similarly noted that modifying sterilization equipment is "no trivial matter":

> These complex facilities, no two of which share the same design or process, typically must go at least partially offline to make modifications to the equipment. Even routine maintenance or periodic upgrades require significant planning to minimize downtime across the monthly or annual supply cycle.

Advanced Medical Technology Association Comments 9-10, EPA-HQ-OAR-2019-0178-0601.

Without relief, sterilizers may be unable to meet demand for sterilized medical devices, leading to shortages that force medical providers to seek alternative sources abroad and increase the United States' dependence on foreign suppliers for essential medical devices. This growing reliance on foreign sterilization capacity and imported medical equipment poses an immediate national security risk, as any disruption—whether from geopolitical conflicts, trade restrictions, or economic coercion—could severely limit the United States' ability to maintain an independent and resilient healthcare system, jeopardizing timely access to life-saving medical equipment.

[1] Nothing in Section 112(i)(4) bars the President from issuing an exemption that applies to all regulated sources—and the President should do so here to ensure that all sterilization facilities are relieved from the obligation to comply with the Sterilizer Rule.

The second requirement—technology unavailability—is also met. It will be impossible for all regulated sources to obtain and install necessary control technology by April 2026 due to the limited number of equipment manufacturers and workforce shortages.

EOSA has explained that many of the Sterilizer Rule's requirements "require significant facility reconstruction and major equipment procurement and installation" that could take years—particularly if all sterilizers must redesign their facilities and install equipment to meet the new standards at the same time. EOSA Comments 58–59. And "[t]he availability of the equipment, materials, and contractor services necessary to modify emission control systems is severely limited." Sterigenics Comments 28, EPA-HQ-OAR-2019-0178-0632. Between supply chain constraints, the time-intensive process of facility redesign to accommodate new equipment, and the extensive testing and validation required before any system can become operational, the necessary control technology is functionally unavailable within the required timeframes.

Further, even if it were possible for all facilities to secure the needed equipment and make the necessary design and structural changes within the current compliance periods, the limited number of experienced installation professionals and technical experts who support this industry makes timely compliance by all regulated sources logistically infeasible. *See* AdvaMed Comments at 10. There is simply no way that all regulated sources will be able to obtain both the necessary equipment *and* the skilled technicians needed to successfully install, test, and bring that equipment online within the same two-year period, as required under the Sterilizer Rule.

Finally, control device manufacturers cannot guarantee that their equipment will operate to meet the Sterilizer Rule's stringent performance deadlines. *See* Sterigenics Comments at 28. This further highlights the technological infeasibility of meeting the current compliance deadlines—as well as the irrationality and infeasibility of the standards themselves. This is a particularly compelling basis for the President to find that "the technology to implement such standard is not available," 42 U.S.C. § 7412(i)(4), and grant a two-year waiver.

Even the Biden Administration recognized the compliance challenges posed by the Sterilizer Rule. In its *Memorandum on the Orderly Implementation of the Air Toxics Standards for Ethylene Oxide Commercial Sterilizers* (Jan. 16, 2025), the Administration acknowledged that waivers or exemptions may be necessary to "achiev[ing] the … Rule's critical health protections as soon as practicable, while safeguarding the supply of safe medical products from disruption that would compromise the health and welfare of the American people."

EPA should therefore urge President Trump to exercise his authority under Section 112(i)(4) and quickly issue a two-year compliance exemption for all sources regulated under the Sterilizer Rule, effective when each set of standards set therein would otherwise apply. The exemptions then may be extended for one or more additional periods, if necessary.

Path 2: EPA Rulemaking to Stay or Extend Deadlines

Also or alternatively, EPA should take a near-term discrete administrative action to rescind the Rule 112(f) risk-based standards, or at least stay the compliance deadlines, based on a finding that the standards are likely unlawful and EPA's stated commitment to reconsider the Sterilizer Rule.

Because Section 112(f) allows EPA to grant no more than two years for compliance with risk-based standards (although, as discussed above, the President may issue a further two-year exemption—and should do so here), EPA should take near-term, discrete administrative action to rescind at least the risk-based standards set in the Sterilizer Rule based on a finding that its reliance on Section 112(f) to revise EtO emission standards was unlawful. EPA has a solid basis for taking that initial step now: under the Biden Administration, EPA ignored the statutory text and context, both of which confirm that the risk-review is (as the D.C. Circuit previously stated), a "one-time" event, and therefore EPA's conduct of a second risk review was unlawful.

Alternatively, EPA could take a discrete administrative action to stay the Sterilizer Rule's compliance deadlines (ideally for all standards, but at least the Section 112(f) risk-based standards) pending completion of reconsideration and a new notice-and-comment rulemaking process to rescind, replace, or revise the Sterilizer Rule. Such action would relieve sterilizers of near-term compliance obligations and reduce the risk that many sterilizers will cease operations and thereby disrupt the supply of medical devices even while EPA is reconsidering the Sterilizer Rule.

Because the Sterilizer Rule is the result of a notice-and-comment rulemaking process, rescinding or revising the Sterilizer Rule—or even just staying the compliance deadlines—likely also requires rulemaking to minimize the chance that a reviewing court vacates such action. But EPA could invoke the Administrative Procedure Act's "good cause" exception to notice and comment because the key legal issue—whether EPA can conduct a second round of risk review for a source category—has already been subject to a notice-and-comment process, and it is a pure statutory construction question on which EPA can correct course now. Further notice-and-comment on that issue is thus "unnecessary," and it is also "impracticable" and "contrary to the public interest" given the urgency of the issue and the impact on the medical device supply chain. *See* 5 U.S.C. 553(b)(B). Or, EPA could issue an interim final rule rescinding at least the Section 112(f) standards and thereby obviating the nearest-term compliance deadlines. This option would allow further notice and comment, but still provide immediate relief for sterilizers facing the difficult choice whether to try to comply with the Sterilizer Rule—despite the near-impossibility of doing so—or cease operations and disrupt the domestic medical supply chain.

* * * *

EOSA appreciates EPA's commitment to reconsidering the Sterilizer Rule and addressing the concerns of regulated facilities. EOSA also appreciates the Agency's willingness to consider near-term actions, such as a Presidential exemption and/or discrete administrative action to address the Section 112(f) standards and associated compliance deadlines. As many facilities confront immediate investment decisions, regulatory clarity is essential. EOSA urges EPA to take timely action to ensure that sterilization facilities remain operational while advancing long-term regulatory solutions that balance public health objectives with industry feasibility.

Thank you for your consideration. Please feel free to contact me at mzhuang@be-em.com if you have any questions regarding this request.

Sincerely,

Meibao Zhuang
Senior Manager
Ethylene Oxide Sterilization Association

Just talked with Thune's staff. They are asking on behalf of a constituent – Pete Lien and Sons. They are wanting to know if the company applied for a presidential exemption under Section 112 of the CAA. If not, they are wanting to know if EPA is considering delaying implementation of the rule.

For awareness, here are the comments the company submitted on the Biden SNPRM.

Good morning,

The correspondences linked below are ready for your review and concurrence before moving to OCIR.

Staff in OAPPS worked with OCIR and OAQPS to use standard language along with parts of the FOIA response language which the IO has already approved. Three of the congressionals below are template responses for the President Exemption and one is a personalized response. See the attached incoming letters for reference.

After you concur, we will send to OCIR for their review and edits. At that point, we'll share any OCIR edits, and if they're acceptable, Abbie can sign at that time.

Thanks,
Rod

David,

Meant to mention this in last week's email. Just a reminder that Freeport-McMoRan Miami Inc. still needs a POTUS extension that will allow for reinvestment in their copper

smelting plant. Latest info is attached in the white paper. Let us know if you have any questions. Thanks.

Subject: RE: CPS Energy MATS Presidential Exemption Request

Aaron,

Two things on the 112 exemptions:

1. On MATS, I verified that we have not granted CPS Energy a petition previously. Also, there is one other MATS exemption request (from Buckeye Power) attached, that has not been granted. You may recall, this company sent us an e-mail but did not attach the correct exemption request so they resent it after the other MATS exemptions were granted. I am having the team double check to verify that there are no other unaddressed petitions for MATS.
2. I have not seen any e-mail from you re: other letters that need to be checked (per our discussion on Friday I was expecting something). Please let me know if I've missed something.

Enjoy your vacation.

Hi Abbie, I hope this email finds you well. You may recall that we met several times in the spring regarding regulatory matters impacting public utilities. I have a client that is now interested in pursuing a Presidential Exemption from complying with the MATS requirements. I know that EPA is moving to finalize a repeal of several of the updated requirements in the MATS RTR; however, our client remains concerned about the ability to install CEMS in such a short time frame on a unit that will be retired in the nearer term. Can you please share with me the person to whom such a request should be addressed? If a call would be better, I would be happy to schedule something. Thanks again for your consideration here. I look forward to hearing back from you or a member of your team.

Hi Abbie,

I hope you are doing well! It is nice to reconnect now that I am back in the private sector. I would love to find time to catch up soon, so please let me know when works best for you.

In the meantime, one of our clients filed an exemption request under the HON rule. Are you working on HON rule implementation at EPA? It woud be incredibly helpful to have greater clarity into the timing of the exemption process.

Thank you!

Aaron and Abbey – I am just checking in regarding the application for the presidential exemption that was submitted to EPA by Santee Cooper for its Cross and Winyah Generating Stations. As you can see from an attached email thread to you, Santee Cooper submitted its application to you on May 29. Could you please let me know the reason for not including the recent Presidential Proclamation to issue an exemption for the Cross and Winyah coal-fired units. Assuming that this may have been an oversight, please let me know what options may be available for obtaining an exemption for these Santee Cooper units in the near future.
Many thanks,
Stephen

From: Brian Lynch
Sent: Thursday, May 29, 2025 1:33 PM
To: szabo.aaron@epa.gov; tardif.abigale@epa.gov; airaction@epa.gov
Subject: Application for Presidential Exemption for Cross Generating Station and Winyah Generating Station

Mr. Szabo & Ms. Tardif,

Santee Cooper is submitting to EPA the attached application seeking a Presidential Exemption for its two coal-fired generating stations under section 112(i)(4) of the Clean Air Act. The application for a Presidential Exemption seeks a two-year extension of the MATS compliance deadlines for 8 coal-fired electric generating

units located in South Carolina at the Cross Generating Station and the Winyah Generating Station, both of which are owned and operated by Santee Cooper. We acknowledge that President Trump signed on April 8 a Presidential Proclamation that provided MATS compliance extensions to many coal-fired generating units that had initially applied for the Presidential Exemption last March. However, it is our understanding that additional electric utilities will be afforded the same opportunity to apply for the Presidential Exemption through a second proclamation that would be issued in the near term. Santee Cooper requests that EPA include in this second proclamation the attached application requesting a Presidential Exemption for the Santee Cooper's Cross and Winyah Generating Stations.

Santee Cooper appreciates your attention on this important matter. Please contact me regarding any matters pertaining to Santee Cooper's application.

Thanks,

santee cooper

Good afternoon Abbie,

I hope you are doing well and you all are hanging in there with the ongoing shutdown. We are thinking of you all and hoping it comes to an end soon.

I am reaching out because we had one of our steel manufacturers reach out with a question regarding the President's July 17th President Proclamation declaring regulatory relief for stationary sources from the Taconite Iron Ore Processing NESHAP. Regulatory Relief for Certain Stationary Sources to Promote American Iron Ore Processing Security – The White House

Do you know who would be running point for the exemption process in the White House or at EPA? Any information you can provide would be greatly appreciated!

Happy to chat if that is easier too.

Thanks!

Subject: Rep. Luttrell - Huntsman HON Rule

Hi Air Team,

I wanted to flag this request for you from Rep. Luttrell.

> "Hope you are well! Huntsman who has a facility in our district applied for a Presidential Exemption under the Clean Air Act to provide relief imposed by a 2024 EPA rule known as the HON Rule. The administration included it on a short list of regulations to be evaluated for Presidential Exemptions.
>
> Huntsman applied for an exemption for a few of their facilities, including in Conroe, TX which is in our district. It is our understanding that the exemption process is being handled by the National Energy Dominance Council (NEDC). We wanted to see if there's an update you all can share regarding the status. Any guidance is helpful!"

Is there any update we would be able to give them or is it not possible at this time?

Best,
Parker

Good afternoon Abbie,

I hope you are doing well and you all are hanging in there with the ongoing shutdown. We are thinking of you all and hoping it comes to an end soon.

I am reaching out because we had one of our steel manufacturers reach out with a question regarding the President's July 17th President Proclamation declaring regulatory relief for stationary sources from the Taconite Iron Ore Processing NESHAP. Regulatory Relief for Certain Stationary Sources to Promote American Iron Ore Processing Security – The White House

Do you know who would be running point for the exemption process in the White House or at EPA? Any information you can provide would be greatly appreciated!

Happy to chat if that is easier too.

Thanks!

Mike

You don't often get email from holt.edwards@bracewell.com. Learn why this is important

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Abbie,

Thanks again for taking the time to meet with us several days ago. I wanted to follow up on the discussion we had about exemptions, specifically around the provision in §112 that allows EPA or a state permitting agency to grant a one-year compliance extension in order for regulated facilities to install control technology. The Bracewell put together some information in the attached document that we believe may be helpful to you. From our perspective, EPA should consider utilizing this authority on rules that:

1. Were finalized during the Biden Administration;
2. Have upcoming compliance deadlines; and
3. Have been identified by current EPA leadership as potentially needing revisiting.

Please take a look at the document when you have a moment. We are here to answer any questions that you may have.

Best,

Holt

Hello and Good afternoon

My name is Gina Kim and I'm a staff writer for Law360. I'm writing about the federal government's motion to dismiss a complaint filed last October by the Texas Environmental Justice Advocacy Services and several other groups alleging the Trump administration violated the Clean Air Act by postponing deadlines to comply with air pollution standards for companies in the chemical manufacturing sector.

I wanted to see if representatives for the defendants wished to issue a statement on the motion to dismiss. I can be reached at this email or at 562 217 9438. Thank you so much for your time and consideration. I hope you're having a pleasant Friday and have a wonderful weekend.

Sincerely

Gina Kim

Subject: RE: Flagging: Section 112 exemptions - Politico - DDL noon

Follow up responses:

Section 112(i)(4) specifically states that the President may exempt any stationary source "if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so."

On medical sterilizers: At this time, we're not aware of any received or granted exemptions. That would be a question for our predecessors.

Hi, Molly,

Flagging Alex's follow-up below. Please advise.

I understand the ultimate decision rests with the president, not EPA. But the process does appear to be running through EPA — it's on your website and the email does to an EPA address. So why is it inaccurate to say EPA acted to notify companies of the possibility of exemptions?

On medical sterilizers — were any exemptions received or granted? That EO sets up a process to seek an exemption, but doesn't specifically grant any, it seems. I do want to include it for context in my coverage and appreciate EPA flagging it, but want to offer the most up to date facts.

Respectfully,

To: EPA Press Office <Press@epa.gov>
Subject: Section 112 exemptions

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Hello, I'm, writing on the Section 112 exemptions EPA has offered to companies for at least nine regulations, including the MATS rule.

Has EPA received any exemption requests so far? If so, how many, and for what rules?

Why the March 31 deadline? Can't facilities seek an exemption at any time?

Has EPA ever before issued a presidential exemption under Section 112? I haven't been able to find any prior instances of that and wanted to check.

Does EPA wish to offer any other comment?

My deadline is noon.

Thank you,

To: EPA Press Office <Press@epa.gov>
Cc: Hannah Northey <hnorthey@eenews.net>; Szabo, Aaron <Szabo.Aaron@epa.gov>
Subject: White House compliance delay re commercial sterilization facilities NESHAP

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Hi folks:

Together with my colleague Hannah Northey (copied here), I'm working on a story for tomorrow that will note the White House's decision to grant a two-year compliance extension (https://www.whitehouse.gov/presidential-actions/2025/07/regulatory-relief-for-certain-stationary-sources-to-promote-american-security-with-respect-to-sterile-medical-equipment/) to some plants covered by the strengthened NESHAP rule for medical sterilization facilities promulgated last year.

The story may also note that Aaron Szabo, President Trump's nominee to head the Office of Air and Radiation, previously lobbied for the Advanced Medical Technology Association, which has a close interest in that rule. Did Mr. Szabo have any involvement in the White House's decision to grant the two-year compliance delay or in EPA's processing of applications from companies seeking the delay?

Our deadline is 11 a.m. tomorrow.

Thanks,
Sean

Hi Molly,

Flagging another follow-up. Let this lie?

Thanks for your reply which, I have to respectfully note, still doesn't directly address my question. As you know, EPA created the email inbox to receive applications for this program. Does EPA then have any role in vetting applications for consistency with the program criteria? Or does EPA simply forward the applications with no review to the White House?

Respectfully,

Subject: Sec. 112 (i)(4) Presidential Exemption program/emails released by the Environmental Defense Fund

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Hi folks:

I'm writing a story this afternoon on the emails released today by EDF as noted in the news release below. The story will probably focus on what the emails show about the previously undisclosed level of EPA involvement - by both political appointees and career staff - in setting up the exemptions program and also that EPA was actively soliciting exemption applications from affected industries.

In that context, I wanted to see whether EPA has either any comment generally on the emails and/or any specific response to the statement below by Mr. Yates.

My deadline is 4 p.m. today. On the record responses, please.

Thanks,
Sean

Trump EPA Political Appointees Scrambled to Offer Free Pass to Pollute

Newly obtained internal emails offer window into industry insiders' influence over federal agency's decision-making

(WASHINGTON – September 25, 2025) Trump Administration political appointees with ties to industry orchestrated the process to invite industrial pollution sources to request exemptions from key Clean Air Act standards, according to internal emails obtained by Environmental Defense Fund. These important pollution limits – now being undermined by industry and Trump appointees – protect the public from toxic air pollutants like mercury, arsenic and chromium emitted by coal-fired power plants and from hazardous air pollutants released by chemical manufacturing facilities and other large industrial sources.

"The Trump EPA issued a sweeping invitation to hundreds of large industrial facilities to apply for a pass to pollute, and now we know that senior political appointees at EPA – who in the past worked for industry groups to weaken pollution limits – played a central role in designing the process to collect and facilitate industry requests," said EDF Clean Power Attorney Richard Yates. "People have a right to know why and how their government is allowing facilities to emit more dangerous, toxic chemicals into the air they breathe, and these records show that Trump EPA officials with industry ties are helping polluters call the shots."

In March, EDF filed a Freedom of Information Act (FOIA) request seeking all records related to EPA Administrator Lee Zeldin's offer of exemptions-by-email and then filed suit in April after the agency failed to produce the records or otherwise respond to the FOIA request by the legal deadline. Read more about the lawsuit here.

President Trump has now granted exemptions to more than 160 polluting facilities across the U.S. Nearly two million Americans live near a facility that has received one of these exemptions.

Section 112(i)(4) of the Clean Air Act requires that, in order to grant an exemption from pollution standards, the President must determine that the technology to implement the pollution standard is not available and that an exemption is necessary for national security. The newly released records underscore the Trump EPA's central role in soliciting and facilitating companies' requests for exemptions as well as its hand in the processing of submitted applications.

Key findings from the records **include**:

- **Exemptions process was driven by Trump political appointees with industry ties:** The design of the exemption process and website for industry appears to be driven primarily by EPA political appointee Aaron Szabo, Assistant Administrator of the Office of Air and Radiation, formerly a lobbyist for energy clients such as Duke Energy and the American Fuel and Petrochemical Manufacturers Association (AFPM), as well as a contributor to the EPA chapter of Project 2025's deregulatory blueprint (see, e.g., pages 63, 203).
- **EPA met with industry representatives ahead of exemptions announcement:** Talen Energy, the parent company of the Colstrip coal plant in Montana, met with Trump EPA appointee Abigale Tardif multiple times last spring. The Trump administration later granted the Colstrip plant an exemption from standards for mercury and other toxic pollutants.
- **Development of the exemptions process was rushed and confused**: Several records indicate that EPA career staff did not have information about the exemption process being developed or did not have advance awareness of parts of the announcement (see, e.g., pages 62, 196).

More details are available in this fact sheet.

Following the March 31 deadline for submitting applications, the President announced on April 8 that an undisclosed number of coal plants would be exempted from standards for mercury, arsenic, chromium and other toxic pollutants. On April 14, for the first time and following an EDF FOIA request for public disclosure of the exempted facilities, the list of 68 coal plants exempted from Clean Air Act standards appeared on EPA's website. EDF, alongside 11 other

environmental and community groups, brought suit challenging these exemptions in the U.S. District Court for the District of Columbia and the U.S. Court of Appeals for the D.C. Circuit.

The President issued several more proclamations in July, exempting numerous additional sources from other industries, including chemical manufacturing, medical equipment sterilization, taconite iron ore processing, as well as three more coal plants.

Note that EDF has redacted, in blue, the names and identifying information of EPA career staffers from the records obtained via FOIA. Civil servants are under unprecedented attack by the Trump Administration.

Hello and Good afternoon

My name is Gina Kim and I'm a staff writer for Law360. I'm writing about the federal government's motion to dismiss a complaint filed last October by the Texas Environmental Justice Advocacy Services and several other groups alleging the Trump administration violated the Clean Air Act by postponing deadlines to comply with air pollution standards for companies in the chemical manufacturing sector.

I wanted to see if representatives for the defendants wished to issue a statement on the motion to dismiss. I can be reached at this email or at 562 217 9438. Thank you so much for your time and consideration. I hope you're having a pleasant Friday and have a wonderful weekend.

Sincerely

Gina Kim

Subject: Question about E&E media inquiry, deadline 4pm

Hi Abbie, Aaron, and Alex,

Do you have a moment to chat about the below? I will pop by your offices whenever convenient.

Our usual response to this is:

Ex. 5 Deliberative Process (DP)

Brigit
202-817-6939

From the Reporter:

Hi folks:

I'm writing a story this afternoon on the emails released today by EDF as noted in the news release below. The story will probably focus on what the emails show about the previously undisclosed level of EPA involvement - by both political appointees and career staff - in setting up the exemptions program and also that EPA was actively soliciting exemption applications from affected industries.

In that context, I wanted to see whether EPA has either any comment generally on the emails and/or any specific response to the statement below by Mr. Yates.

My deadline is 4 p.m. today. On the record responses, please.

Thanks,
Sean

Trump EPA Political Appointees Scrambled to Offer Free Pass to Pollute

Newly obtained internal emails offer window into industry insiders' influence over federal agency's decision-making

(WASHINGTON – September 25, 2025) Trump Administration political appointees with ties to industry orchestrated the process to invite industrial pollution sources to request exemptions from key Clean Air Act standards, according to internal emails obtained by Environmental Defense Fund. These important pollution limits – now being undermined by industry and Trump appointees – protect the public from toxic air pollutants like mercury, arsenic and chromium emitted by coal-fired power plants and from hazardous air pollutants released by chemical manufacturing facilities and other large industrial sources.

"The Trump EPA issued a sweeping invitation to hundreds of large industrial facilities to apply for a pass to pollute, and now we know that senior political appointees at EPA – who in the past worked for industry groups to weaken pollution limits – played a central role in designing the process to collect and facilitate industry requests," said EDF Clean Power Attorney Richard Yates. "People have a right to know why and how their government is allowing facilities to emit more dangerous, toxic chemicals into the air they breathe, and these records show that Trump EPA officials with industry ties are helping polluters call the shots."

In March, EDF filed a Freedom of Information Act (FOIA) request seeking all records related to EPA Administrator Lee Zeldin's offer of exemptions-by-email and then filed suit in April after the agency failed to produce the records or otherwise respond to the FOIA request by the legal deadline. Read more about the lawsuit here.

President Trump has now granted exemptions to more than 160 polluting facilities across the U.S. Nearly two million Americans live near a facility that has received one of these exemptions.

Section 112(i)(4) of the Clean Air Act requires that, in order to grant an exemption from pollution standards, the President must determine that the technology to implement the pollution standard is not available and that an exemption is necessary for national security. The newly released records underscore the Trump EPA's central role in soliciting and facilitating companies' requests for exemptions as well as its hand in the processing of submitted applications.

Key findings from the records **include**:

- **Exemptions process was driven by Trump political appointees with industry ties:** The design of the exemption process and website for industry appears to be driven primarily by EPA political appointee Aaron Szabo, Assistant Administrator of the Office of Air and Radiation, formerly a lobbyist for energy clients such as Duke Energy and the American Fuel and Petrochemical Manufacturers Association (AFPM), as well as a contributor to the EPA chapter of Project 2025's deregulatory blueprint (see, e.g., pages 63, 203).
- **EPA met with industry representatives ahead of exemptions announcement**: Talen Energy, the parent company of the Colstrip coal plant in Montana, met with Trump EPA appointee Abigale Tardif multiple times last spring. The Trump administration later granted the Colstrip plant an exemption from standards for mercury and other toxic pollutants.
- **Development of the exemptions process was rushed and confused**: Several records indicate that EPA career staff did not have information about the exemption process being developed or did not have advance awareness of parts of the announcement (see, e.g., pages 62, 196).

More details are available in this fact sheet.

Following the March 31 deadline for submitting applications, the President announced on April 8 that an undisclosed number of coal plants would be exempted from standards for mercury, arsenic, chromium and other toxic pollutants. On April 14, for the first time and following an EDF FOIA request for public disclosure of the exempted facilities, the list of 68 coal plants exempted from Clean Air Act standards appeared on EPA's website. EDF, alongside 11 other environmental and community groups, brought suit challenging these exemptions in the U.S. District Court for the District of Columbia and the U.S. Court of Appeals for the D.C. Circuit.

The President issued several more proclamations in July, exempting numerous additional sources from other industries, including chemical manufacturing, medical equipment sterilization, taconite iron ore processing, as well as three more coal plants.

Note that EDF has redacted, in blue, the names and identifying information of EPA career staffers from the records obtained via FOIA. Civil servants are under unprecedented attack by the Trump Administration.

###

With more than 3 million members, Environmental Defense Fund creates transformational solutions to the most serious environmental problems. To do so, EDF links science, economics, law, and innovative private-sector partnerships to turn solutions into action. edf.org

Sean,

"Decisions to grant compliance extensions is an authority that rests with the President." You can attribute the response to Molly Vaseliou, EPA spokesperson.

On background: To be more explicit because you don't seem to understand, EPA is not involved in which sector or which facility receives a PRESIDENTIAL EXEMPTION but then again you actively didn't cover Avi Garbow working at Patagonia and at EPA on PFAS at the same time, so we're not holding our breath to see any shred of truth printed behind the paywall.

Thanks,
EPA Press Office

Received. Can you directly address my question as to whether Mr. Szabo had any involvement in the decision to grant compliance extensions to some commercial sterilization facilities? Also, to whom can I attribute this response?

Best regards,
Sean

As we've shared with you many, many times.

Section 112(i)(4) specifically states that the President may exempt any stationary source "if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so." This is squarely a presidential authority.

Unlike the revolving door of staff of our predecessors that went so far as taxpayer handouts to political donors, supporters, and employers—and this is before bringing up their walking ethics violations—every Trump political appointee works with the career employees in the EPA Ethics Office to ensure all applicable ethics obligations are addressed.

Any insinuation otherwise is journalism malpractice, but then again we don't have high expectations from E&E News.

Hi folks:

Together with my colleague Hannah Northey (copied here), I'm working on a story for tomorrow that will note the White House's decision to grant a two-year compliance extension (https://www.whitehouse.gov/presidential-actions/2025/07/regulatory-relief-for-certain-stationary-sources-to-promote-american-security-with-respect-to-sterile-medical-equipment/) to some plants covered by the strengthened NESHAP rule for medical sterilization facilities promulgated last year.

The story may also note that Aaron Szabo, President Trump's nominee to head the Office of Air and Radiation, previously lobbied for the Advanced Medical Technology Association, which has a close interest in that rule. Did Mr. Szabo have any involvement in the White House's decision to grant the two-year compliance delay or in EPA's processing of applications from companies seeking the delay?

Our deadline is 11 a.m. tomorrow.

Thanks,
Sean

Hi Molly:

Thanks for your reply which, I have to respectfully note, still doesn't directly address my question. As you know, EPA created the email inbox to receive applications for this program. Does EPA then have any role in vetting applications for consistency with the program criteria? Or does EPA simply forward the applications with no review to the White House?

Best regards,
Sean

[SEQ CHAPTER \h \r 1]OAR Meeting Request Form
Abigale Tardif

Date of this Request: February 27, 2025
Scheduling Point of Contact: [redacted]

Subject: Commercial Sterilizers NESHAP RTR and CAA section 112(i)(4) "Presidential Exemption" Compliance Extension.

Purpose: Provide summary of EPA's 2024 Commercial Sterilizers NESHAP RTR rulemaking, litigation status and petitions, and discuss the CAA section 112(i)(4) Presidential compliance extension process.

First possible date for meeting: March 5, 2025 (note: 2:00 to 2:45pm on 3/5/2025, if possible)
Last possible date for meeting: March 7, 2025
Duration: 45 minutes
Reasons for Requested Dates/Duration: We believe it would be beneficial to have this briefing before the OAR meeting with industry on 3/6/2025 titled "Clean Air Action Section 112."

Requested Meeting Format (select one):
Virtual
__X__ Hybrid (in-person and virtual option; pending in-office availability of leadership team)

Invitees (please list invitees by Office and in the following format: *Last.First, (ex. Blossom.Cherry,)*

OAR
Tardif, Abigale; Dominguez, Alexander

OAQPS
[redacted]

OGC
[redacted]

*Please submit this OAR internal meeting request form to [HYPERLINK "mailto:OAR_Scheduling@epa.gov"]

*Briefing materials should be submitted to [HYPERLINK "mailto:OAR_Briefings@epa.gov"] by 3 pm one working day prior to the meeting

Form updated January 2024

Good Morning, Abbie ~

It was a pleasure meeting you last week.

Two things I wanted to make you aware of:

1) The MATS 2yr exemption request for Colstrip was submitted on Friday (a copy is attached).

2) I'd like to schedule additional time with you to discuss MATS and other air reg priorities for Talen.

Regarding #2, please let me know what will work for your schedule.

Thanks!

Brian,

Let me check with his scheduler to see if that is possible, but I know his week is rather full for next week. If not, I am happy to talk to you about the MATS rule and other air-related issues. As a reminder, you can submit information related to a Presidential Exemption under Section 112 by COB Monday if you have not already (see press release).

Thanks,

Aaron Szabo

Thanks Tala.

Aaron, I would love 15 minutes with Administrator Zeldin to chat about MATs and the new rules impact on the Colstrip plant in Montana. Anything you can do to make that happen would be much appreciated.

As a bit of a teaser, the new rules requires Colstrip move from 99.6% efficient to 99.8% efficient regarding particulate matter. It appeared to us that rule was changed in order that the owners of Colstrip would be forced to close Colstrip to forego the $500 million baghouse investment necessary to comply with the new rule. Colstrip is necessary to Montana for resource adequacy purposes and to be available when the temperatures are -40 and the wind isn't blowing. It is ludicrous that our customers would have to cover the costs of a $500 million investment for such a slight improvement in particulate matter capture. Anything you can do to help would be much appreciated.

I can make myself available for a call with Mr. Zeldin any time during the week of March 31st.

Thanks, for your consideration,

Brian

Aaron,

Please allow me to connect you to Brian Bird, CEO of NorthWestern Energy. If possible, he would love to meet with Administrator Zeldin.

I will let you all take it from here!

Thank you so much and please let me know if I can help in any way.

All the best,

Tala

Subject: RE: Potential Presidential Exemption

I'll defer to Aaron on [Ex. 5 Deliberative Process (DP)] there's more than enough evidence to support that given the way these regs were written by the prior admin.

Subject: Potential Presidential Exemption

Hey Emily,

Under the Clean Air Act Section 112(i)(4), the President may exempt for up to 2 years (and continue each 2 years) any compliance requirements if the President determines that (1) the technology is not available and (2) it is in the national security interests of the United States. To note, the President would need to report to Congress for each exemption.

During the Biden Administration, the Biden EPA developed 112 requirements (known as NESHAPs) for the following industries. I would recommend tha[redacted] Ex. 5 Deliberative Process (DP)

Ex. 5 Deliberative Process (DP)

- Coal power plants (known as the MATS rule);
- Integrated Iron and Steel Manufacturing;
- Portland Cement;
- Commercial Sterilizers for medical devices and spices;
- Synthetic Organic Chemical Manufacturing Industry (known as the HON rule);
- Gasoline Distribution Facilities and Gasoline Distribution Bulk Terminals;
- Rubber Tire Manufacturing;
- Coke Ovens;
- Lime Manufacturing Plants;
- Lead Acid Battery Manufacturing;
- Primary Copper Smelting; and
- Taconite Iron Ore Processing.

Good Morning, Abbie ~

It was a pleasure meeting you last week.

Two things I wanted to make you aware of:

1) The MATS 2yr exemption request for Colstrip was submitted on Friday (a copy is attached).

2) I'd like to schedule additional time with you to discuss MATS and other air reg priorities for Talen.

Regarding #2, please let me know what will work for your schedule.

Thanks!
